THE ELECTRICIAN

Established 1861. *The Oldest Weekly Illustrated Journal of*

Electrical Engineering, Industry, Science and Finance

VOLUME CIV.

From January 3, 1930, to June 27, 1930

[ALL RIGHTS RESERVED]

LONDON:

Printed by W. H. SMITH & SON LTD., The Arden Press, Stamford Street, S.E.1, and Published by BENN BROTHERS LTD., at Bouverie House, 154, Fleet Street, London, E.C.4.

INDEX TO "THE ELECTRICIAN."—VOL. CIV.

SUB-HEADINGS IN GENERAL INDEX.

	PAGE
Exhibitions	ii
Institution of Electrical Engineers	iii
Legal Intelligence	iii
Obituary	iii
Parliamentary	iii
Reviews of Books	iii
Telegraphy	iv
Telephony	iv
Wireless Telegraphy and Telephony	iv
Works, Descriptions of	iv

Names of Authors of Articles and Papers are indexed alphabetically in the GENERAL INDEX, *and not under the sub-headings.*

General Alphabetical Index.

Heavy figures **denote that the subject matter is in the "Editorial Notes." When the letter (C) is placed after a title, it signifies that the article in question appeared in the Correspondence columns.**

A

Abbreviations, Technical: [" H. H."] (C), 142; [Stanley] (C), 174; [Berkeley] (C), 208; ["H. H."] (C), 276
Accident Figures, American, **426**
ADAM, J. REID: (C) Defeatist Publicity, 306
Advertising, Electrical, 178
Advertising, Propagandist [Tyson] (C), 11; [Simmons] (C), 40; [Dunville] (C), 40
Africa, Southern, Electrical Market of, 822
Agreement Between English Electric and Westinghouse Companies, 760
Alloy, New Nickel-Iron, 330; [Garnett] (C), 438
Appliances, Domestic Electrical, 72, 373, 502, 623, 803, 829
Appliances, Domestic, Women's Views on [Moss], 369
Appointment, New, for Mr. J. W. Beauchamp, **604**
Arc Rectifiers, High Power [Wales] (C), 335
Architect, Electrical Industry and the, **294**
ARMSTRONG, Dr. E. F.: State Line Power Station, Chicago, 301
Association of Supervising Electrical Engineers, Annual Dinner, 262
Australia and the British Electrical Manufacturer, 763

B

BAGGS, J.: (C) Supply Authorities and Radio Apparatus, 765
Banquet of 1894, Pioneer Electric [Durtnall], 612
Banquet, John Benn Hostel, 703, 708
BARHAM, B.: Contracts in Electrical Practice, 588
Battery Testing, 560
Batti-Wallah's Luncheon, **323**, 331, 558, 712
Belgium, Power Supply in, 258
BENN, SIR E. J. P.: Unemployment and Work, 550, 582, 618, 643, 701, 736, 761, 791, 824
BERKELEY, J. J. C.: (C) Technical Abbreviations, 208; Kaplan Turbines at Passau, 619
Bi-centenary, A Notable, 740
BICKELL, S. F.: Cost of Electric Cooking, 64
Bill, Coal Mines [Woodhouse] (C), 143
Birmingham Electric Club, Report of the, 6; (opening meeting) 177; annual dinner, **354**, 368
Boats, Electric, for River Services [Durtnall], 87
Boiler House Practice, Modern [Taylor] 298, 430, 547, 727
Bolumetric Analysis of Metals [Mayfield] (C), 306
BOND, C. D.: Electrical Equipment of Cinema Theatres, **354**, 358, 488, 615
Bookkeeping for Electrical Contractors [Withey], 67, 227, 367, 492, 614, 795
Books, Scientific and Technical, 529
Bouverie Players at the Scala, 283
BOYNTON, R. D.: (C) Dark Flashes on Lightning Photographs, 556
Breakers, Oil Circuit, Cinematograph Film Dealing With, 648
Bristol Electric Club, Annual General Meeting of the, 208
British Electrical and Allied Industries Research Association, Annual General Meeting, 197
British Electrical and Allied Manufacturers' Associations' Annual Meeting, 408
British Electrical Trade Protection Association, Annual Meeting of the, 148
British Electrical Development Association's Annual Luncheon, 387
British Industries Fair, 23, **29**, **190**, 198, 230, **251**, 267, 286, 305; [Nobbs] (C), 335, **486**, 619, 830
British Power and Light Corporation, Annual Dinner, 825
BROOKING, J. H. C.: (C) Surges on Overhead Lines, 587
Brookman's Park B.B.C. Station, 587
Budget, Taxation and the, **220**, **485**
Buildings, Public, Electricity Supply in, 228
Bulk Transmission in Germany [Rich], 135
BURR, J. W.: Electric Heating of Buildings, 684
Bury, Extensions at, 371
Business in America, Trend of, **542**

C

Cables, Loaded Submarine, 148
Cables, Oil-Filled Electric, 60
Calendars for 1930, 22, 47
Campaign, E.D.A., 208
Canada as a Market, **386**
Canada, Openings in, 254
Canadian Electrical Industry, 555; [Berkeley] (C), 619
Carbonisation, Low Temperature, 581
Carnival, N.E. Coast, E.D.A., 102, 280
Casualties, Prevention of, **354**
Changeovers, Repairs and [Pease], 167
Charges, Reduction of, 146
CHATFIELD, ALD. R. S.: Obligations of Electricity Committees, 670
Church Lighting, 563
Cinema Theatres, Electrical Equipment of [Bond], **354**, 358, 488, 615
Circuit Breakers, High Speed, **724**
CLOTHIER, H. W.: (C) Safety in Domestic Electrification, 468
Coal Mines Bill, **85**, 101
Code, New Canadian Electrical, 638
Collection of Fixed Charge, Automatic, 500
Colliery, Motors, New Specification for, 715
Colour for Domestic Fittings, **86**
Colour in Lighting, Importance of [Martin], 63
Committees, Electricity, Obligations of [Chatfield], 670
Compass, Gyro, for Gun-Fire Control, 141
Competition, E.T.B.I., 501
Competition, Industrial Designs, 177
Components, Symmetrical [Hague] (C), 175; [" W.F.C."] (C), 276
Condensers, Surface [Taylor], 164
Conductors and Corona, Aluminium [Painton], 137
Conductors, Stranded Modulus of Elasticity of, 641
Conferences:—
  Electrical Contractors' Association of Scotland, 784, **814**
  Electrical Contractors' Association, 490; (Programme), 785
  E.D.A. Salesmanship, 388, 491
  Imperial Press, 773
  Empire Press Union in Edinburgh, 830
  Paris High Tension, 23
  World Power, **2**, 467 520, 579, **782** [Ekstrom], 783, 815; [Thorpe], 783
  Tramways, Light Railways and Transport Association's Annual Conference, 833
Construction Activity in America, **252**
Contractors, Electrical, Book-keeping for [Withey], 67, 227, 367, 492, 614, 795
Contractors, Electrical, Registered List of, 47, 210, 505, **514**, 623, 800
Contracts in Electrical Practice [Barham], 588
Conventions:—
  Incorporated Municipal Electrical Association, 518, 640, 653, **666**, 667, **723**, 730; Sixth Advertising, 817
Conversazione, Royal Society, 645
Cooker, Electric, Service Deficiencies, **294**
Cookers, Standard, **724**
Cookers, Thermal Storage [Dover], 795
Cooking, Electric, Cost of [Bickell], 64
Cooking, Electric, Growth of [Dover], 362, 495
Copper Conductors, New Specification for, 523
CORCORAN, J. A.: (C) Government Policy and British Trade, 142
Corrosion, Line, 691
Council, Another, **486**
CROMPTON, R. E., COL.: (C) The Late Mr. Sydney Baynes, 236; Half a Century of Electric Supply, 639

D

Defeatist Publicity [Adam] (C), 306
DENT, A. E.: Municipal Showrooms, 760
Detectors, E.H.T., 102
Diaries, 1930, 22
DICKES, U.: (C) Generator Interference with Wireless, 306
Dinner, Benn Brothers' Jubilee, **116**, 151, **159**, 161
Distribution Developments, 305
Distribution, Electrical, 177
Distribution, Rural, in Ontario, **814**
Door Control, Electric, 586
DOVER, HILDA L.: Growth of Electric Cooking, 362, 495; Thermal Storage Cookers, 794
DUNTON, A. R., and MUIR, A. W.: Moulded Insulating Compositions, 192, 326; Vulcanised Fibre, 458; Varieties and Uses of Mica, 576, 757
DUNVILLE, J. A.: (C) Propagandist and Technical Advertising, 40
DURTNALL, CAPT. W. P.: Electric Boats for River Services, 87; Pioneer Electric Banquet of 1894, 612

E

East End Hostels Associations' Dinner at Mansion House, 622
East England Electricity Scheme, 575
ECCLES, DR. W. H.: Research and Wireless, 691
Economic Crisis, **353**
Education of Women [Haslett], 524
Einstein, Professor, on Space, **782**
EKSTROM, A.: Safety in Rural Electrification, 616 (C), 737
EKSTROM, A., and EKSTROM, V.: Overhead or Underground?, 406; Second World Power Conference, 783, 815
Electric Fittings Committee, Report of the, 207
Electrical Association for Women, Fifth Annual Conference, 590, 646
Electrical Association for Women, New Branch at Bradford, 176, **636**
Electrical Contractors' Association, Annual Dinner, 144
Electrical Contractors' Association (Sussex Branch) Annual Dinner, 621
Electrical Development Association for South Africa, **190**
Electrical Development Association and America, 624
Electrical Development Association, N.W. Area, Annual Meeting of, 470
Electrical Engineers' Ball, 836
Electrical Trades Association, Advantages of Membership, 765
Electrical Trades Benevolent Institution, Annual General Meeting, 590
Electrical Trades Commercial Travellers' Association, Annual Dinner, 310
Electrical Wholesalers' Federation, Annual Dinner, 225
Electricity from the Air, 760
Electricity in the Service of Women, 360
Electricity in Victoria, 344
Electricity, Output of, in America, 1
Electricity, Price of, 434
Electricity Schemes: Central Scotland, 543, **574**; East England, 575; N.E. England, 152; Northern Ireland Government's New, 652; S.W. England and S. Wales, **55**, 57, **636**, 734
Electricity Supply in Berlin, 12
Electricity Supply in Public Buildings, 228
Electricity Supply, Toronto, 311
Electricity, Use of, Canadian Progress in, 365
Electricity, World Output of, **814**
Electrification and Rural Amenities, 69
Electrification, Domestic Safety [" Grounding Crank "] (C), 79; (C), 468; [Gill] (C), 649; [Taylor, M.] (C), 556; [Tuse]
Electrification in Austria, 194
Electrification in France and Belgium, Progress of, **542**
Electrification, International, **573**
Electrification, Rural, 122, **665**; 768 (Winchester)
Electrification, Rural, Safety in, [Ekstrom], 616, (C), 737; [" Shocked "] (C), 649; [Gilbert] (C), 649
Electrification, Rural (Bedford), 242
Electrification in Great Britain, 7
Electrification, Rural, 77, **85**
Electro Farming, 729
Electro-Harmonics, Liverpool, 310
" Electrocution " [" Critique "], 493
Engineering Budget [Palen], 725
English Electric Company's Reorganisation, **160**, 170
Equipment, Manufacturers', 38

EXHIBITIONS—

  British Empire Trade (Buenos Ayres), 487, **814**

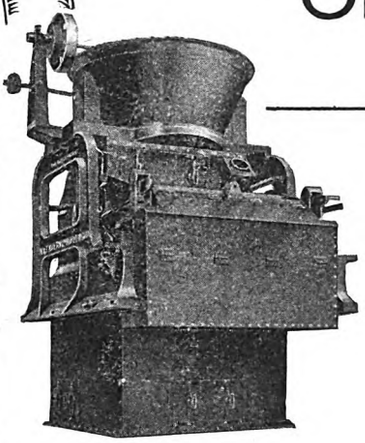
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY PATENT
AUTOMATIC WEIGHER
FOR PULVERISED FUEL
LIST 1177.

The Avery No. 52 Automatic Weigher for Pulverised Fuel gives without dust escape, correct records of fuel consumption. The machine illustrated weighs 50 tons per hour from an Overhead Storage Hopper, and delivers to the pump. Thus, accurate records of fuel consumption are automatically kept, losses are instantly detected and economy achieved.

The Specialists in handling, weighing and blending machinery. Complete plants supplied.

W. & T. AVERY, Ltd.,
Soho Foundry, BIRMINGHAM.

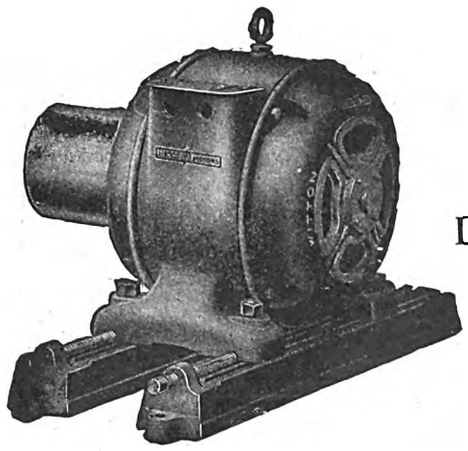
TRADE MARK
HIGGS (HM) MOTORS
PROPRIETOR WALTER F. HIGGS, M.I.E.E.
WITTON BIRMINGHAM

A.C. D.C.



If your Electric Motor drives 50 machine tools and it should fail, you may lose in wages alone £40-0-0 a day. In such circumstances how can you possibly consider a motor that is not ultra-reliable. If HIGGS MOTORS did not come within this category, it would be impossible to give a guarantee without a time limit, and remember it is the only motor in the world that has such a guarantee behind it.

Current Topics.

East African Development.

ELSEWHERE in this issue we are able to give particulars of an important hydro-electric undertaking which is about to be put in hand in Tanganyika Territory. It would appear that the value of the project to the economic position of the Territory would be materially enhanced by the inclusion of the Dar-es-Salaam district in the area of the concession. We hope that the reluctance of the local government to withdraw from the field, by disposing at a fair valuation of the inefficient plant which it now operates departmentally at Dar-es-Salaam, will shortly be overcome. Meanwhile the uncertainty is causing some delay in placing orders for the necessary plant for the Pangani Falls development.

Use of the Victoria Falls.

NEARLY a quarter of a century ago the company now known as the Victoria Falls and Transvaal Power Co. obtained a concession for 75 years from the British South Africa Company, which then administered Northern and Southern Rhodesia, for the development of 250 000 H.P. from the Victoria Falls of the Zambezi. Later, the exclusive right to deliver electricity from the Falls to the Transvaal was obtained. Lack of intermediate demand and the long distance separating the Victoria Falls from the Rand goldfield caused the postponement of development at the Falls and the company busied itself with the supply of steam-generated power to portions of the Witwatersrand mining zone. Ample supplies of cheap coal are mined immediately to the east of the goldfields and the transmission of power from the Zambezi to the chief centres of population in the Transvaal is not likely to become an economic proposition. Even in Southern Rhodesia there is not much prospect of any sufficient demand to justify expensive development at the Victoria Falls, for the Wankie colliery can supply coal at a very low price, and the larger towns, such as Bulawayo and Salisbury, are a long way from the Falls. Attempts to make a grievance of the inaction of the concessionaires, although somewhat unreasonable, appear to have induced the company to initiate negotiations with the Northern Rhodesian Government for a fresh agreement, and the Chief Secretary recently stated that a dispatch had been sent to the Southern Rhodesian Government containing specific proposals upon which full technical and legal advice from England had been obtained. As far as the company was concerned, the Northern Rhodesian Government had now arrived at almost complete agreement in regard to a further contract should such be entered into. The Chief Secretary added that the Victoria Falls and Transvaal Power Company had engaged an engineer at their own expense to report on the feasibility of a small installation at the Falls (apparently to supply current to Livingstone), and his report was expected very shortly.

Travelling Demonstration Kitchens.

VALUABLE publicity for electrical cooking is being obtained in France by means of a motor van fully equipped as an electric kitchen which has been placed on the road by the Compagnie Ouest-Lumière. The van is fitted with cooker, kettles, coffee pots, and other small apparatus. Samples of food cooked on the van and printed matter are distributed to the crowds of housewives who gather round the vehicle in the squares and market places of the towns and villages where demonstrations are given. Large dials are provided so that the consumption of current can be observed, and a supply of the smaller types of apparatus is carried for sale on the spot. Current is taken from the nearest low tension main by means of a long lead. The plan is worthy of attention by supply undertakings in this country, though there are certain difficulties to be overcome, such as the possible absence of points from which to tap the mains at places where a crowd would be permitted to assemble.

America Slowing Down.

FIGURES relating to the output of electricity in the United States during November are significant. They indicate that although there was a substantial

D

Digitized by Google

gain over the corresponding month of 1928, the rate of development has slackened. The actual increase is below the figure of normal growth as determined by past experience and reflects the slowing down of industrial activity which has followed the recent Wall Street collapse. Those parts of the country which gave evidence of the greatest increase in industrial activity during the past year now show the largest relative decline. It is in the Middle West, between the Alleghanies and the Missouri, that the recession of activity is most marked, and it is specially noticeable in the centres concerned with the automotive, steel and associated industries. The worst drought ever recorded in the Pacific Coast State of Washington persisted up to the beginning of the winter, and the diminished stream flow restricted the output of hydro-electric plants, thereby curtailing industrial activity at several centres where supplementary steam-generating plant was not available.

40 000 000 H.P.

THE National Electric Light Association estimates the production of electricity for public use in the United States during 1929 at 97 000 000 000 kWh, equal to that of the rest of the world combined. During the past seven years, 13 500 000 kW have been added to generating capacity, nearly 50 000 miles of transmission lines above 22 000 V have been built, the output of energy has doubled, and more than 11 000 000 new customers have been secured. At the end of 1929 the total generating capacity was nearly 40 000 000 H.P. These figures are a challenge to this country, and upon the manner in which it is taken up the industrial future of Britain largely depends. The Report of the Electricity Commissioners for 1928-29, which is summarised on another page, shows that real progress is being made.

Electrical Transmission in America.

CONTRARY to popular opinion in this country that America is the home of long transmission lines, the N.E.L.A. points out that reports received from 400 supply companies show that 89% of the total amount of energy is consumed in the state where it is generated. Of the remainder, 7% is sold direct to consumers outside the state where generation takes place, and 4% consists of bulk supply from one state to another for company distribution. It may, of course, be argued that American engineers are wrong, but since this short line distribution method is more or less common practice in this country also, those who look to America for enlightenment on the subject of long distance transmission are likely to look in vain, particularly when it is remembered that, in spite of the progress in interconnection which has been made in America, the average distance traversed by the average kilowatt-hour in its path from power house to consumer is only about 22 miles and, excluding the State of California, as short as 18 miles. These figures are interesting for they show that, in spite of the large area of the country, rural and industrial electrical developments are still more or less centred round the power plants and not, as many would have us believe, a good many hours' journey away from the source of supply.

World Power Conference.

IT is interesting to note that the papers which have been received for the second World Power Conference, to be held this year in Berlin, include no less than fifty of British origin. These are sponsored by such leading bodies as the Central Electricity Board, the B.E.A.M.A., the I.E.E., and others, while the list of authors includes such prominent members of the industry as Dr. RUDOLF LESSING, Sir CHARLES PARSONS, Mr. C. W. MARSHALL, and Dr. C. H. LANDER. A certain proportion of the papers will deal with the utilisation of solid, liquid and gaseous fuels in power economy, while modern steam power plants, considered as the basis of cheap power development, will also be discussed. Papers on the subject of hydro-electric systems and others devoted to the problem of electrical distribution are also anticipated. The preliminary work attaching to the Conference, in so far as this country is concerned, is in the able hands of Mr. D. N. DUNLOP, the chairman of the International Executive Committee. The fact that the British electrical industry is to be so well represented at Berlin is particularly encouraging, for with Britain in the second place of honour at the last E.H.T. Conference in Paris, the Continental impression that British electrical engineering is somewhat behind the times received a mild correction; let us hope that at Berlin it will be altogether removed.

"Light's Golden Jubilee."

WE have written so much about the unfair way in which Sir JOSEPH SWAN'S work was ignored by those responsible for the organisation of the recent celebration of "Light's Golden Jubilee" that we are glad to read in our Canadian contemporary, "Electrical News and Engineering," quite the fairest statement about the incandescent lamp invention that has yet been made public on the other side of the Atlantic. It points out that EDISON and SWAN both invented a carbon filament lamp, Swan's being the first, and then goes on to show that while SWAN was the pioneer, EDISON was the commercialist, a view which is largely borne out by the facts as we know them. It must have required no small amount of moral courage for a paper published on the American continent to champion so unpopular a cause. Congratulations to our Canadian friends on their share in doing justice to the memory of a great British inventor.

A Bad Example.

ELECTRIFIED railways ought surely to set a good example in the matter of lighting of passenger trains. The London Underground system certainly does so, but this cannot be said of either the Metropolitan or the Southern. There is a great difference on the Metropolitan between the newer coaches and some of the older stock of both compartment and vestibuled types. Worn-out bulbs of insufficient wattage, glowing a dull orange colour, make reading a severe strain on the eyesight. In the newer coaches, dazzling naked lights, which are equally bad for the eyes, are used. It would cost a comparatively small sum to fit adequate bulbs giving a diffused light, and the companies concerned would earn a large measure of public approval by doing so. Station lighting is also far from satisfactory in many cases. Inability to read a time-table owing to lack of illumination is a source of irritation which could be removed with advantage to all concerned. Stations exist at which the lights, far from good at their best, dwindle to half their normal lustre when a train enters the station section of track —just when they are most needed. This is lamentable publicity for railway travel.

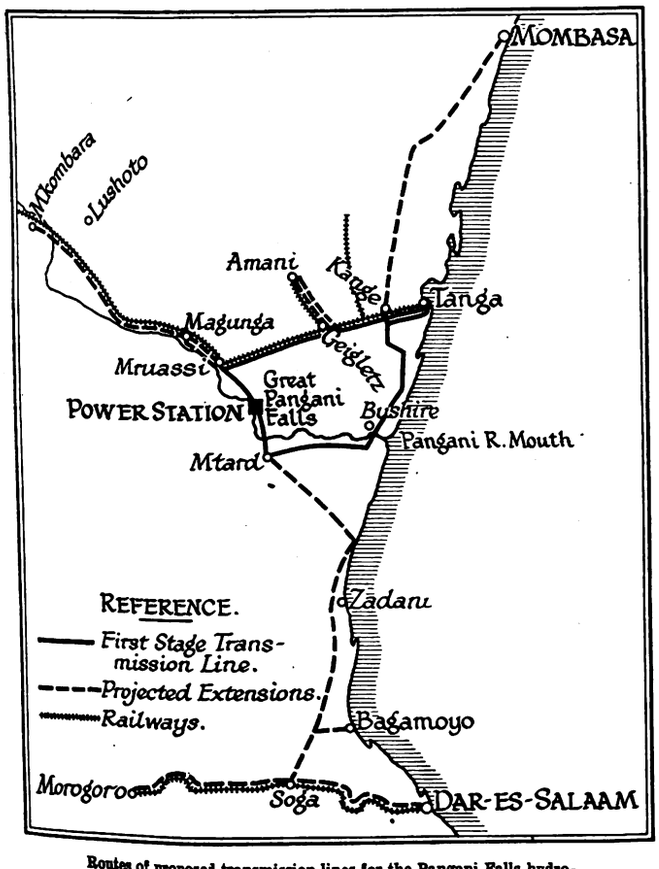
PANGANI FALLS DEVELOPMENT.

East African Hydro-Electric Undertaking—Power for Tanganyika Sisal Estates—Ring Transmission Main over 100 miles long—Future Extensions to Mombasa and Dar Es Salaam—Coming Orders for British Firms.

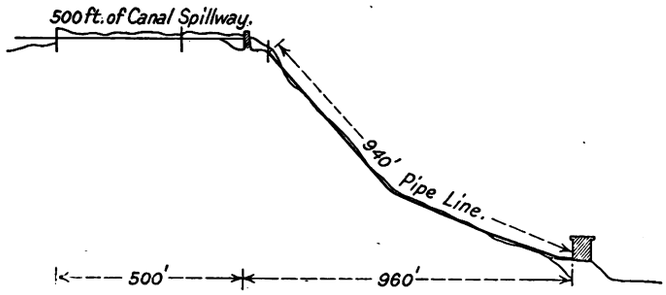
AFTER negotiations lasting for several years the Tanganyika Territory Government has accepted the tender of a British company called Power Securities Corporation for the development of electricity from the Great Pangani Falls to supply the numerous sisal estates in the immediate neighbourhood of the Falls and the port of Tanga. There is no reason why current from the Pangani Falls should not also be transmitted to Dar es Salaam and Mombasa. In the latter case no difficulty is anticipated in coming to an arrangement with the East African Power and Light Company, which operates a steam-driven plant to supply the town and port, for the linking up of the Mombasa area with the Pangani undertaking.

The position in regard to Dar es Salaam is still uncertain as the Tanganyika Government appears to have some predilection for dealing with the capital district on the basis of supplying current from a Government steam-driven plant. The present installation at Dar es Salaam is an inefficient station originally established by sappers and miners during the war to replace the destroyed German power station. Apart from the objection that it is hardly an economical policy for a Government electricity department to be maintained in such circumstances as exist at Dar es Salaam, an attempt to modernise a generating station driven by costly imported fuel when electricity produced by the use of local water power is available in the neighbourhood does not seem well advised. There is also the point that a Government scheme would involve the use of funds from the Colonial Development Loan, whereas the supply of Dar es Salaam from the Pangani development would be carried out entirely by private enterprise. The interests associated with the Pangani scheme are ready to extend their transmission lines to Dar es Salaam, and are delaying the final decision as to the size of the initial generating plant to be installed in the hope that it will be possible to reach an agreement with the Government about the Dar es Salaam district.

Great Pangani Falls are about 50 miles from the mouth of the river, which rises on Mount Kilimanjaro, and flows roughly parallel to the railway from the Kilimanjaro highlands to the port of Tanga, entering the Indian Ocean about one-third of the way from Tanga to Dar es Salaam. The average flow at Pangani Falls is estimated from actual measures at approximately 1 500 cubic feet per second with an absolute minimum of 975 cu. secs. during low water periods. The available head would vary according to the length of the canal but the maximum is 390 feet. On this basis the total quantity of power obtainable from the falls is 38 000 kW, with a minimum of 24 000 kW.



Routes of proposed transmission lines for the Pangani Falls hydro-electric undertaking.



Intake canal, penstocks and power house.

There are some 25 sisal estates in this area, and their immediate requirements of current are estimated at 4 000 kW, to which 1 000 kW may be added to cover the needs of Tanga. To meet this initial demand it is proposed to construct the necessary works for a continuous output of 7 500 kW. This would provide sufficient margin for any increase in the demand for power likely to occur in the near future.

Subject to the possibility of utilising an alternative site at Haupt Falls after final surveys have been completed, the plans provide for the construction of the generating station on the right bank of the river at Great Pangani Falls. The intake would be at a point immediately above the falls, and at this point the water would be diverted by a series of dams across the existing islands. The headworks would consist of a forebay dam at the top of riveted steel penstocks of 7 feet internal diameter and a total length of 960 feet.

The power house would be built to contain three units each, consisting of three Francis type spiral turbines direct driving electric generators having an output of 2 500 kW at 11 000 V, 50-period, three-phase current. The power station would be equipped with the necessary control gear and transformers for transmission at 33 000 V.

Transmission Routes.

For the first stage of distribution the transmission line will form a complete ring main of single line with a capacity of 5 000 kW. At suitable points sub-stations will be provided stepping down to 10 000 V for transmission to other sub-stations on consumers' premises, where the current will be again stepped down to the required voltages. There will be double circuit extensions from Kange to Tanga, and from Mruassi to Magunga, with a possible branch from Geigletz to Amani if sufficient demand exists at the latter point. Later extensions of the transmission mains would lead from Kange to Mombasa, Magunga to Mkombara (in the direction of Mount Kilimanjaro), and from Mtard via Zadani to Soga, on the railway from Dar es Salaam to Lake Tanganyika, with a short spur into Bagamoyo on the coast. From Soga the line would run east to Dar es Salaam and west to Morogoro, but this southern extension is, of course, dependent on a satisfactory arrangement being reached between the Power Securities Corporation and the Tanganyika Government for the acquisition by the power of the Dar es Salaam plant. The initial ring main will be over 100 miles long.

The Pangani Falls undertaking will involve the raising of a capital of about £500 000. It will be carried out entirely by private enterprise, and no call will be made on Colonial Development Loan funds. Orders for the plant and equipment required will be placed in Great Britain. It is expected that construction will occupy from two and a half to three years. Messrs. Balfour, Beatty & Co., Ltd., are the consulting engineers associated with the scheme.

LARGE TURBO-ALTERNATOR SETS.*

Increased Efficiency—Parallel to the Development of the Steam Engine—Size of Future Units—Peripheral Speeds—Warming Up and Cooling.

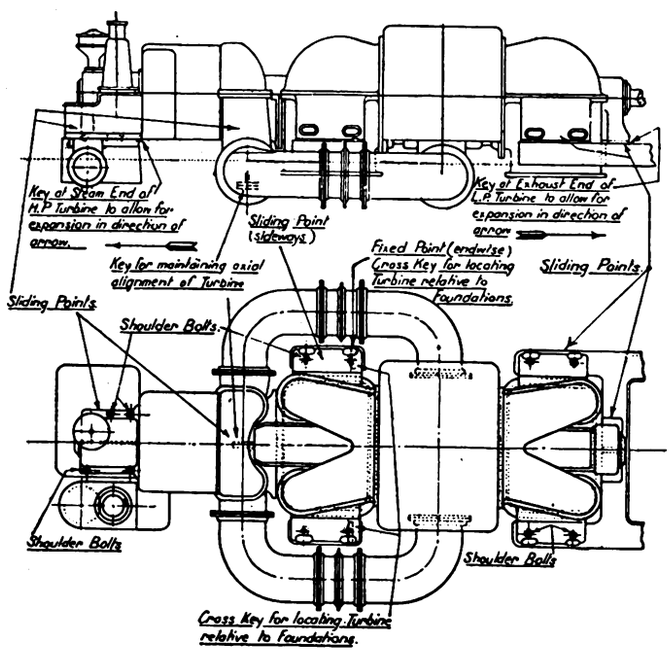
By R. LIVINGSTONE, A.M.I.E.E., A.M.I.Mech.E.

IN speaking of large turbo-alternator sets one may have in mind a machine with a large output or one of great physical dimensions, but engineers instinctively couple the two factors together when they speak of large machines, and are mainly interested in large output, and with an added interest if the output is obtained at a high speed. As the large outputs of to-day become average figures in a few years' time, the few remarks I have to make will apply mainly to machines of 20 000 kW to 100 000 kW.

That enormous progress has been made during the last 20 years in turbo-generating sets is generally admitted. As, for instance, during this period working temperatures have been almost doubled, pressures have increased nearly ten-fold and outputs a hundredfold, and the Rankine cycle has been departed from by the introduction of feed heating and re-heating, the combination of which has about halved the quantity of coal required to produce the same amount of electricity.

Progress in the manufacture of the alternators coupled to steam turbines has not been so spectacular as the progress made in turbine design during the same period. Nevertheless, the improvements effected have been sufficient to enable the output of the alternator to keep pace with the rapid growth in turbine output. At the same time the alternator efficiency for the same output has increased, and although the increase may appear small, it nevertheless represents a very considerable reduction in the total losses.

It is interesting to note that the general trend of progress is following very closely the history of the steam engine, and continuing the development started by James Watt when he separated the condenser from the engine cylinder. With



Two-cylinder double-flow turbine, showing provision for expansion.

regard to the question of distortion of large cylinders, the Serial Report of the Prime Movers' Committee of the National Electric Light Association of America of August, 1929, on page 27, gives a record of the starting cycle of large impulse turbines ranging in output from 20 000 kW to 60 000 kW, and it can be seen that the single-cylinder type of machine ranges from about 40 minutes for the smaller sizes up to as much as 180 minutes for some of the larger sizes, and the rate of loading, thereafter, is about 1 000 kW per minute in all cases. There is only one example of a tandem compound machine in the table, but general experience in this country with the multi-cylinder machine is that the starting time for 2-cylinder high-speed units is much shorter than the above figures. This indicates that the heat distortion of the high-speed two-cylinder machines is less than the large single-cylinder type.

The coal consumption required to bring large slow-speed units into full commission must be an appreciable amount, and this loss is undoubtedly diminished by the use of the smaller multi-cylinder type of turbine.

Bearing in mind the tendency towards increased pressures and temperatures, the increase in the amount of steam bled for feed heating, and the possibilities in the way of providing parallel paths at the exhaust end of a turbine, it is difficult to put a limit to the maximum size of unit at 3 000 r.p.m., even with the materials at present available. As reliability is of vital importance in large units, it is unlikely that any great departure from present-day practice will be made, but the increase in pressure, temperatures, and output may advance the three-cylinder turbine with three or possibly four flow exhaust. In this case the layout of the plant becomes almost as important as the design of a power station, and operating considerations become of even greater importance than they are with the simpler two-cylinder machines. The cross-compound arrangement, as an alternative to the tandem arrangement, has features which should be considered, but it is difficult to say at this stage of development which arrangement will prove the most suitable for the largest units.

Provision for Expansion.

Expansion of the cylinder casings must be allowed for in all sizes of turbines, and the only difference between the large turbine and the small one is that greater care is necessary in the large than it is in the small machines, because of the increased expansion. It is necessary in allowing for expansion of turbine cylinders to maintain unchanged the general alignment and running clearances.

That the forces to be taken care of are considerable can be shown by taking the very simple case of a straight pipe fixed at one end and having a forced movement at the other. With a pipe thickness equal to the bore ÷ 50 plus 1/10 inch, the minimum free length to permit of a forced movement of $\pm \frac{1}{4}$ inch with a bending stress of 10 000 lb. per square inch is $33\frac{1}{2}$ times the root of the outside diameter. The benefit of dividing the main steam pipe into two is most marked in the case of the larger areas. In the case of the smaller areas the forces acting are not greatly affected, although the free length is still considerably reduced. For large machines, therefore, the main steam connection to the turbine can well consist of two or more steam pipes in parallel. Such a device as the Aiton pipe can of course be used to reduce expansion forces. In addition to the expansion forces from the steam pipe, the weight of the pipe and steam chest is considerable and tends to distort the turbine casing. This can be overcome by spring supports under the chest, or, preferably, by a balance weight. In coupling up the steam pipe to the turbine, allowance for expansion must be made. This allowance is more than is generally realised. Taking a normal engine-room temperature of 80 deg. Fahr., and steam temperature of 700 deg. Fahr., then a pipe or bend will expand $\frac{1}{2}$ in. in 10 ft., and allowance at this rate must be made in each leg of the bend when springing the pipe into position.

On single-cylinder machines a point is reached in output when it is no longer possible to have the critical speed above the running speed. In this case the clearances must be sufficient to allow for the shaft vibration. On the multi-cylinder machine, with shorter bearing centres, the effect of this is smaller than on single-cylinder machines. It is necessary, however, to provide flexible couplings between the turbine rotors so as to prevent one rotor reacting on the other to give a combined critical speed lower than either.

In the early days of the turbo-alternator the need for close voltage regulation imposed serious limits on the design. Regulation was obtained by large air gaps and lengths of nearly saturated iron in the magnetic circuit and the stator loading was kept low. These limitations made the size coefficient $\frac{D^2lN}{KVA}$ much higher than it is to-day. With the increase in size of power systems and power units, helped to some extent by automatic voltage regulation, the need for close inherent

Digitized by Google

regulation has disappeared and the designer is free to choose that relation between electric and magnetic loading which will utilise the whole of the material to the best advantage. The result is that the ratio of stator ampere turns per pole to rotor ampere turns is to-day higher than was the practice even ten years ago.

Cooling Problems.

Concurrent with this change the problems associated with the cooling of the machine have become prominent. The various methods of solving this problem are clearly shown in Mr. Kuyser's recent paper.* There are still some difficulties to be overcome in the manufacture of large units, and these are mainly mechanical.

The mechanical design of the rotor makes it difficult to add very much to the surfaces for the dissipation of heat. The rotor losses consists of I^2R losses in the windings, fan power and air friction and pole-face losses. The copper losses can only be reduced by an increased section of copper, and the limit to this is the permissible stress in the rotor teeth and end bells.

In this country a peripheral speed of 28 000 ft. per minute has not been exceeded, although slightly higher figures are possible with the qualities of steel available. Higher peripheral speeds are used by some continental makers with alloy heat-treated steels, but in this country makers have confined themselves to the use of the lower alloy steels for large forgings which do not require any drastic heat treatment and are less liable to suffer from contraction stresses. Rotors of large diameter and with large variations in section are of course more liable to suffer from contraction stresses than small rotors of nearly uniform section. The safe peripheral speed depends to a large extent on the soundness of the forging and its freedom from initial stress, so that the factor of safety should be higher in forgings of large diameter than it need be in smaller forgings. In other words, if the safe peripheral speed for a 3 000 r.p.m. rotor is 29 000 f.p.m., the limit for a 1 500 r.p.m. rotor is about 27 000 f.p.m. for the same proportions.

As the size of ingot necessary for the production of a rotor plays a large part in the manufacture of the rotor, the approximate weights of ingots for a given output at 3 000 r.p.m. and at 1 500 r.p.m. are given in the following table :—

kVA Output	Approx. Weight of Ingot. 3 000 r.p.m.	1 500 r.p.m.
20 000	25 Tons	51 to 55 tons
30 000	32 ,,	62 to 66 tons
40 000	39 ,,	73 to 80 tons
50 000	46 ,,	85 to 95 tons
60 000	53 ,,	95 to 110 tons
70,000	60 ,,	
80 000	67 ,,	
90 000	75 ,,	
100 000	82 ,,	

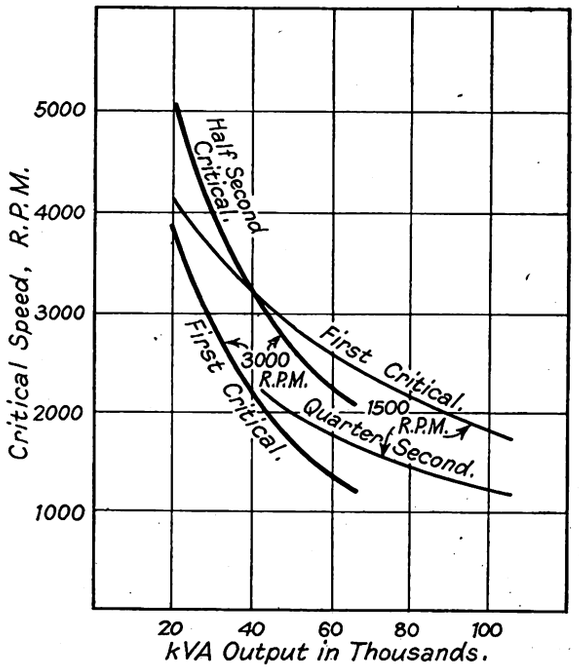
A built up rotor such as that described by Professor A. B. Field in his paper before the I.E.E. in 1915 can be used when a solid forging is impossible. This rotor was successful with a peripheral speed of 24 000 f.p.m., even with fairly deep ventilating ducts under the field coils. The built-up rotor described by Mr. Kuyser in his recent paper† before the I.E.E. is another construction which has promising features.

The forging difficulty applies only to 1 500 r.p.m. machines. In the case of 3 000 r.p.m. machines the possible output is not governed by the forging but by the critical speed and deflection of the rotor. A two-pole alternator rotor has two slightly different values for the moment of inertia of the body and a fundamental critical speed corresponding to this inertia. When the body of the rotor is short, the deflection of the shaft ends is the important factor in determining the critical speed, but with long rotors body deflection is the most important. The condition for a second critical speed higher than the fundamental is vibration with a node in the centre of the rotor.

Critical Speed Curves.

A magnetic impulse twice the normal speed for two-pole machines and four times normal speed for four-pole machines is set up when the rotor is eccentric to the stator, so that in 3 000 r.p.m. rotors the first critical speed or half the second critical should not coincide with the running speed, and in 1 500 r.p.m. alternators the running speed should not be equal to the first critical or one-quarter of the second critical speed. The critical speeds depend largely on the stiffness of the shaft ends, and the variation with output is shown graphically below for a series of rotors having the maximum rigidity of body and shaft ends, and the shortest possible bearing centres. The curves for 1 500 r.p.m. are based on solid forgings, but the actual built-up rotors have a critical speed of a value depending on the particular construction and dimensions.* In actual practice the critical speeds of both 1 500 and 3 000 r.p.m. rotors are lower than the maximum attainable on account of the presence of fans on the rotor and overhung exciter.

With regard to the high-speed rotors, at outputs under 30 000 kVA, the shaft ends are made more elastic than they



Critical speed curves for a series of rotor tests.

could be to keep the first critical above 1 500 and well under 3 000. From 30 000 to 40 000 kVA the maximum stiffness can be maintained, but above 40 000 kVA the shaft ends must again be made flexible enough to bring half of the second critical under 3 000 r.p.m. While these figures are approximate and vary with the actual design in each individual case, it is evident that so far as critical speed is concerned no new problems are encountered in the high-speed rotors with solid forgings up to about 40 000 or 50 000 kVA, and the problem of avoiding the multiples of the second critical is no more difficult than the problem of avoiding the first critical itself. 1 500 r.p.m. curves above 50 000 kVA are only of theoretical interest.

Core lengths of 220 in. are in use to-day in large American units. Such a core length would be necessary for the large 3 000 r.p.m. machines.

It is generally recognised that when starting up a steam turbine it is necessary to warm it up carefully before putting it on load, but it is not so generally recognised that the cooling-off after taking a machine off load is just as important. An important American committee has studied this subject and gives the following rules to guide the operating staffs :—

(1) That overloads in excitation be avoided.

(2) That such arrangements of ventilation be adopted as will permit as little cooling down of rotor when at rest as possible, and on no occasion permit the entrance direct of outdoor air.

(3) That a practice be established of determining temperature of field windings at stated intervals by observing volts at collector rings and comparing with that at same load conditions when generator was first put in service.

(4) That insulation resistance be measured at the same stated intervals.

(5) If for any reason at any time the rotor at rest has become very cold, run it at low speed with excitation sufficient to

bring the temperature up to 75° C. in about one-half hour before raising speed to normal.

Discussion.

Mr. A. SICHELL, urging the necessity for paying very careful attention to matters of detail during erection of large plants, pointed out that problems which, in the case of the smaller machines, were of comparatively small importance, became of very great importance in the case of the large machines in use to-day. The proper alignment of the rotating elements was a matter of very great importance. Another was that of making sufficient provision during erection to allow for the expansion which must take place. The larger the cylinder, the larger its movements, and the expansion movements of cylinders were very much larger than most people imagined. Quite serious troubles had arisen as the result of insufficient clearance having been allowed for expansion. No matter how well a plant was designed, its success as a running unit depended to a very large extent indeed upon the care exercised during erection and a proper appreciation, on the part of those responsible for its erection, of all the forces which would operate when the plant was running and was heated up. Again, if the steam pipes, and particularly the closing lengths, were fitted when the machine was cold, it was highly probable that a very heavy force indeed would be thrown upon the cylinder or steam chest when the set was heated up. Very often the closing length of pipe, when in the cold condition, was 1 in. or 1½ in. short of the length required, but when the temperature was raised to the working temperature the gap was filled by the lengthening of the pipe due to expansion forces. Again, it was not always appreciated by users that the manufacturers had to run great risks in the making of large machines as for instance, in the making of large forged rotors. Progress in the design of large machines depended entirely on the progress of the steel maker, and if the steel makers could produce steels of the necessary homogeneity and physical properties, the manufacturers of plant could produce machines having larger capacity, but of reduced size.

Mr. J. C. CALLANDER emphasised the tremendous effect of temperature upon the mode of vibration of turbine wheels, and referred to a case in which a sudden reduction of temperature in a superheater of a turbine had wrecked the machine, due to the mode of vibration having bent the wheel until it had interfered with the diaphragm.

Mr. LAW said that temperature effect, of course, was one of the things that could be predicted, because the change in the modulus of elasticity of steel due to temperature change was known very accurately. He wondered whether the trouble mentioned by Mr. Callender was really due to ordinary mode of vibration ; it appeared to him that it might have been due to a tight rim.

Mr. CALLANDER said that probably the change in temperature had started the deflection ; then the disc had touched, causing very heavy heating, which had given rise to the permanent deflection.

Mr. R. POWELL asked why marine turbines had to be turned over for eight hours with a turning engine in order to warm them up, whereas land turbines could be warmed up in about two hours ; he had heard recently of one which was ready for operation in three-quarters of an hour.

Mr. LAW replied that the old type of marine engineer was often a slave to custom ; he had been accustomed to turning his reciprocating engines slowly for hours before starting, and still continued that practice in the case of his turbines. The marine engineer, however, had not to deal with superheats anything like those that had to be dealt with by the land engineer. Some of the modern marine engineers did not adhere so slavishly to old customs, and were very fine engineers. Modern turbines in power stations had frequently to be run up and to carry full load in a very short time. If one ran them up to speed when dead cold he did not think much harm would be done, but starting up when half warm and half cold was very trying.

Mr. F. F. ELLIOTT, referring to blade vibration, asked if there were available means for predicting accurately the period of vibration of a group of blades, as distinct from an individual blade, and if it were possible by the manner of fixing to ensure that the critical vibration of that group would occur between, say, a pair of harmonics fairly well away from the fundamental vibration causing the trouble. It seemed to him that it would be almost impossible to calculate it accurately.

Mr. LAW replied that it was very difficult to predict the period of vibration of a group of blades, and it was the practice of his company to experiment on groups of blades continually. He considered that the principal value of the grouping of blades was not to alter the period, but simply to introduce some sort of damping. That was evidenced by the fact that when trouble occurred it was found nearly always to be due to the end blades.

A SPEAKER asked what was Mr. Law's view with regard to allowing large sets to run on atmosphere.

Mr. J. A. JEFFERY said he believed every designer looked with apprehension upon allowing machines to go over to atmosphere. It was a foolish thing to do.

The CHAIRMAN (Mr. W. J. Oswald) asked what was the highest superheat at which modern turbines should run.

Mr. LAW said that the limiting factor was the boiler, and not the turbine. Whatever the temperature of the steam, the turbine was always a little cooler than the steam, whereas the boiler and superheater tubes must always be a little hotter.

Mr. W. WILDE asked what were the respective merits of claw couplings and solid couplings. With regard to oil, he asked what had been done to overcome the difficulties of sludging, emulsifying, etc.

Mr. LAW, replying to the question with regard to couplings, said that each case should be decided on its merits. On the whole he considered that generally there was room for the claw couplings, and in high-class machinery it was better to have a claw coupling, at any rate between the turbine and alternator. There was a good deal to be said for the use of the solid coupling between the individual shafts of a turbine, however, because the thrusts could be distributed. The emulsifying of oils was one of the mysteries of the art. The real bugbear was the occurrence of acid in the oil ; when water got into the oil it caused it to become acid, and electrolysis could have the same effect. He referred to two old turbines at a particular station, in one of which the oil always contained an enormous quantity of water, whilst in the other there was always very bad electrolysis, but not the slightest trouble had been experienced due to the oil for many years. Three large turbines, of two different makes, had since been installed, however, and, although there was no water in the oil, and no electrolysis, all of them were producing acid at a considerable rate. Neither of the makers had yet arrived at a solution of the problem, and the oil suppliers had not been able to solve it, although the difficulty had been mitigated to some extent.

Temperature Limits.

Mr. PERCY RYCROFT, proposing a vote of thanks to Mr. Livingstone and Mr. Law, said he had been rather surprised by Mr. Law's statement that the limitation with regard to the temperature attained in turbines was not so much a matter for the turbine designer as for the boiler maker. It seemed not long ago that engineers were asked to be particularly careful not to exceed a certain temperature in these plants because the turbine builders were experiencing a certain amount of difficulty with the casings. Presumably that difficulty had been overcome, but he would be interested to know what temperature the turbine designer would like in order to give the best possible efficiency. He believed the new machines to be installed at Battersea would attain a temperature of something like 830 deg. F. If that were not enough, he could assure Mr. Law that the turbine builders had only to ask for what they wanted and the boiler makers would undoubtedly give it to them.

Mr. LAW, responding, said that no one yet knew what was the limitation with regard to temperature. A temperature of 800 deg. was being used in many power stations, and his company had made a turbine which, it was believed, would be able to stand 900 deg., by the use of special steels. This was a matter in regard to which close co-operation was necessary.

BIRMINGHAM ELECTRIC CLUB.

The report and balance sheet for the twenty-fifth session of the Birmingham Electric Club, presented at the annual general meeting on December 20th, records that further progress has been made and membership increased to 263.

During the year covered by the report six lectures, other than the Presidential Address, were delivered, attendances in all cases being good. The annual dinner was held on March 8th, some 200 members and friends being present. The annual summer outing was made to the cable works of Standard Telephones and Cables, Ltd., North Woolwich. At the Ladies' Night, held on October 18th, the President and Mrs. Forrest welcomed some 415 members and friends.

ELECTRIFICATION IN GREAT BRITAIN.

Commissioners' Report for 1928-29—Foreign Capital Interested—Increased Output of Energy—Developments under Consideration—Supply of Rural Areas.

THE ninth annual report of the Electricity Commissioners for the year ended March 31st, 1929, was published this week (Stationery Office, 3d.). It recalls that three further regional schemes prepared by the Commissioners for Central England, North-West England and North Wales and for Mid-East England were adopted with certain modifications by the Central Electricity Board. The five schemes adopted by the end of March last cover about 43 per cent. of the area and 75 per cent. of the population of Great Britain. They embrace the area of supply of some 450 authorised undertakers who accounted for over 80 per cent. of the total sales of electricity to consumers in 1927–28.

Contracts placed by the Central Board at March 31st last in respect of primary and secondary transmission lines, associated transforming stations and other works amounted to approximately £8 150 000.

In the twelve months under review the total number of units generated was 10 878 980 925, of which 9 473 201 134 were produced by authorised undertakers and the balance by railway and tramway stations and certain non-statutory undertakings. The output showed an increase of more than 9·5 per cent. on the figures for 1927–28. Since 1920–21 the production of electricity at the stations included in the returns has increased by upwards of 110 per cent., representing an average of 13·8 per cent. per annum during the past eight years. The figures also show that there has been an all-round increase of about 60 per cent. in the amount of electricity produced per ton of coal and coke consumed as compared with 1920–21. The total consumption of coal and coke in 1928–29 was 9 526 868 tons, an increase of 3·7 per cent on 1927–28, and the oil fuel consumption was 35 241 tons, a decrease of 4 800 tons.

Stations numbering 178 with individual outputs of 10 000 000 units or over were responsible for the generation of 94·7 per cent. of the total output. The remaining 386 stations collectively generated only 5·3 per cent. of the aggregate production.

Sales of Electricity.

In 1928 there was an increase of nearly 4 per cent. over 1927 in the sales of electricity by authorised undertakers and a total increase of over 108 per cent. during the six years since 1922 (an average of 18 per cent. per annum). On the basis of estimated population at the end of 1928 the sales of electricity from public sources of supply in that year represented an average consumption of 171 units per head of population. The total sales in 1928 were 7 603 240 446 units, compared with 6 850 162 808 units in 1927. It is of interest to find that the curve of estimated growth in the years up to 1940–41 prepared by the Commissioners as a preliminary to the formulation of the new Regional Schemes, forecasted the sale of about 7 500 000 000 units in 1928, compared with the actual figures of 7 603 000 000 units.

It is pointed out in regard to the sale of electricity in rural areas that one of the most important problems of the next few years will be to ensure that the additional facilities thus rendered available are utilised to the best advantage in providing an electrical service for as large a proportion of the rural population as the economic circumstances of the supply will permit. This matter has been receiving considerable attention by undertakers. The present report gives an indication of the various steps which are being taken to carry out or to secure the carrying out of supply powers and obligations; of the scope of the more important proposals and schemes for the establishment or extension of supplies in rural areas dealt with during the year or in course of preparation; and of other action in progress with these objects. It is shown that, apart from other developments not specifically mentioned, the question of providing supplies of electricity for communities located in a number of large areas in different parts of the country, covering an aggregate nearly 16 000 sq. miles of territory is actively engaging attention.

With regard to the technical and financial aspects of the development of large rural and composite areas, the particulars given in the Report serve to demonstrate that :—

1. The establishment of the "grid" system will play an important part in rural electrification by providing and facilitating the provision of additional points of supply;

2. Rural development if carried out by authorised undertakers on a reasonably comprehensive basis will involve the provision of a large amount of secondary transmission lines in the areas concerned, and

3. The prospects of a public supply being afforded to the smaller communities are likely in many cases to be dependent upon the presence of a secondary transmission line within sufficient proximity to constitute an economic source of supply.

The two last considerations point to the necessity for devoting special attention to the lay-out of and capital expenditure on secondary transmission if the sparser population and load are to be catered for on a remunerative basis. The situation cannot be adequately dealt with on the basis of sporadic and irregular extensions as and when demand arises, but only by careful planning, at the outset, of a system for the area as a whole.

Extensive Developments.

Up to the end of March last, proposals had been submitted for the development of about 3 400 sq. miles of territory, with a population of about 460 000, involving an estimated capital expenditure of over £1 000 000 over a short period of years. These proposals were either on the point of being approved by the Commissioners or were then under consideration.

Distribution developments in rural areas for certain undertakings, as at March 31st, 1929, were as given below :—

Undertakers (and number)	Rural Parishes Supplied. No.	Rural Parishes Supplied. Distributing Mains Provided * Miles.	Rural Parishes not Supplied. (Number).
Local Authorities (95) ..	521	1 198	876
Companies (135)	914	2 417	2 171
Total (230)	1 435	3 615	3 047

* These figures are inclusive of compulsory mains provided in the parishes at present supplied.

The Commissioners propose to continue a systematic review of the progress made in the provision of distributing mains in rural areas with a view to encouraging and facilitating the establishment of supplies. As a result of recommendations by the Conference convened by the Commissioners in June, 1928, two small committees were appointed last March (1) to consider the various kinds of charges and tariffs offered by authorised undertakers and to make definite proposals to secure a greater measure of uniformity, and (2) to consider what steps could be taken to ensure that facilities for assisted wiring and for the hire and/or hire purchase of apparatus are made available.

Generating plant for new stations and extensions of existing stations sanctioned by the Commissioners in 1928–29 had an aggregate capacity of 602 818 kW, compared with 668 357 kW in the preceding year. The three principal consents granted in respect to the establishment of new generating stations were concerned with stations for use in connection with the Regional Schemes of the Central Electricity Board. These were the Ironbridge Station for the West Midlands Joint Electricity Authority (one 50 000 kW 50-cycle set); the Clarence Dock station at Liverpool (initially one 50 000 kW and eventually two 50 000 kW sets); and the hydro-electric station at Maentwrog to contain initially 18 000 kW of 50-cycle plant.

The estimated net cost of administration of the Electricity Commission for 1928–29 was £50 450, inclusive of £3 000 for unforeseen contingencies. After allowing for a reduction of £3 450 in the previous working balance, the total amount to be apportioned amongst authorised undertakers was £47 000 against £44 000 in the preceding year. The contributions by the electricity supply industry towards the expenses of the Commissioners for the year 1928–29 involved a payment of 1·65d. per 1 000 units sold by each authorised undertaker concerned.

On the expenditure side, salaries and staff expenses accounted for £38 415, accommodation and office charges for £10 145, and the preparation of schemes for the Central Electricity Board (recoverable) for £18 068. The total actual expenditure was £68 280 as compared with an approved estimate of £81 050.

MARINE ELECTRICITY.

Movements of Important Electric Ships—The Progress of Marine Electricity Internationally—Two Novel Electric Liners of 1923—The Economics of Electric Shipping—The Power Limits of Turbo-electric Propulsion.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types," etc.)

TWO electric ships upon which the attention of the marine world has been concentrated for some time are now homeward bound, while the third is still outward bound, but will be returning to her home port early in the New Year. The "Viceroy of India" left Port Said on December 22nd, homeward bound for London. The Ellerman liner "City of Hong Kong" passed Perim on December 23rd, homeward bound for Manchester from Karachi. The P. & O. liner "Mooltan" left Melbourne on December 24th, outward bound for Sydney, N.S.W.

These are the three ships upon which the hopes and interests of two powerful shipowning groups and two big electrical companies are now concentrated. They represent, on the one hand, something that, as far as British ships are concerned, is an entirely new system of ship propulsion, and on the other hand, the two latter ships exemplify a "booster" system of propulsion which is bound to have an important effect upon existing steam-driven tonnage in need of bringing into line, power, speed, and from an economy point of view, with the modern motorship. Alternatively this electric "booster" system may be incorporated in the machinery arrangement of an entirely new ship, and by supplying current for driving the auxiliary machinery as well as the main "booster" motor or motors may effect some further very desirable ecomonies—in space and in steam.

It is felt that shipowners in general cannot help being attracted by these new ideas that the electrical companies have put before them, and that the year which is now before us is going to be an extremely fruitful one for the marine electrical industries.

The year which has just passed has been one of unparalleled success for the motor (i.e., the oil-engined) ship, because of its root economies. It has witnessed a slow but steady decline in steam-driven tonnage. That the steamer will ever disappear entirely is unlikely. Even to-day the power-driven ship has not absolutely eliminated the sailing ship. That the steamer will undergo modification and become numerically smaller is a reasonable supposition.

The greatest obstacle in the path of motorship development, or rather expansion, to-day is the electric ship. And yet the two are in no sense of the word direct rivals, because the latter can never have a universal appeal. It can never have an international appeal. It will always find favour in those countries in which the electrical industries are powerful and enterprising. Particularly, however, will it have a special attraction in countries which, by natural inclination, are wedded to steam engines, and which only sheer economics has torn from their first love.

British Interest in Electric Ships.

Thus we shall unquestionably see Great Britain ordering numbers of electric liners over the next few years. The new P. & O. order for two new ships is perhaps the thin end of the wedge. The Orient Line looks like a company which would, and should, be interested in electric shipping. . . . The Cunard Line, too, perhaps. The Ellerman Lines have led the way with the conversion of existing tonnage to the electric "supercharge" system. A further replacement—or rather conversion—programme is on hand, and more ships are likely to follow. It is unlikely that we shall see many, or indeed any, electric cargo (only) ships built in this country. There are three American all-electric cargo ships now in service, but they would not have been electric had it not been for special reasons under the U.S. Shipping Board's conversion programme. Electric propulsion is not necessarily characteristically suited to cargo ships—except in very special cases where auxiliary loads are high and in certain tank ships where steam heat is not needed in any appreciable quantity. Even so, this is particularly a case for Diesel-electric propulsion and a very attractive arrangement of steam raising can be made by means of exhaust heat boilers, oil fired when the ship is in port.

As far as signs of development are going at present it would appear that Diesel-electric propulsion is suited to smaller craft of, say, 3 000 H.P. absolute maximum down to tugs and ferryboats of 200 and 300 H.P. at the shaft. But then, because this involves the use of the Diesel engine, it is not likely to prove popular in this country. In America, because of the attractive prices at which small Diesel engines can be offered, and because of the immense number of small craft available, Diesel-electric propulsion is likely to go ahead very much in the next few years.

Scandinavian countries are making such a success of the Diesel-engined ship that they are unlikely to take much interest in the electric ship, and particularly in the electric liner. Scandinavian countries are essentially tramp ship owners, and the electric tramp is something which is unlikely to materialise. Germany has not hitherto displayed much practical interest in electric shipping, although, as I have shown in these columns from time to time, some of the most practical "paper" arrangements of high-powered electric liners have come from one of the big German marine and land Diesel-engine building companies—the M.A.N. Company of Augsburg. France, we are sometimes apt to forget, was an early sponsor of the electric ship in two cargo and passenger ships, "Cuasuja" and "Ipanema," built in 1923 for the Société de Transports Maritimes à Vapeur Marseilles. They operate between Marseilles and the River Plate via Gibraltar, Dakar, Rio, and Santos, and carry a few first-class and a number of third-class 'tween deck passengers. They have a displacement of 7 880 tons and a deadweight of 5 050 tons on a 23 ft. 2 in. load draft.

Dual Purpose Ships.

It is interesting to remark that, in common with most of the earlier electrically-propelled ships, these vessels have their propelling motor (which is of double unit type) right aft. This motor has rather an unusual arrangement, and will be of interest to those people who like to think that one of the principal justifications for fitting electric propulsion is that the ship should be able to run different "legs" of her voyage at different speeds. Actually, then, there are two motors mounted on the one propeller shaft. The forward motor develops 1 200 H.P. at 123 r.p.m., and the after one 2 800 H.P. at 163 r.p.m. These motors take current from two Ljungström turbo generators, each of 1 000 kW capacity, operating at 3 000 r.p.m. The ships are designed with a dual purpose—either to run as cargo vessels with a loaded speed of 10 knots, or as passenger ships with a speed at sea of 13 knots, and carrying two-thirds capacity cargo. This is generally on the outward run with emigrants from the Spanish emigrant ports carried in the 'tween decks. To satisfy these two conditions one or the other of the two motors is used. One turbo-generator only is used when the vessel is running as a cargo vessel, and current from this is supplied to the forward motor, the aft motor running idle. When the ship is running as a passenger ship, both turbo-generators are in use, but the forward motor is disconnected, propulsion being effected by the aft motor.

Steam is supplied by three cylindrical boilers 15 ft. 7 in. in diameter and 12 ft. 3 in. long, fitted with superheater devices. The bulk of the auxiliary machinery is driven by three-phase a.c. motors supplied, it is interesting to note, in the light of arrangements in more modern ships, through static transformers which reduce the voltage to 190. This applies only to auxiliaries used at sea. For port auxiliaries direct current is supplied at 110 V. Current for this service and also for lighting purposes is provided by a motor generator, the "motor" part of which is driven from the 190 V three-phase current. The electrically-driven auxiliaries include a refrigerating plant.

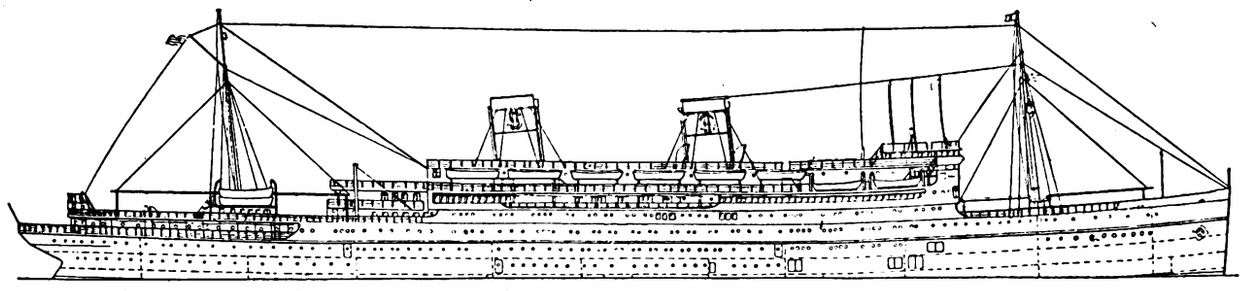
It may also be noted that although the main propelling motors are aft, there is a passage which connects the motor room aft with the power room amidships.

These two electric ships have now been in successful operation for a number of years, and they appear to have run with complete success. Perhaps that is why so little has been heard of them. Their arrangement is in many ways novel, but would appear to have the advantage of a very great flexibility, and the wear and tear on the running parts should be small. They are, I believe, the only all-electric ships in which two distinct motors are coupled to the same shaft—one motor operating in conjunction with one turbo-generator only, and the other operating with the two. So that in effect

Digitized by Google

the electric propulsion arrangement is not one double armature motor, but rather two single armature motors. The "Viceroy of India" or the "California" can operate their two propelling motors with one or with two turbo-generators in operation, but both propelling motors are running, of course, because these ships are twin-screw ships. The criticism that the marine engineer would in all probability offer against the "Guaruja" and "Ipanema" arrangement is that whichever the speed of operation, one of the propelling motors is always "idling." It would seem, in fact, that in an effort to secure a superabundance of economy the designers have virtually overlapped themselves.

The major advantage of the plant consists, of course, in the fact that the machinery on the homeward run is literally only 50% in operation, and yet a perfectly satisfactory operating speed is secured. That is, of course, always supposing that we can still accept 10 knots as a reasonable service speed for a first-class cargo vessel to-day. One feels inclined to suggest that motorship competition has forced this speed up to at least 13 knots speed, which as a fact is the stipulated speed of the ships with the more powerful of the two motors in operation. Remembering that fact, and allowing also for the realisation that these two ships were constructed some eight years ago, one is inclined to wonder whether they are as economical to-day as they were when first designed and conceived, say, some ten or twelve years ago. The march of marine progress has been swift since that date, and the Diesel-driven vessel has been no small factor in this development. But it is interesting, nevertheless, in chronicling the progress of the all-electric ship to consider the root ideas at the back of these two quite important vessels.



THE MOST POWERFUL ALL-ELECTRIC MERCHANT SHIP.

OUTBOARD profile of the new Dollar electric liner now building for round the world service. Her displacement is over 32 000 tons and her electric motors will develop 26 500 h.p.

British Progress.

If, then, America is still likely—in proportion to her relatively small mercantile tonnage—to be very active in electric ship construction, and if Great Britain is likely to be second on the map, chiefly in passenger liner category, it is interesting to inquire somewhat more deeply into the economics of the all-electric ship as we know it at the present time. For it should be distinctly understood by electric companies that at the present time the electric ship still has to make its case to the majority of shipowners.

Why exactly a shipowner uses electric ships in preference to any other type of propulsion is a question which has never yet been answered on paper. That is a point which cannot lightly be discussed. Performance figures have been issued for the electric ships of the International Mercantile Marine Corporation which compare but poorly with performance figures of similar motor-driven vessels with, say, double-acting 4-cycle Diesels in two shafts. No figures have been issued as to first cost of the electrical plant, and that, first and last, is what intrigues, interests . . . and frightens the shipowner. Even the performance of the "Viceroy of India" has only been recorded in general terms, and the ships with whose performance her own has been compared have been ships whose performance could easily be bettered anyhow by any ultra-modern machinery layout.

Those of us who have any marine "sense" at all know full well the significance of the "Mooltan," the "City of Hong Kong," and of other similar ships, and of their potentialities; but even so, we do not know in actual money what their "electric supercharge" is worth to the shipowner. Nor, one ventures to suggest, does the electrical manufacturer. He knows he is developing a right line of ideas; and unquestionably he is. The potential favourable economics of electric propulsion (whether direct, as in the "Viceroy of India" and her two new sisters, or "booster," as in the "City of Hong Kong") lies, not in what is apparent on the surface, but in what is inherent in any new form of propulsion, in any new development in engineering. We do not yet know what electric propulsion can do for us, but even the most conservative among us must at least admit that it opens up an entirely new vista in marine engineering whose position will depend largely upon the efforts of the electrical companies concerned. The shipowner will never of his own accord embrace marine electricity. He can be taught to do so, however, in the widest sense. The published results of existing electric ships will be a great factor in approaching this desirable state of affairs.

Gradually, one imagines, we shall come to a realisation of the upper and lower limits of power to which turbo-electric propulsion can be fitted. At present there seems to be no indication of this kind. For while naval vessels have been constructed with electric propulsion of about 180 000 shaft H.P. on four shafts (with two propelling motors per shaft), so, too, we have excellent examples of small all-electric craft in the 3 000 H.P. U.S. Coastguard cutters, a further order for a new unit of which has recently been placed with a Californian shipyard. These little ships are really remarkable for their compact machinery spaces, and would appear directly to controvert the suggestion that Diesel electricity is the more suitable method of propulsion for smaller craft. Extended reference was made to these vessels in my article in THE ELECTRICIAN of August 2nd last, and plans of the vessels were published. Both the 180,000 H.P. and the 3 000 H.P. units are special cases, perhaps, being naval ships. And, therefore, among the most important of electric ships now constructing is the pair of vessels laid down at Newport News, Va., for the Dollar Line's round the world service, the profile of which, as and when completed, is illustrated on this page. These ships are the most powerful electric ships at present building, because they have two twin screws, each shaft being driven by a synchronous induction motor with a continuous output of about 13 250 H.P. at 133 r.p.m.

As is usual in to-day's (but not necessarily to-morrow's) marine electrical practice, there are two turbo-generator sets. Each generator is an a.c. machine with closed circuit, air cooled, and having a continuous rating of 10 100 kW, three-phase, 4 800. V. Excitation of the propelling motors and generators is obtained from the d.c. generator sets, of which there are four, of 500 kW output. They are compound wound 240 V sets, designed to deliver 125% load for two hours.

The ships are to have a service speed of about 20 knots. They are large vessels, with a displacement of 32 280 tons on a 32 ft. shaft. The deadweight is 17 000 tons, and the cargo capacity 632 000 cu. ft., of which 67 000 cu. ft. is insulated for the carriage of Californian fresh fruit and for domestic purposes. The boiler plant comprises a battery of twelve Babcock and Wilcox water tube units with a total heating surface of 52 700 cu. ft. These details are worth studying as an example of the modern all-electric ship, for here is the type of ship which is going to provide the most effective counter to the motorship, and upon which the energies of all steam propulsion interests should be concentrated.

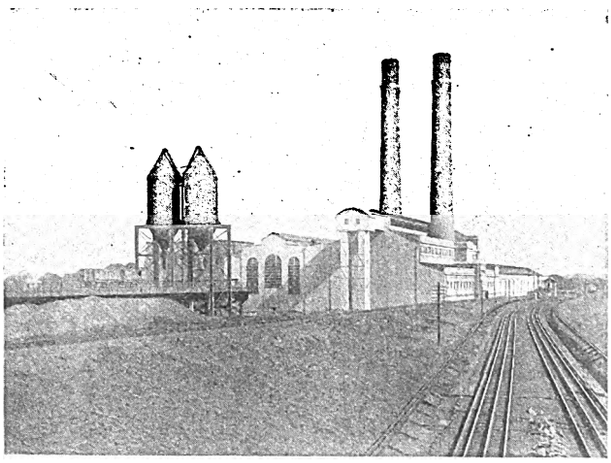
TURBO-GENERATORS AND MODERN POWER.

Probable Lines of Progress—Reduced Demand by Municipal Authorities—Railways and Lighting—Rural Supply—Good Marine and Overseas Prospects.

By W. SHARP, A.M.I.Mech.E., A.M.I.E.E.

THE object of this article is to present to engineers the probable line of progress and subsequent business prospects relative to the manufacture of high-speed alternating-current generators. The subject for consideration has a direct bearing upon the Electricity (Supply) Act, 1926, the introduction of the "grid" and the adoption of a standard frequency of 50 cycles per second.

As a result of these conditions, orders for turbine plant will be considerably reduced. This statement holds good until such time as the "grid" is in a more advanced condition,



Coal handling plant at Stonebridge Park (L.M. & S. Railway) power station, which was described in our last issue.

when we may anticipate a steady flow of orders. The effects of the new system, however, are already noticeable, so much so that, excepting in the case of emergency sets, machines for municipal authorities (in this country) with an output below 10 000 kW and even 15 000 kW are not now required. Further, in view of the fact that applications for power plant by public authorities are required to be approved by the Electricity Commissioners, it is reasonable to expect that orders for comparatively small generating units will not be considered. Consequently, with the ultimate reduction in the number of power stations, individual machines will be required to generate larger outputs (50 000 kW to 100 000 kW) and, therefore, the supply of such machines will quickly overhaul the demand. The result is obvious—the work connected with the design and manufacture of high-speed alternating-current generators for municipal authorities in the home market will become insignificant. It is, however, encouraging to know that meanwhile, neither the municipal authorities nor the Electricity Commissioners are responsible for the *whole* of the electricity supply. There are many private concerns and a number of limited liability companies which do, and will still desire to, generate their own power irrespective of the "grid."

Future of Tramways.

As regards the tram services of Great Britain, it is common knowledge that these are gradually dying out, but, while most of the smaller towns have scrapped their systems, the large industrial areas are still holding on to the service. In rural areas the omnibus is very effective, but in the city it is not so efficient; nevertheless, some routes lend themselves to bus service and we can appreciate that the tramways will be dispensed with in such places. From such considerations it is reasonable to conclude that orders for turbo-generators in respect of tramways are doubtful and for business purposes we are compelled to seek elsewhere.

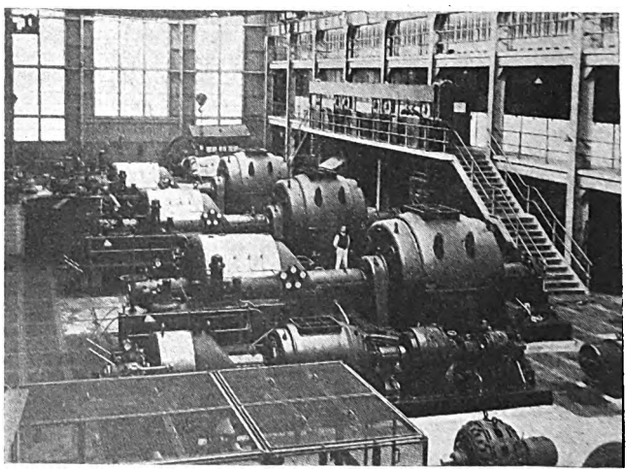
The railways, therefore, present themselves for consideration and in this case there is little fear of any real competition from the omnibus, for the simple reason that the travelling facilities on the open road cannot be compared with the comfort and safety of the railways. Another important factor is speed and, in comparison with the bus, the locomotive undoubtedly stands supreme. The steam engine, however, has now to compete with the electric locomotive, and in connection with the "grid" the electrification of the railways is already in evidence. It has been suggested that the mighty "Flying Scotsman" of the present day represents the last phase of steam locomotion, for both in London and the provinces the electric train is gradually undermining the prestige of the "iron horse." The electrification of various suburban lines in this country has shown marked economical results and consequently it is not surprising to find that the lines between Manchester and Altrincham, and also London and Brighton are being electrified. Further, in India, Japan, Canada, and still more in America, steam locomotives have given way to electrical over hundreds of miles of track. There are, however, other types of railway engines and maybe the turbo-electric locomotives, or even more probably the Diesel-electric, will be considerably developed. At the moment we are more concerned about the electrification of the railways and concurrently the manufacture of turbo-generators, and therefore we will amplify our remarks regarding the electric locomotive. It can be shown that the traction motor (for its output) lends itself to the bogie better than any other type of machine. The drive through gearing is direct on to the wheels and the speed control is much easier and more reliable than is given by any other known means. Hence, we may rest assured that with the erection of the "grid" a large number of alternating-current generators will be required to supply (indirectly) the necessary current for the various railway systems in the country.

Domestic Demands.

Coming next to domestic supply, the demand for electricity is growing rapidly and, owing to the ideal conditions attached to cooking and lighting by electricity, it is inevitable that the electrical supply for household duties will continue to increase. Such requirements, however, are receiving daily attention and are amply catered for by the various municipalities. It is evident then, that any current for domestic use will be drawn from the "grid." Town lighting—particularly railway stations (where many alterations require to be made) is another service which will be supplied by the municipal authorities.

Having given due consideration to tramways, railway electrification, domestic supply, and town lighting, we are forced to the conclusion that, in these respects at any rate, the original statement regarding the insignificance in the manufacture of turbo-generators still holds good. Let us therefore turn our attention in a direction which holds better prospects.

It has been stated that the "grid" cannot be tapped for less than 10 000 kW, the idea so far being to deliver current



Turbo-generators of 30 000 kW aggregate capacity at Stonebridge Park generating station.

only to the bus-bars of existing power stations. With the present scheme it is evident that rural areas are not yet under consideration and some time may elapse before these particular districts are supplied. Villagers and farmers, however, realise the advantages and appreciate the value of electricity, and it is reasonable to expect that they will voice their claims for electrical power. It is possible that the Central Electricity

Digitized by Google

Board will find adequate means for dealing with the difficulty and, in due course, arrangements may be made to supply such areas. Meanwhile, here is a market for the sale of electrical plant and such apparatus as is required for the production and transmission of power. On the other hand, it is probable that rural areas will require only a few thousand kW, and considering the powers of the Electricity Commissioners, private people will not instal turbo-generators. The most which can be expected from each of such areas is electrical plant up to 100 kW, and probably these machines will be slow-speed and oil-engine driven.

We now approach the most hopeful phase of the subject, namely, the application of electricity to the propulsion of ships. Such installation calls for special consideration, particularly when the current for the propelling motors is supplied by turbo-generators. In America two of the largest passenger liners, the *California* and *Virginia*, are electrically-driven and in connection with these vessels a paper entitled "Electric Propulsion as Applied to Passenger Liners" has already been published and presented by Mr. Eskil Berg to the Institute of Marine Engineers. The equipment of these ships is practically a replica of the P. & O. liner, *Viceroy of India*—a recent development which will be closely watched by all concerned. The main propelling machinery consists of two separate turbo-generators (complete with condensing plant and auxiliaries) which supply current to two slow-speed synchronous motors coupled direct to the twin propellor shafts. Owing to the large demand for electrical supply for heating, lighting, ventilation, and cooking, four auxiliary turbo-generators and two oil engine-driven generators are installed. There is no doubt that for the propulsion of passenger liners the electric drive possesses many marked advantages over the direct Diesel drive or the geared turbine drive. Nevertheless, ideal economy and compactness are more nearly approached in the Diesel engine-driven generator. On the other hand, the maintenance costs of electrical plant, barring accidents, should be considerably less than with any other type of machinery. Further, absence of vibration, ease of control, and the advantage of having full power for going astern are features possessed in a superlative degree by the electrical system. Consequently, in connection with ship propulsion we can anticipate a steady flow of orders for turbo-generators of 5 000 kW upwards.

In our quest for orders the Dominions present to us a most favourable market for the supply of turbo-generators and other electrical machinery. A most recent report dealing with the electrical development in South Africa points to the fact that the advance of electricity during the past few years has been extraordinarily rapid. In Australia the demand for electricity is even of much greater magnitude, while a number of Canadian orders for generating plant are already in this country. From foreign countries, also, many orders may be expected, particularly since our estimates are now more nearly in line with the quotations of foreign competitors.

Finally, it may be confidently stated that any work connected with turbo-generators in this country will be confined more especially to the "Grid." Small generating units up to 10 000 kW may be utilised by the Dominion of Canada and the Union of South Africa. Plant for Australia and New Zealand should be more in the neighbourhood of 10 000 kW to 20 000 kW and foreign orders of the same capacity. The title "Turbo-Generators and Modern Power" is more applicable to ship propulsion, and it is from this source that the most considerable number of orders may be expected.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Propagandist Advertising.

[To the Editor.]

Sir,—May I be permitted to congratulate you on the exceedingly comprehensive survey of 1929 in the electrical industry which you have published in the form of the first Annual Review Number of The Electrician, and at the same time to express a difference of opinion on a not unimportant point which is referred to in the able article on technical advertising by Mr. J. S. Simmons.

In the penultimate paragraph of this article the author mentions the "propagandist campaign" type of advertising and cites, as an example, the 60 ampere house service standardisation campaign conducted by one of your advertisers. It is quite clear from the remarks made that Mr. Simmons considers this to be good advertising, but I venture to suggest that such a campaign would be conducted far more effectively in the editorial columns rather than in the advertisement pages. The editor is concerned with the progress of the industry as a whole and his remarks are read with a more open mind than any recommendations of an advertiser whose attitude is largely determined by the particular axe he has to grind. Surely the correct procedure is for advertisers to support a campaign instituted by the editor, not as Mr. Simmons seems to suggest, editorial support of a campaign instituted by the advertiser.—I am, etc.,

Beddington, Surrey. J. S. Tyson.
December 31st.

BOOK REVIEWS.

A Textbook of Illumination. By William Kemerth. (London: Chapman and Hall.) Pp. x+269. 15s. net.

This elementary work is designed to serve as a text book in illumination for undergraduate students. The fact that it is an American book is, one supposes, sufficient reason for restating the mistaken idea that Edison was the inventor of the first carbon filament lamp. The field covered is fairly extensive, and chapters are devoted to photometry, mean spherical candle power, illumination measurements, direct and indirect lighting, street lighting, recreational lighting, the lighting of public buildings, residence lighting, industrial lighting, and commercial lighting.

The numerous problems and references to other sources of information add to the value of the book.

S. W. L.

Direct Currents. By Carl E. Magnusson. (London: McGraw-Hill Publishing Co.) Pp. xi+495. 22s. 6d. net.

This book sets out to present in logical order the basic principles of the electric circuit and the characteristics of direct current machines, apparatus and distribution systems. With its companion volumes on "Alternating Currents" and "Electric Transients" it is intended to form a complete text book covering the fundamental laws of electrical phenomena as applied to practical electrical engineering problems. Circuits are dealt with separately under the headings "Electric, Magnetic and Dielectric." We then pass from generation to indicating instruments, the dynamo, armature windings and reaction, generator and motor characteristics, commutation, losses, electrolysis, transmission and distribution, and thermionic and gaseous conduction. There is a final chapter on industrial applications, and an appendix deals with approved methods of treatment for electric shock.

W. L.

Worked Examples in Electrical Technology. By F. Peasgood and H. J. Boyland. (London: Humphrey Milford.) Pp. xv+219. 15s. net.

The authors are lecturers in electrical engineering at the Northampton Polytechnic Institute, London, and the object of their book is to provide the students of electrical technology with a collection of examples to supplement his other work in this subject. Carefully graded exercises are given, and these are excellent material for those who are studying for associate membership of the Institution of Electrical Engineers and other examinations of similar standing.

The ground covered is extensive, and in the majority of cases only one problem of each type is included, while at the end of each section a number of additional questions is propounded for solution. Part I deals with the direct current circuit, Part II with the magnetic circuit, and Part III with the alternating current circuit. Paper, diagrams and printing are all excellent.

H. B.

Heaviside's Operational Calculus as Applied to Engineering and Physics. By E. J. Berg. (London: McGraw-Hill Publishing Co.) Pp. xiii+214. 15s. net.

This book, mainly a reprint of a series of articles in the "General Electric Review," deals only with a very limited field of Heaviside's work, but the treatment is so sympathetic and concise that it will surely arouse greater interest among engineers and students in his operational mathematics.

Much of Heaviside's work first appeared in the columns of The Electrician, the years 1886–87 being very fruitful in this direction. Several references are made to these articles, and the book includes a brief personal sketch of Oliver Heaviside. An appendix gives Mr. B. A. Behrend's appreciation of his work in other directions which makes very interesting reading.

GENERATING PLANT PROGRESS.*

A Review of Developments Since the War—Steps Towards Higher Steam Pressures—Proposed 1 800 lb. British Installation—Capacity of Present Day Sets—America's Largest Generators.

By THOMAS ROLES, M.I.E.E.

IN the days immediately prior to the outbreak of war, the usual steam conditions obtaining in power stations in this country were pressures of from 160 to 200 lb. per sq. in. and temperatures of from 450 to 550 deg. F. There were, however, power plants on the Continent working at considerably higher steam temperatures than those usually adopted in this country, one plant operating with steam at 660 deg. F. In some large power stations boilers having an evaporative capacity up to 40 000 lb. per hr. were in use, and boiler-house efficiencies of from 65 to 75 % were attained.

As typical of turbo-alternators of the largest capacity in commission in 1914, mention may be made of the 15 000 kW three-phase set, running at 1 000 r.p.m., installed in the Stuart Street Station of the Manchester Corporation. This set had an overload capacity of 19 000 kW for thirty minutes at a power factor of 0·95. The steam conditions at the turbine stop valve were 190 lb. per sq. in., 530 deg. F., and the vacuum was 27½ in. The steam consumption at a load of 15 000 kW was 13·65 lb. per kWh. At this period a good steam plant could attain a thermal efficiency of about 15%.

Position before the War.

Up to 1914 there were no turbo-alternators of 5 000 kW or over in this country running at a speed of 3 000 r.p.m., although at least one set of 5 000 kW capacity designed for this speed was at work on the Continent. In December, 1915, however, a turbo-alternator of 6 250 kW capacity built to run at this speed, was started up in the Stuart Street Station at Manchester.

Although 15 000 kW sets were considered large on this side of the Atlantic, the erection of 30 000 and 35 000 kW single-shaft machines was commenced by the Philadelphia Electric Co. in the United States of America towards the end of 1914. The steam conditions for the 35 000 kW set were 215 lb. and 540 deg. F., the steam consumption being approximately 12·0 lb. per kWh. Had there been the demand for such large units of plant over here no doubt it would have been met by British manufacturers, seeing that a 25 000 kW turbo-alternator was being built in England for the Commonwealth Edison Co. of Chicago, U.S.A., in 1912.

The first radical departure in this country from the steam conditions which had been generally adopted was the installation during the year 1915 at the power station of The British Thomson-Houston Co., Ltd., Rugby, of steam raising plant and a turbo-alternator designed for a steam pressure of 375 lb. and a temperature of 700 deg. F.

Up to about 1917 the Edwards type of air pump had held the field for air extraction from surface condensers, but about this period the steam jet air extractor came extensively into use. For large capacity condensing plants this type of extractor has almost entirely superseded the reciprocating air pump.

In 1918 a 45 000 kW turbo-alternator was put into operation at the Connors Creek power station of the Detroit Edison Co., U.S.A. A notable feature of this set was that its generating pressure of 12 200 V was stepped up to 24 000 V by a single three-phase transformer, the largest of its kind in use at that time. This power station had achieved what was up to this period the world's record for thermal efficiency, a figure of 17% being attained with an annual output of approximately 210 000 000 kWh, a maximum demand of 50 000 kW, and a load factor of 47·8%. In this country the highest thermal efficiency reached up to that time was 16%.

The year 1918 also saw twelve boilers each having an evaporative capacity of 50 000 lb. per hr. installed in the Rotherham power station, these boilers being stated to be the largest up to then constructed in this country.

During the following year boilers of 91 000/104 000 lb. capacity were installed in the Stuart Street Station, Manchester, the steam pressure being 225 lb.

In the year 1920 the North Tees power station was started up, the first installation of steam-raising plant in which comprised ten boilers each having an evaporative capacity of 42 000 lb. per hr., operating at a steam pressure of 475 lb., and a total temperature of 700 deg. F. In this station re-heating was adopted, as were also the extraction of steam from the main turbines for feed water heating and the preheating of air to the furnaces. The turbo-alternators installed were each of 20 000 kW capacity, designed for a speed of 2 400 r.p.m.

In spite of the notable increase in steam pressure at the North Tees station and the introduction of such refinements as re-heating, the general tendency in connection with power station design was still to keep to more moderate steam conditions, as is instanced by the Dalmarnock power station of the Glasgow Corporation, which was started up at about the same time as that at North Tees. For the Dalmarnock station the steam pressure adopted was 275 lb., with a total temperature of 700 deg. F.

In 1921 a 30 000 kW set—then the largest in the country—was installed in the Rotherham power station. This machine, which was constructed to operate under steam conditions of 200 lb., a total temperature of 588 deg. F., and 28½ in. vacuum, was of the single cylinder type running at 1 500 r.p.m. The steam consumption of this machine was 11·1 lb. per kWh.

By this time boiler-house efficiencies of about 80% had been recorded and steam installations for pressures of 250 lb. had become common, and a number were either at work or under erection to operate at 350 lb. Greater developments in connection with the increase of steam pressures were, however, being made by American engineers, and a number of stations were constructed in the States in which the steam plant was designed to operate at pressures of from 500 to 600 lb., and in 1925 the Edgar station of the Edison Electric Illuminating Co., of Boston, in which steam plant to operate at 1 200 lb. was installed, commenced to operate. Since then other plants have been built in America to work at still higher steam pressures, and it is reported that two boilers will shortly be put into use over there to produce steam at a pressure of 1 840 lb. gauge.

At the present time there is still no power station belonging to a public electricity supply undertaking in Great Britain which has boilers working at a higher pressure than those at the North Tees station, and until very recently no other boilers in this country were operated at so high a steam pressure. During this year, however, several very large boilers designed to work at a pressure of 800 lb. have been erected and put into commission by the Synthetic Ammonia and Nitrates, Ltd., at Billingham-on-Tees. A boiler and turbo-alternator constructed to operate at a pressure of 1 100 lb. will shortly be put to work at Bradford, and statements have been made to the effect that a large manufacturing concern in the South of England intends to instal boilers for working at a pressure of something over 1 800 lb. per sq. in.

With regard to the size of turbo-alternators, sets are now being built in this country to operate at a speed of 3 000 r.p.m., having a capacity of 30 000 kW, at 0·8 power factor and sets of 67 250 kW capacity to run at 1 500 r.p.m. are on order for the new Battersea station of the London Power Co.

In the United States of America very much larger machines are at work, one at the Hell Gate station of the New York Edison Co., being 160 000 kW capacity, and another built for the State Line Co. of Indiana being of 208 000 kW capacity.

* From the inaugural address to the North Midland Centre of the Institution of Electrical Engineers.

ELECTRICITY SUPPLY IN BERLIN.

The Vereinig. der Elektrizitätswerke E.V., Maessenstr. 9, Berlin, W.62, has issued an abstract from "Elektrizitätswirtshaft," giving particulars of the progress of the Berliner Städtische Elektrizitätswerke A.G., and the results of a census, dated October 10th, 1929, showing the degree of household electrification reached in the company's area of supply, the purposes for which the energy is used, and the probable requirements of potential consumers. Amongst much other interesting matter in the pamphlet is a table which shows the degree of household electrification in each of the 77 divisions of Berlin. The total number of householders who returned census forms was 1 188 394, and of these 54·82% used electricity for lighting only or for lighting and domestic appliances.

INTERNAL ISOLATION SWITCHGEAR.

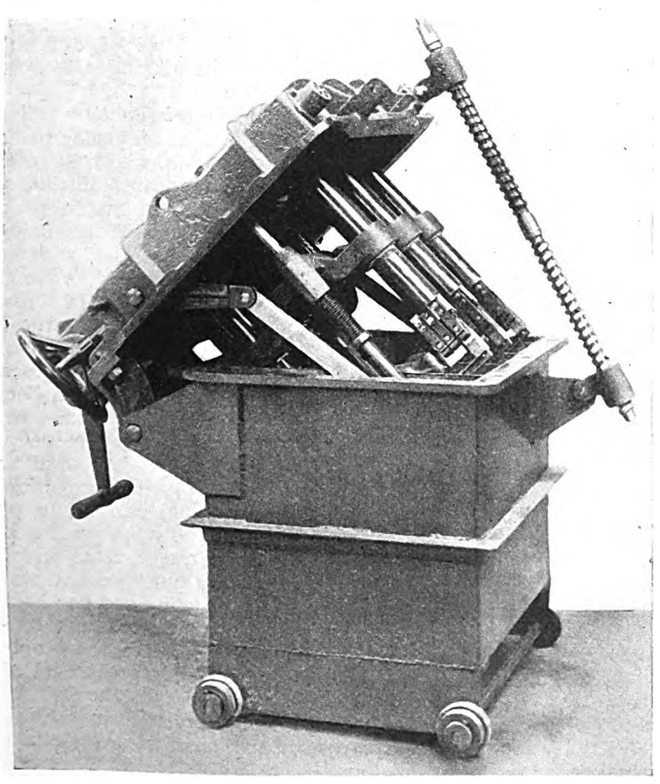
Principles of a New Design—Stationary Circuit Breaker—Elimination of Heavy Gear—Economy in Size and Weight—Self-interlocking.

THE evolution of internal isolation switchgear is the result of years of effort by switchgear designers to produce practical switchgear. They were for a long time hidebound to the conventional practice of moving the complete circuit breaker when isolating from or connecting to the line. This involved a great complication to disconnect or connect six simple plugs and sockets. Then came the inspiration of the Whitehead principle of isolation. Beginning with this embryo basic principle and advancing through designs, tests and numerous modifications the firm of Switchgear and Cowans, Ltd., produced in the short space of two years the simple internal isolation switchgear which they showed at the recent Cardiff Exhibition, in which isolation is safely and conveniently effected without moving the circuit breaker.

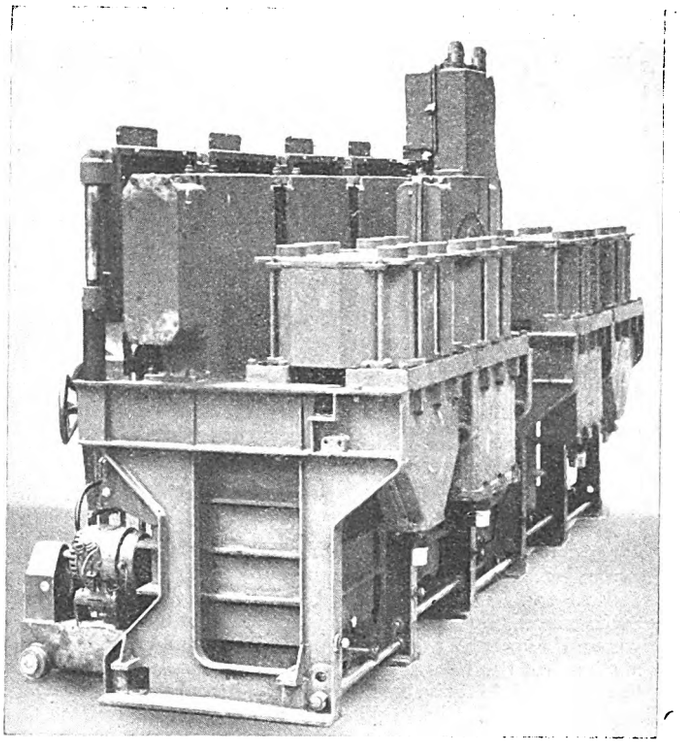
In the new switchgear the circuit breaker remains in the same position, stationary on the floor, whether connected to or isolated from the line. As the breaker is not moved horizontally nor raised or lowered vertically, all the heavy gear and framework for these purposes are eliminated. A great reduction in size and weight has been effected. All components are metal-clad, self-contained units easily removed and inspected. When it is necessary to inspect the breaker contacts the breaker is pulled out on its wheels along the floor.

The vital component of internal isolation switchgear is the moving isolating carriage, which is arranged to move up and down within the breaker tank. The six terminal stems of the breaker instead of being, as is the usual practice, fixed to the breaker top plate are mounted in insulating shrouds fixed to the isolating carriage. The terminal stems are thus employed in a dual capacity, their lower ends forming the circuit breaker fixed contacts in the usual manner, and their upper ends forming the isolating plug contacts.

These six plug contacts make and break connection with a group of six fixed terminal sockets. Three of these socket contacts are connected to the three busbars. Each of the other three socket contacts is connected through a bridge connector (or a current transformer) to the incoming cable. When isolating from the line the breaker remains stationary; the only part that is moved is the isolating carriage with its plug contacts. Raising or lowering the isolating carriage inside the breaker tank by means of a handwheel outside connects the breaker to or isolates it from the line.



Breaker contacts exposed for examination.



Back view of switchboard, showing arrangement of potential transformer and current transformers on bridge connectors and cable boxes.

When the isolating carriage is raised to connect the breaker to the line the plug contacts project through the breaker top plate and make connection with the fixed socket contacts. In this position the breaker can be operated, closed and tripped, just as if the terminal stems were permanently fixed to the top plate of the breaker.

The switchgear is self-interlocking. The sequence of operations is inherent and simple, no intricate system of complicated interlocks being necessary. When connected to the line, the breaker cannot be pulled out against the natural interlock of the plug contacts extending up into the fixed socket contacts. When the breaker contacts are closed they prevent the isolating carriage from being moved down; the breaker must first be tripped. The main current cannot be made or broken at the isolating contact, but only at the breaker contacts under oil. When withdrawn, the breaker cannot be pushed home into position with the contacts closed, as the plug contacts are then projecting above the top plate. To take any strain off the gear, these natural interlocks are supplemented by two simple interlocking bolts.

When duplicate busbars are required, busbar selection is efficiently obtained by utilising the circuit breaker as a selector switch. The only addition required is a duplicate set of three fixed socket contacts connected to the cable box terminals, while the circuit breaker is arranged to occupy two positions, each set of three busbars having, of course, its own set of three socket contacts. By this means it is possible promptly to change over from one set of busbars to the other by simply moving the circuit breaker on its wheels backwards or forwards a few inches, the plug contacts on the isolating carriage connecting one or other set of three cable socket contacts to one or other set of three busbar socket contacts.

In view of the fact that the isolating carriage is incorporated in its design the circuit breaker is of special interest, particularly so because of the ingenuity with which this has been accomplished. The top plate of the breaker is hinged and lugs are provided on the top plate and on the tank for attaching a simple screw jack. After removing the bolts in the top plate a few turns of the handwheel on the jack swings back the top plate and the breaker contacts are fully exposed for examination. The complete operation of isolating, withdrawing and opening the circuit breaker takes but a few minutes and is done in perfect safety.

TRANSMISSION AND DISTRIBUTION.

Continental Practice in Overhead Work—Lower Standard of Safety than in Great Britain—Effect on Cost of Current to Consumers.

At a meeting of the Overhead Lines Association, held at the Institution of Electrical Engineers, London, on December 18th (Mr. Theodore Stevens, the president, in the chair), a paper was read by Major Theodore Rich, honorary secretary of the Association, on "British and Continental Methods Compared."

Major Rich said that almost from the start electricity was recognised on the Continent as a public utility and not merely something to obstruct and tax. As a consequence continental engineers were the first to tackle power transmission worthy of the name, and were also the first to handle rural electrification. British engineers, however, were pioneers in generation, and reference was made to the many works put up on the Continent by Messrs. Crompton until they were boycotted by financiers at home and pushed out by tariffs. The essence of Continental transmission had been water power, and the essence of rural electrification had been low capital costs and wayleave facilities. In England progress was held up owing to the existence of internationally owned three-phase patents arranged in such a way as to keep British engineers out of the power transmission machinery and contracting market of the world.

From comparatively early days 50 periodicity was usual on the Continent. There were local exceptions, but most countries were now on a frequency of 50. For distribution, 110 to 125 V was still usual in France, Spain, Italy and Switzerland, but Germany was changing to 220, and so were the new rural areas in France. The influence of the super-stations on the Continent, except in the lignite areas around Cologne and Leipzig, had been insignificant, and where large scale transmission had taken place it had primarily been from water power and lignite power.

As regards transmission up to 150 000 V spans had not exceeded 200 metres. A large proportion of the towers were slender, the assumption being that in case of a line breakage a simple hanger would slip so that the torsion strains to be allowed for were limited. Concrete centrifugal posts had been used especially in Germany for 50 000 and 60 000 V lines, in Italy for 130 000 V, and a new line for 240 000 V, and recently in France for 90 000 V. Elaborate differential trip gears with pilots were not often used, and this did not seem to matter much. In Scandinavia, Poland and Italy the system of two uprights and a cross bar had had some vogue for very high voltages, but for transmission line protection, lightning discharge gear was out of favour. Although earthed wires above were looked upon as a valuable help it was recognised that one could not protect a line from a direct hit.

Use of Glass Insulators.

Pin insulators were used for higher voltages than in this country, a number of recent lines at 60 000 V having them, but chain insulators were being used for lower voltages. The cap type of chain insulator seemed to be more popular than the Hewlett, the extra safety of which had proved to be somewhat elusive. Glass had made extraordinary progress in France and to a lesser extent in Italy for insulators. In France, as compared with porcelain, the output was said to be 4 or 6 to 1. Glass had not become popular for suspension work.

There was still much controversy on the Continent regarding the earthing of h.t. neutrals, and it was not so usual in Germany as in other countries. According to theory if a conductor was carrying a substantial alternating current and was surrounded by a closed circuit, eddy currents would circulate in it, but he had been told by a transmission line engineer on the Continent that this had not been found to be the case. There were quite a number of transmission lines on the Continent guarded in such a way as to be complete metallic circuits, and he was told that no extra losses had been traced.

One of the advantages for transmission lines on the Continent was the existence of many wide roads, sometimes for stretches of 20 miles alongside which transmission lines were run. People were not afraid of roadside lines on the Continent, and nowhere was it necessary to use doubled insulators for roadside running. Concrete for posts had gone ahead rapidly for h.t. voltages, especially in France, and for medium transmission voltages in Germany, Austria, Spain and Italy. Also, concrete bases were used largely to replace butts which had rotted or to enable cheap local forest wood posts to be used. In some parts very light steel lattive posts were used for cross-country lines. For h.t. distribution 10 000 to 16 000 V seemed to be favoured at the present time. There had been troubles with aerial switchgear, and the like owing to shorts at contact insulators—some fatal accidents had occurred—and in France insulated pole switch platforms had to be provided, according to the new regulations.

In regard to transformer stations—brickwork, masonry or concrete having held the field for a long time—a low tension switch was used in some places operated through a door, the key being in charge of somebody in the village, so that the low tension could be cut off on emergency. Pole type transformers had come into considerable use in rural work recently, but they had not the vogue they had had in America, one reason being that the voltages were much higher. Rural distribution was in general on the open link system, controlled by fuses and aerial switches usually operated under magnetising current only. For low tension work porcelain outdoor link fuses were very common, whilst low tension distributors in insulators in front of the houses in villages and small towns were quite usual.

Discussion.

Mr. A. H. Seabrook said that the whole tendency in this country was to make things as expensive as possible, so far as electrical work was concerned. Often expensive gadgets were put on to systems, but they were usually out of use soon after they were installed.

Mr. H. Molle said he could confirm what Major Rich had said as to simplicity of Continental construction. Notable features were the use of concrete poles and glass insulators and a very simple arrangement of distribution where the conductors were carried on iron brackets on the sides of houses. In one case the practice was adopted of digging a hole in the ground, placing the transformer in it, and putting a fairly strong cover over it. The transformers kept quite cool under these conditions and gave no trouble.

Mr. W. Fennell said that one thing that had appealed to him from his limited experience of Continental work was the absence of stays on poles. There was also an entire absence of any earthing of the ironwork of poles, and that also was quite the usual thing in America. All this, of course, was very different from our methods. He had also seen some very interesting examples of bracket work in France, the brackets attached to the buildings carrying various power lines of different voltages and also telephone lines. He had some poles in the Mid-Cheshire area carrying lines of different voltages, but had not yet succeeded in getting the Post Office to put their lines on the same poles.

Mr. Napier Prentice, commenting on the reference by Major Rich that very often pole lines could be laid alongside roads on the Continent for 20 miles in a straight run, said that these long straight runs often introduced temperature difficulties. If there were a few angles things were better in that respect. Further, these long straight lines often caused humming troubles. As to lightning arresters, there was a large installation in Italy where these had been put in for 25 000 V, but he understood that the arresters were practically out of use.

Mr. L. Stanton suggested the possibility of the Overhead Lines Association formulating a sort of code as to the best methods of overhead line construction for various purposes. He maintained that it was possible to improve on both Continental and American practice, and yet do the work cheaper. As to the use of the guard round the conductors on the poles, eddy currents were insufficient to cause any effect, and he believed the idea of these guards was for lightning protection.

Major Rich, replying, said that the whole object of the paper was to draw attention to the fact that there was a great deal of overhead line construction on the Continent, from which many people received supplies of electricity which never would have received them if the pole line construction had not been exceedingly cheap. Even if in some cases the pole line construction in parts of the Continent was execrable, the people got the supply, and there did not seem to be a great deal of trouble. We were killing people by hundreds in the streets, and yet there were these very stringent regulations regarding electricity supply where the risks in any event were very much smaller. This was ridiculous.

NEWS IN BRIEF.

Hams Hall and the Public—New Showrooms for Ilford Electricity Department—Exploitation of the Narva Falls—Dundee and Foreign Cables—Steam-Electric Generation in America.

MANCHESTER Corporation requires a power station engineer.

At a meeting of the Junior Institution of Engineers on January 10th, Mr. H. J. N. Riddle will read a paper entitled "The Track Circuit in Railway Signalling."

Hammersmith (London) Electricity Committee proposes to borrow a further £6 000 for the scheme for the provision of electrical installations on hire and hire purchase.

It is understood that the British Post Office will shortly start a public service of telegraphic transmission of photographs, drawings, manuscripts, etc., to a Continental capital.

Tenders have been invited for the erection of telephone exchanges at Southall, Southampton and Folkestone.

Ilford Corporation is to establish new showrooms and offices for the electricity department at a cost of £52 000.

Chester City Council has referred back for further consideration a proposal to extend the municipal electricity showrooms.

A new edition of the London Telephone Directory is in preparation. New subscribers should give their orders before January 9th if they wish their names included in the new issue.

The Electrical Engineers' Dance will take place on January 31st at the Grand Hotel, Harrogate. Tickets £1 1s. each, inclusive of dinner, from Mr. H. Cecil Fraser, hon. sec., 36, Park Place, Leeds.

The first ordinary general meeting of the 1929–30 session of the Mersey and North Wales (Liverpool) Centre of the Institution of Electrical Engineers will take place on January 7th at the University, Brownlow Street, Sheffield. Mr. S. S. A. Watkins will lecture on "Talking Films."

Applications are invited for the position of borough electrical engineer of West Hartlepool.

The headquarters of the Electrical Trades Union will be transferred from Manchester to London in the near future.

At an informal function at the factory of the North British Aluminium Co., on Monday, electricity obtained from the Lochaber hydro-electric works was used for the first time in casting aluminium.

The National Institute for the Blind had at the time of going to press received £8,000 for the British "Wireless for the Blind" Fund, in response to the appeal broadcast by Mr. Winston Churchill on Christmas night.

The Oil Heating Institute (U.S.A.) has issued a warning to users of household appliances operated by electricity that it is advisable to learn the location of the fuses and how to change fuses. It is also suggested that electrical circuits should be checked when an automatic heater, electric refrigerator or other device is installed.

The Exchange Telegraph reports that a provisional contract for the exploitation of the Narva Falls has been granted by the Esthonian Ministry of Trade to the International Hydro-Electric Development Syndicate, Ltd., which has been formed in England. The Syndicate proposes to establish a 50 000 kW power station, at an estimated cost of 30 000 000 kroner.

Fulham (London) Electricity Committee recommends the Borough Council to engage a lady demonstrator and attendant at the electricity showrooms. The lady appointed is also to visit the homes of consumers to give instruction in the economical use of apparatus, and deal with minor difficulties. The Committee recommends that the appointment be temporary, and that the salary be from £4 to £5 per week.

Owing to the number of requests received for permission to visit the new Hams Hall station, the Birmingham Electric Supply Committee has decided to fix certain days in the spring and autumn during which ratepayers may visit the station.

Sir Andrew Duncan, chairman of the Central Electricity Board, opened the works of the Northern Chromium Co. at Newcastle-on-Tyne on December 18th. He said the company's process, which was new in that area, would consume a fair amount of electricity.

Dundee Corporation has accepted a tender amounting to £2 890 9s. for the supply of Belgian and Dutch cables. The lowest British tender was £3 422.

Mr. Norman Young delivered a lecture to the Paisley Association of Electrical Engineers on December 18th on "A New Electrical Method of Determining the Pressure in Engine Cylinders."

Chorley Education Committee has accepted the offers of the Lancashire Electric Power Co. to instal and maintain an electric cooker free of charge, on condition that instruction in its use is given to the students attending the cookery classes.

Mr. Wm. Keay, addressing the Sheffield Branch of the Association of Engineering and Shipbuilding Draughtsmen recently, said lights on lightships and lighthouses would be discernible through fog by television at no far distant time.

At the Borough Polytechnic Institute, London, S.E.1, a short simplified engineering course for women, arranged in conjunction with the Women's Engineering Society, will begin on January 7th. Fee for the course £1. Application forms from the Principal.

Mr. Wm. M'Farlane, of the Central Electricity Board, addressed the West of Scotland Iron and Steel Institute recently on the subject of "The Grid and Standardisation of Frequency."

Mr. R. Wilson, opening a discussion, at a meeting of the Midland Branch of the Association of Mining Electrical Engineers at Mansfield on December 22nd, said trailing cables were the most frequent cause of electrical accidents in mines. He thought that eventually a super "cab tyre" cable would be the most efficient means of preventing such accidents.

The Postmaster General announces special facilities until January 15th for New Year telegrams of greeting to the Continent of Europe at half the normal rates. Special facilities for the transmission of Christmas and New Year greeting telegrams through Rugby, Portishead, and other Post Office wireless stations to ships at sea are also announced.

A report by the National Electric Light Association of America states that the principal electrical developments of the year in the U.S.A. have been mainly in the improvement of steam-electric generation. Only 10% of the year's power house construction has been in hydro-electric plants, while, on the other hand, the concentration of production in large, high-pressure steam units has made remarkable progress.

The proposed extension to the Heriot-Watt College, Edinburgh, has been further discussed at a recent meeting of the governors. The extension will provide for the accommodation of the mechanical and electrical engineering, physics and other departments, and an examination hall capable of seating 750 people. The governors agreed to instruct the architect to proceed with the preparation of working drawings, and a committee was appointed to raise funds.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN, *dated January 3rd, 1880, reported the opening (on December 29th, 1879) of the cable to Cape Town via Zanzibar.*

Passengers by the Inman liner "City of Berlin" on her trip to New York "with the electric light on board" addressed a note of congratulation to the company.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of January 6th, 1905, reported the placing of an order by the Underground Electric Railways Co. of London for a large number of Maxim direct current traction circuit arc lamps.*

The Lyceum Theatre had just been opened after rebuilding, and a description of its electrical installation of about 2 000 lights was given.

Electrical methods for the fixation of nitrogen from the air were being tested.

* * *

FIFTEEN years ago, according to THE ELECTRICIAN *of January 1st, 1915, a Bill was promoted for the amalgamation of ten London electricity supply companies with a capital of £6 000 000.*

* * *

TEN years ago, THE ELECTRICIAN *of January 2nd, 1920, recorded an arrangement made by the Wolverhampton Corporation in connection with its housing scheme for the provision of electric lighting on the basis of a uniform charge of 1s. per week or thereabouts, to be collected with the rent and so obviate the use of meters.*

Digitized by Google

PERSONAL.

MR. Bernard C. Holding, who has edited THE ELECTRICIAN during the past three years, resigned at the end of last month to take up an appointment with the International Standard Electric Corporation, and has been succeeded in the editorship of this journal by Mr. G. H. Lepper.

Mr. Archibald Page, who has been awarded a knighthood.

The New Year Honours list contains few names of persons associated with the electrical industry. Amongst those upon whom the honour of knighthood has been conferred is Mr. Archibald Page, chief engineer and manager of the Central Electricity Board and a past-president of the Institution of Electrical Engineers; Mr. James Scott-Pitkeathly, is created a Companion of the Order of St. Michael and St. George, in recognition of his services as director of electrical undertakings in Ceylon; and Mr. Ernest Edward Rogers, examiner of technical accounts in the electrical engineering department of the Admiralty, is made a Member of the Order of the British Empire.

Sir A. V. Roe has joined the board of Runbaken Motor and Electrical Accessories, Ltd.

The appointment of Mr. J. H. Parker, as electrical engineer of the L.C.C. Tramways Dept., has been confirmed.

Capt. J. W. Barber, of the Brownie Wireless Co., Ltd., has been elected chairman of the R.M.A. in succession to Mr. J. T. Mould. The new vice-chairman is Mr. R. M. Ellis, of Climax Radio, Ltd.

Estate of the gross value of £128 418 with net personalty £119 146 was left by the late Mr. William Bannister, chairman of the Chloride Electrical Storage Co., Ltd., who died on October 1st, aged 81 years.

Mr. F. H. Bevan has been appointed manager of the joint branch of the London Electric Wire Co. and Smiths, Ltd., and the Liverpool Electric Cable Co., Ltd., at Leeds. Mr. Bevan was, until this appointment, outside representative of these companies at Manchester.

A battery-operated braking device for motor vehicles has been patented by Mr. H. M. Dudgeon and Mr. T. C. E. Rowland, engineers in the employ of Birmingham Corporation tramways department. The apparatus is said to be very effective and economical as regards the use of current.

With reference to the paragraph on page 834 of the December 27th issue of THE ELECTRICIAN, regarding the election of Mr. W. M. Selvey to full membership of the Institution of Electrical Engineers, this should have read Institution of Civil Engineers, Mr. Selvey having been a member of the I.E.E. since 1912.

Mr. T. W. Colson, owing to ill-health, has asked to be relieved of his duties, and he will, therefore, cease to be chief engineer and manager of the Surbiton electricity supply undertaking as from January 1st, but will be retained as advisory engineer. Mr. Edgar Stopford Saunders has been appointed his successor as from that date.

Mr. Robert Illingworth, who is leaving Cardiff to take up the position of deputy electrical engineer at Plymouth, was the recipient of personal gifts at three functions held in his honour during the week. The first was made by the workmen and officials of the power supply undertaking of Cory Brothers and Co., Cardiff, Ltd., in the form of a walnut full Westminster chime clock, suitably inscribed; the second gift was an all-mains radio-gramophone set, presented by the whole of the officials of the company; and the third was a silver cigarette cabinet, inscribed with the signatures of the donors, from his many friends at Cardiff.

Obituary.

LT.-COL. MONTAGU CRADOCK, aged 70 years. He had been a director of the Metropolitan-Vickers Electrical Co., Ltd., since 1902.

MR. WILLIAM HUBBARD, on December 16th, aged 49 years, for 15 years with Messrs. Burch and Vertue, electrical engineers and contractors, of 26, Union Street, Aldershot.

BUSINESS ITEMS.

MR. G. D. Witham, electrical engineer and contractor, has opened temporary business premises at 70, Elaine Street, Warrington.

The telephone numbers of INSULATORS, LTD., Derby Road Works, Montague Road, Edmonton, N.18, have been changed to Tottenham 4256/7.

The address of C. WILKINSON (LEEDS), LTD., Marshall's Mill, Holbeck, Leeds, has been changed to Marshall's Mill, Town End, Morley, near Leeds.

The D.P. BATTERY CO., LTD., has moved the Service Depot from Orchard Street, London, S.W.1, to 107A, Pimlico Road, S.W.1, where the charging of electric vehicles can now be undertaken.

MOFFATS, LTD., of Weston, Ontario, Canada, have recently shipped to the order of the Electricity Supply Board, Dublin, a consignment consisting of 133 electric ranges, 31 of which are of the cabinet type.

A fire which occurred on December 20th at a warehouse in Elder Yard, Saltergate, Chesterfield, destroyed a quantity of electrical equipment belonging to Mr. EDGAR R. MORRIS, electrical contractor, of Knifesmithgate.

The HART ACCUMULATOR CO., LTD., Marshgate Lane, Stratford, London, E.15, announces that "Hart" batteries are used in the world's fastest lifeboat, various references to which have recently appeared in the daily Press.

We are asked by the GENERAL ELECTRIC CO., LTD., to state that the fire which broke out in the Moulded Insulation Works, Witton, Birmingham, on the morning of December 30th was of quite a minor character, and will only involve a relatively small number of employees being out of work for a few days.

WE are informed that BROWETT, LINDLEY AND CO., LTD., Sandon Works, Patricroft, Manchester, who have been in the Receiver's hands on behalf of the debenture bond holders, are to be reconstructed early this year. The scheme of reconstruction is already well in hand and details will be made public shortly.

Mr. H. J. Brett, British Commercial Secretary at Shanghai will be available at the offices of the Overseas Trade Department, from January 16th to 24th. Firms desiring interviews or information regarding trade with China, should apply to the Comptroller-General, Department of Overseas Trade, 35, Old Queen Street, London S.W.1. (Reference 2203/1/29.)

Mr. H. O. Chalkley, Commercial Counsellor to the British Embassy at Buenos Aires, will be available at the offices of the Department of Overseas Trade, from January 13th to 17th, and from February 3rd to 7th. Firms desiring interviews, or information regarding trade with the Argentine, should apply to the Comptroller-General, Department of Overseas Trade, 35, Old Queen Street, London, S.W.1. (Reference 5534/1/29.)

METRO-VICK SUPPLIES, of Charing Cross Road, London, W.C., point out that perhaps the most notable example of the growing popularity of the "Harcourt" fittings is the recent installation at Chiltern Court, a large block of residential flats recently built over Baker Street (London) station, the whole of the fittings in all the public rooms, entrance hall, corridors, restaurant, etc., forming part of this contract. Other examples are fittings for the Plymouth Hippodrome; Bonington Theatre, Nottingham; Stock Exchange Restaurant, Manchester; the Sligo Cathedral, Ireland; and the whole of the decorative fittings for the Bristol Art Gallery.

One of the features of Radio Week, which this year will be held from January 12th to 18th, is a window display contest arranged by the MARCONIPHONE CO., LTD., of 210-212, Tottenham Court Road, London, W.1. The first, second and third prizes offered are £50, £20 and £10 respectively, while four prizes of £5 each are also offered. Special window display material, including pelmets, screens and showcards, has been prepared for free distribution among intending competitors, and the conditions of entry are (1) displays of "Marconiphone" lines illustrated in the current general catalogue—including receivers and loud speakers, valves, mains units, accumulators, batteries—only are eligible; (2) the display must be shown throughout the whole of Radio Week, January 12th to 18th; (3) a photograph of the display of a size not less than 5 in. by 4 in. and bearing the name and address of the competitor, must be sent to the organisers so as to reach them not later than January 21st. The photograph should also bear brief particulars of the display and approximate cost. Intending competitors may obtain entry forms from the company at the address given above.

INDUSTRIAL THERMAL STORAGE.

New Installation for Chromium Plating—Heating during "Off-peak" Hours—Time and Thermostat Switching—Labour Economy.

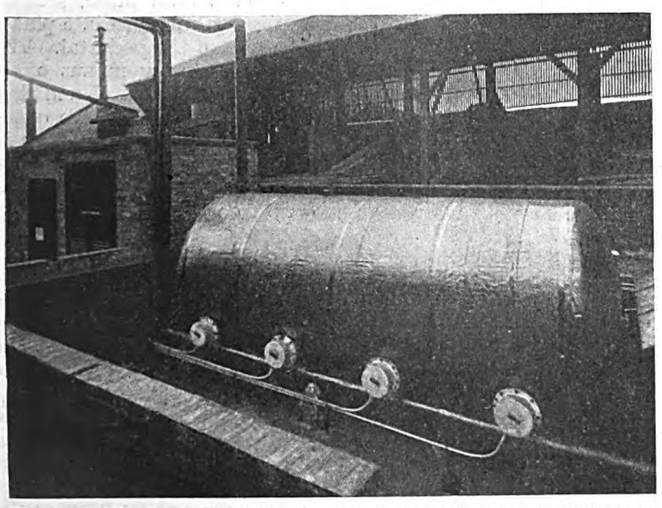
THE many advantages both to consumer and to supply authority of utilising electrical energy during off-peak-load periods are gradually being recognised throughout the country, and the demand for the cheap power obtainable during these periods is happily increasing. At the present time the field of application is somewhat restricted, and probably the largest demand is made by thermal storage systems. One of the first of these to be applied in Great Britain to industrial heating, if not actually the very first, is used in connection with the extensive plant recently installed by the Northern Chromium Co., Ltd., for chromium plating by a new process, for which they have the sole rights in Great Britain.

In all, there is a total of 24 large tanks, which have to be maintained at temperatures varying between 70 deg. F. and 140 deg. F. These tanks include chromium-plating tanks, hot-sawdust tanks, hot-water tanks, degreasing tanks and various acid baths used for copper, nickel and aluminium plating. Each tank is fitted with a heating coil made of steel or lead, depending on the nature of the electrolyte, and this coil is connected through valves on the inlet and outlet side to hot-water mains run round the building. One of these valves is a check valve, and is usually fully open, regulation being carried out on the other valve.

The whole system is efficiently lagged and the supply of hot water is taken from the large thermal storage cylinder installed in a pit outside the main building. This cylinder, which is 18 ft. long by 8 ft. diameter, holds 5 650 gallons of water, and is heated by immersion heaters of a total capacity of 120 kW, supplied by Messrs. A. Reyrolle and Co., Ltd., and arranged in four 30-kW banks. Each bank consists of nine 3·3-kW heating units mounted on a common flange-plate with their connections brought out to terminals on a set of four circular busbars. The supply is 3-phase at 440 V, 40 cycles, and three of the busbars are connected to the outers, while the fourth forms a star point. The heating units are so arranged that the load is equally divided between the three phases.

Energy for heating the cylinder is supplied at special rates, during the night hours only, from the mains of the Newcastle-upon-Tyne Electric Supply Co., Ltd. Current is automatically switched on by a time-switch at 7.30 p.m. and continues to flow until the water in the main cylinder reaches a temperature of 220 deg. F., when it is switched off by a thermostat.

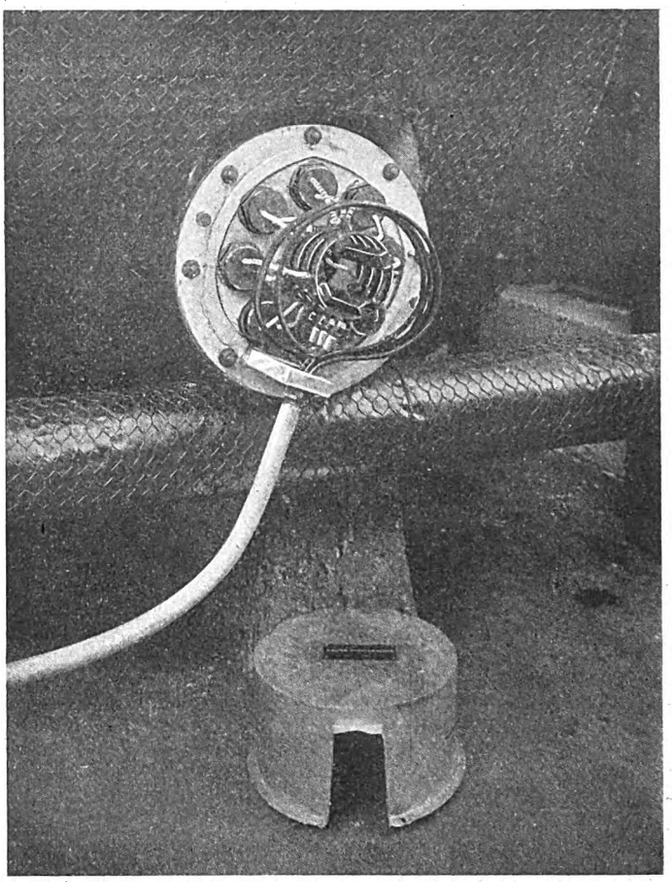
In the morning the main stop-valve is opened and a small circulating pump is started up, to pump hot water at a temperature of 220 deg. F. round the heating system, thus making



View of a 5 600 gallon storage tank showing projecting ends of four 30 kW banks of immersion heaters.

heat energy immediately available for heating up the various tanks required for the day's work. At the end of the day the water is at a temperature of 140 deg. F., which implies a total heat storage equivalent to 1 320 kW hours. It has been found that the majority of the tanks can be brought up to the required temperature within three-quarters of an hour after starting up the circulating pump.

The alternative to the above method of heating would have been the installation of a steam boiler, and each of the 24 tanks would have had to be fitted with a steam trap and, further, a connection to the steam trap would have had to be taken



One of the 30 kW banks with end cover removed to show the arrangement of busbars and method of connecting the single heater units.

through the bottom of the tank. This joint would always have been a possible source of leakage, allowing valuable electrolyte to escape to the floor of the plating room. Further, the replacement of a heating coil could only have been carried out by emptying the tank, whereas with the scheme of hot-water heating actually in use this can be done by merely breaking the joints and lifting the heating coil out of the tank.

It should also be remembered that the demand for heating is very heavy early in the morning, when the tanks are being brought up to temperature. It would, therefore, have been necessary to start firing the boiler a few hours before the beginning of the day's work, so as to reduce the danger of boiler-priming, and for the remainder of the day the boiler would have been working inefficiently on a very light load, to maintain the vats at their appropriate temperatures.

It will thus be seen that thermal storage heating has simplified the installation of the heating coils in the tanks and has also made the system much cleaner and easier to maintain. Labour has been reduced, because the operation of the thermal storage cylinder is entirely automatic, and the only labour involved is that of opening and closing the stop-valve and starting up or shutting down the circulating pump.

The equipment was installed by Messrs. R. W. Cairns, Newcastle-upon-Tyne, and the lagging of the pipe system and the thermal storage boiler was carried out by Newalls Insulation Co., Ltd.

Chromium plating is now extensively employed in the electrical industry, amongst its applications being switch-covers, plugs and sockets, lampholders, table lamps, irons, cooker apparatus, switchboard fittings, instrument cases, switch handles, relay cases, power station handrails and wireless parts. Its use is also extending in other branches of engineering.

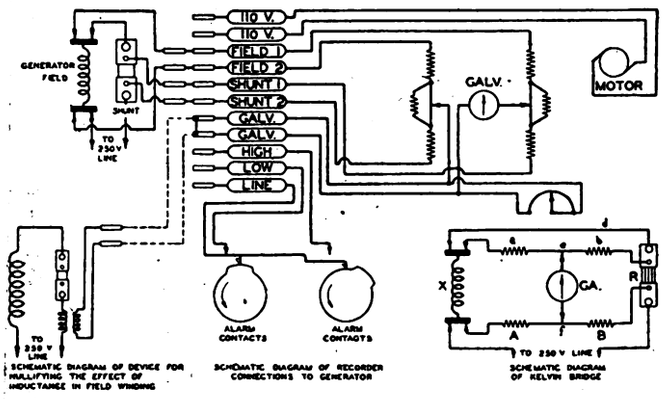
POWER EQUIPMENT.

A Vernier Regulator Switchgear Device — Maximum Demand Indicators — Direction Finding Apparatus—Dust Separator Fans.

ENGINEERS and others connected with the installation of switchgear may be interested in the "Duplex Vernier Type Regulator" recently introduced by the WALSALL ELECTRICAL CO., LTD., of 61, Bridge Street, Walsall. This regulator, whether mounted in front or at the back of the board, occupies no more space than the more ordinary type. In the standard model it is fitted with 30 contacts for coarse adjustments and 10 contacts on the vernier portion; the



The theoretical arrangement of the "L. and N." generator field temperature recorder.

radial switch arm is controlled by concentric hand wheels. The switch is of the laminated brush type, with liberal contact area. Together with the contact studs it is mounted on a "Sindanyo" ebony panel. The resistance units are stated to be of a special non-ferrous alloy, which is rustproof, has a negligible temperature coefficient and will not get brittle or perish under the influence of heat, exposure or age. The units are mounted on an insulating and heat-resisting compound, and are rated on a conservative basis. The standard design is suitable for currents up to 50 A. The manufacturers emphasise the convenience of the concentric hand wheels for manipulation when "paralleling," or controlling the alternator field.

The maximum demand indicator, type KM, of the A.E.G. ELECTRIC CO., LTD. (131, Victoria Street, London, S.W.1), is stated to constitute a new departure in this kind of indicator. It has a self-contained time switch and is claimed to compete strongly with the more usual type of meter equipped with a separate time switch, hand or electrically wound. We understand that although it comprises an electrically operated time switch combined with a maximum demand indicator, it costs less than an ordinary hand-wound time switch alone. The resetting, every 15, 30 or 60 minutes, is effected by a small shaded-pole motor, and the influence of voltage and frequency fluctuations on the time interval are said to be negligible. The indicator is advanced by a ratchet device working in conjunction with a relay which is actuated by two contacts fitted in the meter itself. These contacts make a break with the rotation of a toothed wheel of insulating material mounted on the register spindle.

The A.E.G. has also introduced a two-part tariff prepayment meter. It is not a creeping meter, and is stated to be the only instrument of its type which does not measure the "fixed charge" on the meter dial. Two elements are employed, the meter element proper for the energy consumption, and a Ferraris motor to take account of the fixed charge. The motor is constantly in circuit across the mains, and runs at a speed determined by the fixed charge, and shown on a graph which is supplied for the purpose. The drive of both elements is transmitted through a differential gear to the coin gear, which is thus returned to zero after an interval depending on consumption and fixed charge. The Ferraris motor, however, continues to operate, taking account of the sum necessary to cover the charge accruing between the opening of the switch and the next coin insertion. For example, if the consumer is absent for a fortnight, the correct amount for this period on the "fixed charge" basis is indicated in red on the coin dial, and must be paid—together with the coin, such as a shilling, which is due in advance—before the switch can revert to the closed position.

The coin mechanism is arranged with two sets of dials, the lower showing total coins inserted, up to 999, the upper indicating the amount paid in advance—in white figures on a black ground; the same dials show in red figures any amount up to 18 coins owing on the fixed charge basis, as explained above. The fixed charge apparatus is adjustable between the limits of 6d. and 4s. per week; the adjustment is effected by means of a stop watch and screw-driver, which alters the position of the screw above the Ferraris disc. The speeds corresponding to the above-mentioned values are 13 and 104 r.p.m., respectively; a wider range can be obtained by changing gears. The speed variation of the Ferraris motor with voltage and frequency changes is stated as approximately 1% for 10% in voltage and 1·2% for 1% in frequency.

An important feature of the new design of the direction finder equipment (type RA76) manufactured by the RADIO COMMUNICATION CO., LTD. (34-35, Norfolk Street, Strand, London, W.C.2) is the incorporation of complete automatic correction of quadrantal and pointer errors. The manufacturers explain that h.f. currents often induce in the metal structure of a ship, currents which give rise to a h.f. magnetic field. This induced magnetic field is superimposed on the magnetic field of the wave itself, consequently altering the apparent direction of the distant wireless station. The effect is analogous to the change in the apparent direction of the North Pole, as indicated by a simple magnetic compass when placed in a ship whose steel hull is magnetised by induction from the earth's field.

The errors introduced are quadrantal—reaching a maximum value at intervals of 90 deg. The amount of the error in the reading of a simple direction finder thus depends on how nearly the ship's electrical properties approach symmetry and on the position of the d.f. coils in relation to the ship's structure. In, therefore, a ship having perfect electrical symmetry the induced currents in the structure produce a magnetic field in the thwartship line, and the quadrantal error is zero in directions 0 deg., 90 deg., 180 deg., and 270 deg. from the bow; but in many instances the ship's field is to some extent misaligned, so that the quadrantal error is zero at four other angles from the bow. In order to correct the new direction finder for quadrantal error the following adjustments are therefore provided:—(*a*) Adjustment for magnitude of ship's field; (*b*) adjustment for alignment of ship's field; (*c*) adjustment for alignment of the pointer. This last is provided to correct the small error all round the scale which may be caused by a slight misalignment of the pointer with respect to the frame aerial. The device for the automatic correction consists of a gear wheel mounted on a base plate, secured to the rotating column and geared by an intermediate pinion to a toothed rim on the lower extension of the pedestal. The rotating gear wheel drives the scale plate by means of an eccentric pin working in a radial slot in this plate, and thus slightly advancing or retarding the scale in successive quadrants. The amount by which the driving pin is eccentric in relation to the axis of the gear wheel is indicated by a scale, and can be adjusted (at the time of installation and calibration) to correct quadrantal error up to a maximum of 20 deg.

Measuring Temperature Changes.

Power station engineers may be interested to learn some particulars of the system of measuring temperature changes in the field windings of alternators which is offered by the LEEDS AND NORTHRUP CO., of Philadelphia, for whom the INTEGRA CO., LTD. (183, Broad Street, Birmingham) act as agents. The L. and N. "Generator Field Temperature Recorder" is designed to give a continuous record of the temperature fluctuations. If, moreover, the generator is carrying a heavy load and the rotor overheats, the recorder will operate alarm signals when the temperature reaches the danger point. The recorder can also be used to ascertain the rate of cooling when the operator wishes to avoid risk of the insulation becoming strained through the windings being allowed to cool too rapidly. The apparatus operates on the principle of the resistance of a conductor varying with the temperature, the actual quantity measured being the resistance of the field winding. As this resistance amounts to only a few tenths of an ohm it can be measured more accurately with the Kelvin than with the Wheatstone bridge. Further-

Digitized by Google

more the fluctuating resistances of the brush contacts on the collector rings are made relatively unimportant in the Kelvin bridge circuit. The details of the circuit are shown in the accompanying diagram, in which the fundamental elements of the Kelvin bridge circuit are shown in the lower right-hand corner. X represents the resistance of the field winding, and R is a low-resistance shunt connected in series with it in the exciter circuit. Auxiliary brush contacts on the collector rings serve as potential points at the terminals of the field windings. These are connected to potential posts on the standard resistance through the fixed resistances A, B and a, b, with a slide-wire resistance between A and B and another between a and b. The terminals of the galvanometer leads are attached to movable contacts on these slide wires. A change in position of these contacts changes the ratio of A to B and of a to b, but at any setting $A=a$ and $B=b$. When the resistances are related as follows—

$$\frac{X}{R}=\frac{A}{B}=\frac{a}{b}$$

—the galvanometer pointer will not deflect from zero. The resistance R being constant, the ratio $X:R$ varies as X varies with the temperature; thus $A:B$ and $a:b$ must be varied accordingly, to reduce the deflection to zero. This is effected by changing the position of the slide wire contacts, the adjustment being made automatically by the recorder mechanism. Simultaneously with this action the recording mechanism draws a pen across a chart which is moved forward by the motor that actuates the instrument. The curve drawn by the pen shows the amount of adjustment of the ratio slide wires which is necessary to establish the required ratio, and it can thus be calibrated in temperature.

The connection denoted by d (in the small diagram on the right) represents the part of a Kelvin bridge circuit known as the yoke. Accuracy of measurement depends on the resistance of the yoke being kept low, and for this reason the standard resistance R is mounted as close to the generator as possible.

With self-induction in the field winding a change in field current may result in a momentary difference in potential at the galvanometer terminals, and this may cause a movement of the pen which does not correspond to temperature change. This effect can be avoided by connecting the galvanometer in series with the secondary of a current transformer, of which the primary is in series with the standard resistance and the field winding—as indicated at the lower left of the diagram. In this way a compensating e.m.f. is applied to the galvanometer in opposition to the e.m.f. induced in the field winding, so that load fluctuations do not affect the temperature record. This refinement is, however, only necessary when the recorder is connected to a generator supplying a fluctuating power load.

A New Engine.

The ENGLISH ELECTRIC CO., LTD., of Queen's House, Kingsway, London, W.C.2, have sent us particulars of their latest output of "Fullagar" oil engines. One of the special features of this type of engine consists in its having only one crank and connecting rod per cylinder, in place of the three cranks usual in other opposed-piston engines. The "Fullagar" is, indeed, a double-acting, two-stroke-cycle engine without cylinder covers, this design leading automatically to cylinders of small size for a given power, in spite of the low mean effective pressure and piston speed which have been adopted. The method by which the need for three cranks per cylinder is overcome is briefly as follows:—

In this explanation a single pair of cylinders is considered, A, B and C, D being respectively the upper and lower pistons in the first and second cylinders. The lower piston in the first cylinder, i.e., B, is connected to the upper piston in the second cylinder, i.e., C, and similarly A is connected to D by pairs of oblique rods external to the cylinders themselves. Combustion takes place between A and B and causes B to move downwards and A upwards. Piston A acts on the right-hand crank through the oblique rods, and also draws up D in the adjacent cylinder. Piston B acts directly on the left-hand crank, and also draws C downwards. The power required for compressing the air is thus obtained directly from the pistons in the adjoining cylinder, instead of being transmitted through the crankshaft. As the obliquity of the rods between the pistons is small, the lateral forces on the crosshead faces are claimed by manufacturers to be insignificant.

The top cross-heads are so designed and enclosed that they act as the displacers of the scavenge air pumps. The exhaust ports are uncovered slightly before the scavenge inlet ports, and when the latter open the scavenge air sweeps through the cylinder from end to end. Among the advantages claimed for the "Fullagar" construction are good balance, due to the centres of gravity of the adjacent reciprocating masses nearly coinciding; uniformity of torque, since each connecting rod is double acting and the effort of each crank is uniformly in one direction; and small load on main bearings.

Dust Separation.

The running parts of the Keith-Blackman patent dust separator fan are almost identical with those of the standard "Keith" induced draught fan. The manufacturers, however —JAMES KEITH AND BLACKMAN CO., LTD., of 27, Farringdon Avenue, London, E.C.4—ingeniously utilise a simple principle to make the fan incorporate the dust separating feature. A two-stage fan housing is adopted; the first stage has a conical vortex chamber in which the dust is thrown out centrifugally and diverted into the dust collector, while the cleaned gases pass to the second stage of the housing, in which a spiral diffuser converts into useful pressure the kinetic energy of the rotating stream of gases, providing also a suitable outlet into the chimney.

The actual cycle of changes which ensures separation of the dust is explained in more detail by the following:—The dust-laden flue gases are drawn through the circular inlet dust to the eye of the fan runner, at which point the flow is diverted by the runner from an axial to a radial direction. This change of direction is the first stage in the separation of the dust, as the particles tend to pass towards the back plate of the runner, along which they slide under the compulsion of the vanes. On reaching the periphery of the runner the dust is projected by centrifugal action on to the smooth slope of the deflecting cone, along which it is conducted until, assisted by a slight air current, it passes through a narrow annular space into the dust chamber.

IN PARLIAMENT.

Points from Replies to Recent Questions in the House of Commons.

IT is proposed to open the following automatic exchanges within the London telephone area during the next 12 months: Primrose Hill, Amherst (Hackney), Fairfield (Croydon), Addiscombe, Shepherd's Bush, Frobisher (Earl's Court), Gladstone (Cricklewood), Macaulay (Battersea Park), Livingstone (Norwood).

With regard to the proposal to construct a deep-level tube railway for fast traffic between Hammersmith or Earl's Court and the City, the Minister of Transport understands that, in the opinion of the railway companies concerned—with which he is disposed to agree—there are other improvements of tube railways likely to be needed before any such scheme as that to which reference had been made.

Attention having been called to agreements made or about to be entered into between the North Metropolitan Electric Supply Co. and certain local authorities whereby, in consideration of certain annual payments made by the company to the local authority, the local authority agrees not to exercise its right to purchase the electricity undertaking in its area, the Minister of Transport says such agreements do not have to be submitted for approval. He is not aware whether any further agreements of this kind are contemplated.

An automatic telephone exchange to serve the Bredbury district will be opened towards the end of 1931.

The Minister of Labour has no authority to interfere with the decision of Hull City Council to dismiss 130 tramwaymen who volunteered for service during the general strike.

The financial position does not at present permit of a reduction in Post Office telephone rental charges.

The technical officers of the Post Office are keeping the experimental transmissions of television under regular observation and are furnishing interim reports from time to time. The last such report was received at the beginning of December, 1929.

Approval of Electricity Orders.

The House of Commons has approved Electricity Supply Special Orders in respect of: (1) Knaresborough urban district and parts of Pateley Bridge and Great Ouseburn rural districts; (2) parts of Carmarthen rural district; and (3) Hayfield rural district and part of Glossop Dale rural district.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BIRMINGHAM GUARDIANS, January 4th–31st.—Electric lighting services, etc., in the extension of the nurses' home at Dudley Road Hospital. Specifications will be supplied on deposit of £3 3s. with The Treasurer, Union Offices, Edmund Street, Birmingham, on or before January 4th.

MANCHESTER CORPORATION, January 4th.—Supply of lead batteries for transport vehicles. Specifications from Mr. C.H. Lamb, Electricity Department, Town Hall, Manchester.

CENTRAL ELECTRICITY BOARD, January 6th.—Supply and erection of 132 kV overhead transmission lines (special crossings and high spans), in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.—P.L. 2) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit £2 2s.

WEST RIDING EDUCATION COMMITTEE, January 6th.—Electric lighting installation at Selby School of Art. Specifications, etc., from the Education Officer, County Hall, Wakefield.

WHARFEDALE RURAL DISTRICT COUNCIL, January 6th.—Electrician's work in connection with erection of 10 non-parlour houses, in three blocks, on housing site at Mill Lane, Pool. Bills of quantities, etc., from the Surveyor, Council Offices, Menston ; deposit £1 1s.

AYR COUNTY COUNCIL, January 8th.—Electrical work in connection with proposed new County Council Buildings, Ayr. Schedules, etc., from Mr. Alexander Mair, architect, 20, Wellington Square, Ayr ; deposit £2 2s.

LEEDS GUARDIANS, January 8th.—Electric lighting and bell installation at the vagrant wards, Holbeck Institution. Specification, etc., from Mr. J. H. Ford, Poor Law Offices, South Parade, Leeds. Stamped addressed envelope to be sent.

READING GUARDIANS, January 8th.—Electric lighting installation at new casual wards to be erected at Woodley, Berks. Energy will be taken from Thames Valley Electric Supply Co. Further particulars from Mr. J. Wayne-Morgan, 6, Church Road, Whitchurch, Cardiff ; deposit £2.

ISLINGTON (LONDON) GUARDIANS, January 9th.—Supply and erection of five full-automatic push-button electric lifts at the Infirmary, Highgate Hill, N.19. Specification, etc., from Mr. Albert King, Guardians' Offices, St. John's Road, Upper Holloway, N.19 ; deposit £2.

CAMBERWELL (LONDON) BOROUGH COUNCIL, January 13th.—Maintenance of electric lighting, heating and power installations, telephones, etc. (tender form H), and supply of electric lamps (form S). Forms of tender from the Borough Engineer.

DEWSBURY CORPORATION, January 13th.—Supply and erection of rotary convertor plant (1 500 kW and 500 kW). Specification, etc., from Mr. R. W. Grubb, borough electrical engineer, Bradford Road, Dewsbury.

STOKE AND WOLSTANTON GUARDIANS, January 13th.—Electric light and power wiring and fittings, in connection with new nurses' home, London Road Institution, Stoke-on-Trent. Specification, etc., from Mr. T. Wood, clerk to the Guardians, Union Offices, Stoke-on-Trent ; deposit £3.

DUNDEE CORPORATION, January 15th.—Supply of two 300 kVA outdoor type transformers and one 200 kVA outdoor type transformer. Specifications from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee.

BARMING HEATH MENTAL HOSPITAL, MAIDSTONE, January 16th.—Electrical installation, for lighting, heating, etc. Electrical energy will be supplied from the mains of Maidstone Corporation. Specification, etc., from Mr. E. E. Hoadley, Corporation Electricity Works, Maidstone ; deposit £2 2s.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 17th.—One year's supply of cables, electricity meters, cable terminal and other boxes, switches, wires, lamps and sundries. Specification, etc., from the Town Clerk, Municipal Buildings, Upper Street, London, N.1.

CENTRAL ELECTRICITY BOARD, January 20th.—Supply and erection of 3·3 kV, 6·6 kV, and 11 kV switchgear, for connecting the Board's supply to undertakers' busbars. Specification (N.W.E.—G.S.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit £2 2s.

METROPOLITAN WATER BOARD, January 21st.—Supply and erection of four steam turbines, with pumps, and two electric generators, for Surbiton pumping station. Specification, etc., from the Chief Engineer (Room 173), 173, Rosebery Avenue, London, E.C.1 ; deposit £3 3s.

BATH CORPORATION, January 22nd.—Supply of 60 000 lb. boiler, 7 000 kW turbo-alternator, and e.h.t., h.t. and l.t. cables required during 12 months. Specifications, etc., from Mr. J. W. Spark, city electrical engineer, 7, Dorchester Street, Bath ; deposit £2 2s.

GRIMSBY CORPORATION, January 23rd.—Manufacture, supply and erection of 10 000 kW three-phase turbo-alternator, with condensing plant. Specification, etc., from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby ; deposit £2 2s.

LIVERPOOL CORPORATION, January 23rd.—Twelve months' supply of materials to the electric supply department, including cables ,compounds and tapes (Form E.S.1), insulated cables (E.S.2), meters (E.S.3), incandescent lamps (E.S.5), a.c. motors and starting gear (E.S.7), electric cookers and kettles (E.S.11), etc. Tender forms from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

CENTRAL ELECTRICITY BOARD, February 1st.—Supply and erection of 33 000 V overhead transmission lines in South-East England. Specification (No. S.E.E.—S.L. 3) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

LOURENCO MARQUES TENDERING DEPARTMENT OF THE TREASURY, January 3rd.—Supply of oil-engine driven d.c. generator and battery. (Reference B.X. 5 961.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

JOHANNESBURG MUNICIPALITY, January 4th.—Supply of automatic traffic signals. (Reference B.X. 5 924.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 6th.—Supply and erection of plant for supply of filtered and unfiltered water, including pumps, electric motors, etc. (Reference A.X. 8 746.)

CAPE TOWN MUNICIPALITY, January 7th.—Supply of 3-core 11 000 V cable (specification No. 482/1929.) (Reference B.X. 5 925.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Telephone cable terminal boxes (schedule C. 540). (Reference B.X. 5 938.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C. 504). (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526). (Reference B.X. 5 823.)

BELGIAN POSTS AND TELEGRAPHS, January 8th.—Supply of 250 tons of bronze wire and five tons of annealed soft copper wire. Cahier des Charges Special, No. 3 455 (frs. 2½), from the Posts and Telegraphs Department, Salle Madeleine, Brussels.

PORT ELIZABETH MUNICIPALITY, January 9th.—Supply of electric cables, transformers and sundry electric materials (specification No. 35). (Reference B.X. 5 980.)

Digitized by Google

BLOEMFONTEIN MUNICIPALITY, January 10th.—Supply of automatic electric traffic signals (contract No. 5). (Reference B.X. 5 887.)

POSTMASTER-GENERAL'S DEPARTMENT, January 14th.—Supply of copper, bronze, tinned copper and cadmium copper jointing sleeves (schedule No. C.547). (Reference B.X. 5 997).

CAPE TOWN MUNICIPALITY, January 15th.—Supply of direct-coupled, electric motor driven, centrifugal pump for sewage works (specification No. 475/1 829.) (Reference A.X. 8 836.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943.) (Reference B.X. 5 879.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 21st.—Spare parts for automatic telephones. (Reference B.X. 5 917.)

SOUTH INDIAN RAILWAY CO., January 24th.—Supply of cables and accessories, in connection with Madras improvements. Specifications and forms of tender (£1, not returnable) from the Company's offices, 91, Petty France, Westminster, S.W.1.

NEW ZEALAND POSTS AND TELEGRAPHS, January 27th.—Supply of breastplate transmitters. (Reference B.X. 5 956.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates (schedule No. C. 533). (Reference B.X. 5 899.)

DUNEDIN DRAINAGE AND SEWERAGE BOARD, February 1st.—Supply of two centrifugal or propeller pumps, with electric motors and accessories (contract No. 737). (Reference A.X. 8 961.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct-coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

Telephone Materials for New Zealand.

NEW ZEALAND POSTS AND TELEGRAPHS, February 3rd.—Supply of protector blocks (carbon and porcelain). (Reference B.X. 5 948.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 5th.—Supply and delivery of indication alarm fuses. (Reference B.X. 5 947.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3.) (Reference B.X. 5 844.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T., 151/2 025). (Reference B.X. 5 955.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (schedule C. 541). (Reference B.X. 5 940.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Reference B.X. 5 941.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of switchboard plugs (schedule C. 548). (Reference B.X. 5 998.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of magneto and common battery telephones and automatic dials (schedule C. 544). (Reference B.X. 5 999.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457.) (Reference B.X. 5 793.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o the International Construction Co., Ltd., 56, Kingsway, London, W.C.2.

Tenders Accepted.

WREXHAM CORPORATION.—S. Thornton, electric light wiring of 160 houses, £1 100.

GREAT NORTHERN RAILWAY CO. (IRELAND).—British Thomson-Houston Co., Ltd., 12 months' supply of Mazda gasfilled electric lamps.

PUNJAB GOVERNMENT.—Callender's Cable and Construction Co., Ltd., h.t. overhead transmission lines for Uhl River hydro-electric undertaking, £659 585.

LIVERPOOL CORPORATION.—English Electric Co., Ltd., supply of twelve 750 kVA, three phase, 6 600/400 V, oil cooled, step down transformers for sub-stations, £279. (Recommended.)

GENERAL POST OFFICE.—Telephone exchange equipment, Altrincham, Standard Telephones and Cables, Ltd.; Guildford and Worthing, Ericsson Telephones, Ltd.; telephone repeater equipment, Birmingham, General Electric Co., Ltd.

LONDON COUNTY COUNCIL.—Electrical Installations, Ltd., electric light wiring and fittings and provision of power for lift at Stamford Hill Stores. Also tendered: Malcolm and Allen (London), Ltd., £470; Alex. Hawkins and Sons, £489; Pinching and Walton, £491; A. Dean and Co., Ltd., £509.

GLASGOW CORPORATION.—British Insulated Cables, Ltd., insulated bolts; Richard Johnson, Clapham and Morris, Ltd., wire; Titan Trackwork Co., Ltd., and Edgar Allen and Co., Ltd., points and crossings, tongues and switches; Hadfields, Ltd., tongues and switches; Dyer and Young, Ltd., armature coils.

LEEDS CORPORATION.—Supply of cables: Enfield Cable Works, Ltd., £11 130; Macintosh Cable Co., Ltd., £12 600; W. T. Henley's Telegraph Works Co., Ltd., £3 021; Hackbridge Cable Co., Ltd., £3 330; Croydon Cable Works, Ltd., £4 132; Derby Cables, Ltd., £1 147 9s. 2d.; and Edison Swan Cables, Ltd., £2 227 5s. 10d.

SOUTHEND CORPORATION.—English Electric Co., Ltd., two 59-seater, low-loading, trackless trolley vehicles, £4 760; J. Le Boutillier and Co., two cylinder heads for Diesel engines, £193 4s.; Chloride Electrical Storage Co., plates for renewal of 60 cells, Chalkwell Battery, £2 661 10s.; G. D. Peters and Co., Ltd., four sets transverse seats for tramcars, £669 4s. 6d.; Tilling-Stevens and Co., Ltd., tower wagon, £440.

DORKING ELECTRICITY SUPPLY.

Public Show Preference for Supply from the Central Board.

AT recent meetings of landowners and householders in the district around Dorking strong opposition has been shown to the Greater London and Counties Trust's Dorking Electricity Order, which has been made by the Electricity Commissioners and is awaiting confirmation by the Minister of Transport. At the inquiry which preceded the making of the Order (which covers about 50 square miles of country in Surrey), the London and Home Counties Electricity Authority opposed the granting of the Order to the Trust, on the ground that the district could be supplied more efficiently and at a cheaper price under a scheme in regard to which the Joint Authority would co-operate with the Central Electricity Board. It will be remembered that the Dorking undertaking was leased from 1909 to 1928 to the Dorking Electricity Supply Co., a subsidiary of Edmundson's Electricity Corporation, that the Council agreed that the company should promote an Order to carry on the undertaking for another 40 years, and that the Greater London and Counties Trust purchased practically the whole of the issued ordinary shares of Edmundson's Corporation on the understanding that the management and development of the Dorking undertaking should be entrusted to Edmundson's. The Joint Authority stated at the inquiry that it was prepared to take over the undertaking from the Council on terms at least as favourable as those agreed with the company. It is stated that a belief is held to a considerable extent in the district that electricity supplied under the companies' scheme is likely to cost more than if it is supplied under the national scheme, and the decision of the Ministry is awaited with some anxiety.

WORK IN PROSPECT.

ALTRINCHAM.—New Theatre for the Altrincham Garrick Society, to cost from £5 000 to £6 000. Particulars, Mr. T. Harold Hill, 19 Kingsway.

ANDOVER.—New premises for F. W. Woolworth and Co. Particulars, Mr. W. Priddle, Victory House, Kingsway, London, W.C.2.

BAMBRIDGE.—Conversion of workhouse into hospital, to cost £35 000. Particulars, Mr. Thos. Houston, architect, Belfast.

BARNET.—2 Operating theatres for the Guardians, to cost £3 500. Particulars, Clerk to the Guardians.

BARNSTEAD.—22 houses in Wilmott Way. Particulars, E. Best and Co.

BARROW-IN-FURNESS.—New wing and cottage at Barrow War Memorial Convalescent Home. Particulars, Mr. H. T. Fowler, architect, 6, Cornwallis Street.

BELFAST.—New Presbyterian Church, etc., at Stormont. Particulars, Mr. T. Houston, Wellington Place, Belfast.

BLACKBURN.—New cinema. Particulars, Messrs. Gray and Evans, architects, 51, North John Street, Liverpool.

BLACKLEY.—Café and cinema. Particulars, Mr. John Knight, 5, Cross Street, Manchester.

BROADSTAIRS.—New church. Particulars, Sir Giles Gilbert Scott, 7, Gray's Inn, Square, London, W.C.1.

BROMLEY.—New school at Bromley Common. Particulars, Mr. W. A. Forsyth, Stratford Place, London, W.1.

BROTHERTON.—Rebuilding of "Fox Inn" for Tower Brewery Co. Particulars, Messrs. Garside and Pennington, Ropergate, Pontefract.

CARLTON, NOTTS.—100 houses. Particulars, Mr. J. A. West, surveyor, Carlton.

CREWE.—45 houses. Particulars, Borough Architect.

DEVIZES.—New wing to Isolation Hospital. Particulars, Mr. T. Walker, architect, Trowbridge.

DONCASTER.—New premises for Co-operative Society. Particulars, T. H. Johnson and Son, architects, 20 Priory Place.

DORKING.—Three halls to seat 1 000, 400, and 150 respectively, with block of shops and offices. Particulars, Mr. P. W. Meredith, architect, 34, Old Queen Street, London, S.W.1.

DUMMERY.—New school, to cost £6 000. Particulars, Messrs. Ferguson and M'Ilveen, Belfast.

DUNDEE.—Nursery School, to cost £3 000 on the Blue Mountain site. Particulars, Mr. Charles Soutar, architect.

EAST HAM.—Factory. Particulars, Mr. T. Anders.

FRIERN BARNET.—33 houses. Particulars, Mr. G. Elphick.

KNUTSFORD.—Alterations and improvements at Mainwaring Arms Hotel, Higher Plaver. Particulars, A. Price and Son, Middlewich Road, Sandbach, Cheshire.

LEICESTER.—Extensions, etc., to Isolation Hospital, to cost about £4 455. Particulars, Messrs. Symington and Price, Market Street.

LONDON.—New buildings for Royal Institute of Public Health. Particulars, Mr. Josiah Gunton, of Messrs. Gunton, and Gunton, architects.

LUTON.—New bakery premises for Co-operative Society. Particulars, Architects' Department, 99, Leman Street, London, E.

MANCHESTER.—New factory at Trafford Park. Particulars Messrs. Halliday and Agate, architects, John Dalton Street, Manchester.

MARCH.—20 houses. Particulars, Messrs. J. Eggitt and Sons.

OLDHAM.—Alterations to main block at Poor Law Institution. Particulars, Messrs. C. T. Taylor Roberts and Bowman, 10, Clegg Street.

ROMFORD.—20 houses. Particulars, Messrs. Watts and Pierce.

ROTHERHAM.—New premises, for Messrs. Montagu Burton. Particulars, Mr. Harry Wilson, architect, 81, North Lane, Roundhay, Leeds.

RUNCORN.—50 houses in Grappenhall. Particulars, Mr. J. L. Beckett, surveyor.

SIDMOUTH.—New church at Woolbrook. Particulars, Mr. W. D. Caroe, 3, Great College Street, London, S.W.1.

SHEFFIELD.—Printing offices and works for Northcliffe Newspapers, Ltd. Particulars, Messrs. Herbert C. Ellis and Clarke, 3, Old Queen Street, S.W.1.

STRATFORD-ON-AVON.—Extension to grammar school. Particulars, Mr. A. C. Bunch, architect, 27, Binswood Avenue, Leamington Spa.

TRADE PUBLICATIONS.

AN illustrated catalogue dealing with switch and fuse gear has been compiled by the MIDLAND MANUFACTURING CO., LTD., Barford Street, Birmingham. The reference number of the new publication is 180, and the company has included information and tables of use to engineers.

The latest publication of CRYSELCO, LTD., Kempton Works, Bedford, is an attractively coloured showcard featuring the company's decorative lighting sets. The card is illustrated with a box of suitable lamps in various colours with a decorated background. The title of the card is "Use Cryselco Decorative Lamps and Eliminate Fire Risks."

A well-produced catalogue containing 108 large pages and dealing with the problem of correct artificial lighting, has been published by the BENJAMIN ELECTRIC, LTD., Brantford Works, Tariff Road, London, N.17. The number of the catalogue is 1100. Both commercial and industrial installations are covered, and numerous illustrations of both types of lighting are included.

BROWN BROTHERS, LTD., Great Eastern Street, London, E.C.2, have now entered the field of electrical suppliers. We have just received their latest catalogue, an illustrated list of nearly 200 pages. As with the other branches of their business, Brown Brothers, Ltd., have been very thorough in the ground they have covered, for the range of appliances, fittings and accessories listed is very comprehensive. Everything is arranged in alphabetical order; thus it is quite simple to refer to whatever is required without recourse to the index, although such is provided.

The latest publication of WATSON AND SONS (ELECTRO-MEDICAL), LTD., Sunic House, 43/47, Parker Street, Kingsway, London, W.C.2, is a catalogue dealing with high tension transformers for X-ray work. This booklet deals with the principles on which high-tension transformers operate, and describes fully such matters as methods of rectification, testing and rating. Further, it sets out the forms of rating prescribed in the British Standard Specification, and shows that "Watson" transformers are rated in accordance with these forms. The booklet also includes a detailed description, together with illustrations and prices, of the whole range of transformers manufactured by the firm.

CALENDARS FOR 1930.

THE number of calendars which we always receive at this time of the year indicates that manufacturers are not unmindful of the valuable publicity which these useful publications afford. So far we have received calendars from: The D.P. Battery Co., Ltd., Bakewell, Derbyshire; Thomas Ballin and Sons, Ltd., Widnes, Lancs; Robert Hornby and Co., Ltd., 77, Dean Street, London, W.1; B. S. and W. Whiteley, Ltd., Pool-in-Wharfdale; Mr. Christopher Wade, of Richard Wade Sons and Co., Ltd., 32, Linden Road, Bedford; the Sun Electrical Co., Ltd., 118-120 Charing Cross Road, London, W.C.2; C. A. Parsons and Co., Ltd., Newcastle-upon-Tyne; the North Metropolitan Power Co., Ltd.; Mr. W. H. Squire, 31, Sweyne Avenue, Southend; the Enfield Cable Works, Ltd., 296, High Holborn, London, W.C.1; George Nobbs, Ltd., 89, Cleveland Street, London, N.W.1; Brown, Boveri and Co., Ltd., Waterloo Place, London, S.W.1; Metro-Vick Supplies, Charing Cross Road, London, W.C.2; the Mullard Wireless Service Co., Ltd., Charing Cross Road, London, W.C.2; Vereeniging van Directeuren van Electriciteitsbedrijven in Nederland, 1, Nachtegaalspad, Arnhem; Crossley Brothers, Ltd., Openshaw, Manchester; the Dubilier Condenser Co., Ltd., Ducon Works, Victoria Road, London, W.3; the Britain Electric Motors Co., Earldown Works, Dermody Road, London, S.E.13; and the Revo Electric Co., Ltd., Great Queen Street, Kingsway, London, W.C.2.

1930 DIARIES, ETC.

We have received during the last few weeks pocket and other diaries from the following:—Mr. Charles Selz, 47–49, New Cavendish Street, London, W.1; the Enfield Cable Works, Ltd., Brimsdown, Middlesex; the Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester; the Westinghouse Electric International Co., New York; Francis Polden and Co., Ltd., 56, Cannon Street, London, E.C.; the Electrical Power Engineers' Association, 102, St. George's Square, London, S.W.1 (also novelty pencil). A diary has also been received from the A.C.E.C., 56, Victoria Street, London, S.W.1, and a novelty desk lighter from British Insulated Cables Ltd., Prescot, Lancs.

E.H.T. CONFERENCE.

Proceedings of Last Conference to be Published in Book Form.

SOME particulars have been received from M. Tribot-Laspière, the secretary of the Paris High-Tension Conference, 25 Boulevard Malesherbes, Paris, regarding the meeting that took place in June last, and the one which will take place in 1931.

It is a matter of congratulation that regarding the number of papers read at the last conference Great Britain took the second place with 17, coming after France with 27; being followed by the U.S.A. with 12, Switzerland 10, Italy 8 and Holland 8.

Political utterances three years ago made many people abroad think that our country was hopelessly out of date regarding electrical power matters; active participation in international conferences tend to advertise the country in question and neutralise such impressions.

The proceedings in three volumes in French, covering 2 400 pages, will be published shortly at 350 frs., paper covers, and 380 frs. bound. An English edition will be published at 58s. 6d. paper, and 63s. 6d. bound.

The proceedings form a well-printed mine of information, with a great deal of material regarding transmission lines, a subject of much interest at home at the present juncture.

A number of international committees are at work between conferences, including those dealing with insulating materials, transformer oils, oil switches, neutral earthing and line surges. The conference works in co-operation with the International Electrotechnical Commission.

Papers to be read at the next conference in June, 1931, should be forwarded as far as possible by the end of this year, and, therefore, within the next month or so, a number of engineers will start getting together notes to make the 1931 meeting as successful as was the last.

TYNESIDE ELECTRICITY.

Inquiry into Alleged Excessive Charges by Electricity Supply Companies.

AN inquiry was opened by Sir Harry Haward and Mr. W. W. Lackie, Electricity Commissioners, in Newcastle, on December 17th, in regard to demands by local authorities in surrounding districts for a reduction in the charges for electricity by the Newcastle-upon-Tyne Electric Supply Co., County of Durham Electrical Power Distribution Co., Northern Counties Electricity Supply Co., and Cleveland and Durham County Electric Power Co.

Mr. T. Rowland Harker, K.C., for the local authorities concerned, said the methods of charge adopted by the Newcastle company were methods not approved by the Ministry of Transport. In Newcastle the primary charge per unit was 5¾d. and in Hebburn 6d.

Sir George Lunn, giving evidence in support of the local authorities claims, said the worker in Jarrow paid 6d., while on the other side of the street, in South Shields, he paid 3½d.

Mr. Arthur Collins, adviser to the local authorities, said in 1921 it was the practice of all utility companies to put up their prices to meet the higher costs, but between January, 1921, and January, 1929, except for some minor alterations, the electricity charges of 1921 were maintained. The ratio of the companies' gross profits to capital outlay had risen from 4·9 in 1913 to 7·14 in 1928. Assuming that the present power prices stood, and after making provision for dividends, 3·269d. per kWh would, in his opinion, be a fair standard price for domestic lighting. A fair maximum price would be 4½d.

Mr. Robert Sloan, chairman and managing director of the Newcastle-upon-Tyne Electric Supply Co., maintained that the company's average price per unit was the lowest in the kingdom. Replying to Sir Harry Hawaid, Mr. Sloan said he thought the agricultural labourer was as well able to pay for electricity as a large number of consumers in the towns.

Mr. Harker argued that the real point to consider was that in practically every one of the typical cases which had been considered, the price was over 5d., and he considered it would be an unfortunate thing if the companies were to be left in a position to enable them to maintain such charges. The inquiry lasted four days.

As from Monday next the B.B.C. will transmit a daily Stock Exchange Report Service, via 5XX, at 9.15 p.m.

BRITISH INDUSTRIES FAIR.

Arrangements for Official Visits to the Electrical Section.

AS in previous years, arrangements have been made for a number of official visits to the electrical section of the British Industries Fair, which opens at Castle Bromwich, Birmingham, in February.

On February 20th, a luncheon will be attended by members of the Institution of Electrical Engineers, the Incorporated Municipal Electrical Association, the British Electrical Development Association, the Incorporated Association of Electric Power Companies, the Provincial Electric Supply Association, the Municipal Tramways and Transport Association, and the Tramways and Light Railways Association.

A luncheon to the Electrical Power Engineers' Association will be held on February 22nd, with a conference in the afternoon.

On February 27th, a luncheon will be attended by members of the South Midland Centre of the Institution of Electrical Engineers, the Association of Consulting Engineers, the Association of Supervising Electrical Engineers, the Electrical Contractors' Association, the Electrical Contractors' Association of Scotland, the Electrical Wholesalers' Federation, Ltd., the Electrical Merchants and Manufacturers' Association, the Association of Mining Electrical Engineers, and the Illuminating Engineering Society. A conference of members of the Electrical Contractors' Association and Electrical Wholesalers' Federation will be held in the morning.

Electrical Exhibitors.

We give below a preliminary list of electrical exhibitors at Birmingham :—

Alpha Electrical Apparatus Co.; H. E. Ashdown,(Birmingham),; Ltd.; Allday and Co., Ltd.; W. and T. Avery, Ltd.; A1 Electric Welding Appliances Co.; Allen-Liversidge, Ltd.; Belling and Co. Berkeley and Young, Ltd.; Berry's Electric (1928), Ltd.; S. O. Bowker; Bull Motors, Ltd.; British Electrical Repairs; Bulpitt and Sons, Ltd.; British Thomson-Houston Co., Ltd.; Bakelite, Ltd.; Birmingham Electric Furnaces, Ltd.; British Sangamo, Ltd.; British Aero-Technical Co., Ltd.; P. M. Braidwood; Birmingham Electric Supply Department; Birkbys, Ltd.; British Brass Fittings, Ltd.; British Electrical Development Association; British Electric Transformer Co., Ltd.; S. G. Brown, Ltd.; G. Bray and Co.; British Hanovia Quartz Lamp Co.; Brown's Dryers, Ltd.; British Resistor Co., Ltd.; British Furnaces, Ltd.; Cambridge Instrument Co.; Clear Hooters, Ltd.; Jones, Chesterton and Co., Ltd.; R. M. Catterson Smith; Credenda Conduits, Ltd.; Cellon (Richmond), Ltd.; W. Canning and Co.; Chloride Electrical Storage Co., Ltd.; L. G. Coade and Co.; Commutator Grinding Block Co., Ltd.; Curtis Manufacturing Co., Ltd.; Callender's Cable and Construction Co., Ltd.; Donovan and Co., Ltd.; De La Rue and Co., Ltd.; G. Dunhill; Drayton Regulators and Instrument Co., Ltd.; Electrical Power Engineers' Association; Electrical Power Engineering Co. (Birmingham), Ltd.; G. Ellison, Ltd.; Edison Swan Electric Co., Ltd.; Electric Furnaces, Ltd.; G. Elliott; Ellmar Moulding Co., Ltd.; Ever-Ready Co. (Great Britain), Ltd.; Eastern Telegraph Co., Ltd.; Film Cooling Towers (1925), Ltd.; Fielding and Platt, Ltd.; Falk Stadelmann and Co., Ltd., and Stoves, Ltd.; General Electric Co., Ltd.; Gent and Co., Ltd.; Harland Engineering Co.; John Harper, Ltd.; Hackbridge Electric Construction Co., Ltd.; H. Hope and Sons; Hewittic Electric Co., Ltd.; Highfield Electric Co., Ltd.; Horstmann Gear Co., Ltd.; Hailwood and Ackroyd, Ltd.; Holden and Hunt; W. C. Holmes and Co., Ltd.; Ingram and Kemp; India Rubber, Gutta Percha and Telegraph Works Co., Ltd.; Chas. Joyner and Co., Ltd.; Jackson Electric Stove Co., Ltd.; Langbridge, Ltd.; A. P. Lundberg and Sons, Ltd.; R. A. Lister and Co., Ltd.; Moffatts, Ltd.; H. Marsh and Co.; P. A. Mudd and Co.; Metropolitan-Vickers Electrical Co., Ltd.; McGeoch and Co., Ltd.; Micanite and Insulators, Ltd.; Midland Fan Co., Ltd.; Oldham and Son, Ltd.; F. Parks, Ltd.; C. H. Parsons, Ltd.; Pritchett and Gold and E.P.S. Co., Ltd.; Parker, Winder and Achurch, Ltd.; Parkinson Stove Co., Ltd.; W. and B. Parkinson and Cowan, Ltd.; Petters, Ltd.; Premier Electric Welding Co., Ltd.; Restlight, Ltd.; Rainsford and Lynes; Ray Engineering Co., Ltd.; Revo Electric Co., Ltd.; A. Reyrolle and Co., Ltd.; Rapid Magnetting Machine Co., Ltd.; Ringsdorf Carbons, Ltd.; Record Electric Co., Ltd.; Ransomes, Sims and Jefferies, Ltd.; Sperryn and Co., Ltd.; Stuart Turner, Ltd.; Shropshire, Worcestershire and Staffordshire Electric Power Co., Ltd.; Sturge and Baker, Ltd.; Streetly Manufacturing Co., Ltd.; G. and J. Swingler, Ltd.; Star Vacuum Cleaner Co., Ltd.; Maiden Ostick, Ltd.; Sturtevant Engineering Co., Ltd.; Sutherland Meter Co., Ltd.; Smalls, Ltd.; Turners Asbestos Cement, Ltd.; Telegraph Construction and Maintenance Co., Ltd.; Thermo Path Co., Ltd.; J. H. Tucker and Co., Ltd.; Taylor and Challen; Bertram Thomas; Vac-Tric, Ltd.; Vitalite, Ltd.; H. Wiggin and Co., Ltd.; Wardle Engineering Co., Ltd.; Wild, Barfield and Co., Ltd.; Wm. Whitehouse and Co., Ltd.; Young, Osmond and Young, Ltd.

ELECTRICITY SUPPLY.

Loans for Mains, Plant, etc.—Wokingham Objects to Overhead Lines—Bulk Supplies to Hampstead—New Power Station for Douglas—Expansion of Demand at Birmingham —No Contractors under Swansea Assisted Wiring Scheme.

WREXHAM T.C. has applied for a loan of £8 000 for mains and services.

Dover Electricity Committee seeks sanction to borrow a further £2 000 for mains.

The Electricity Commissioners have granted the East Grinstead Electricity (Extension) Special Order.

Walsall Electricity Committee is to extend mains in Camden Street and Dartmouth Avenue, at a cost of £600.

Hebden Bridge U.D.C. has applied for a loan of £3 000 for mains, services, and meters for a period of three years.

The Electricity Commissioners have sanctioned the borrowing of £78 000 by Battersea (London) B.C. for mains and services.

Bangor (Co. Down) B.C. received 90 applications up to December 3rd for supplies of electricity, and further applications were expected.

The Twickenham and Teddington Electric Supply Co. is to extend cables in Queen's Road and Burton's Road, Hampton Hill.

Warrington T.C. has applied for a loan of £1 716 for h.t. mains from Winwick to Croft, and the provision of a sub-station at the latter place.

Poplar (London) Electricity Committee seeks sanction to borrow £21 466 for services, £6 654 for meters, and £6 680 for wiring installations.

Preston Electricity Committee has decided that new consumers under the home tariff system must pay for a minimum consumption of 1 kWh per day, calculated over 12 months.

Hornsey Corporation has received sanction from the Electricity Commissioners to borrow £30 000 for mains and services.—The electricity department is to extend mains at a cost of £722.

The Irish Free State Ministry of Commerce has received a further application from the Antrim Electricity Supply Co. for consent to the placing of a h.t. line above ground to supply electricity at Randalstown.

The Brixham Gas Company is promoting a bill to authorise the company to extend the area in which it has the right to supply electricity, so as to include part of the urban district of Paignton at Broadsands.

Stoke Newington (London) Electricity Committee has received sanction to borrow £7 045 for mains and £8 235 for plant. The Committee is seeking sanction to borrow £5 000 for free wiring installations.

Burnley's gas and electrical engineers are submitting estimates for the improved lighting of the main road from Yorkshire Street to Belvedere Road and thence to Towneley tram terminus for an inclusive annual charge.

Shipley Electricity Committee has authorised the Engineer to arrange for the purchase of a 40 H.P. a.c. motor for hire to a consumer, and to lay 250 yards of cable, at an approximate cost of £230, in order to supply energy for driving the motor.

Uckfield R.D.C. is to ask the Ministry of Transport to rescind the powers of the Uckfield Gas and Electricity Co., with regard to the parishes of Buxted and Hadlow Down, in the event of the company not supplying electricity to the two villages within two months.

Bury St. Edmunds T.C. has decided, in order to provide labour for the unemployed, to carry out work in connection with the change over of a section of the area from d.c. to a.c., at a cost of £4 340, including switchboard, 100 kW rotary convertor, and 800 yds. of service cable.

Wokingham R.D.C. is recommended by the Town Planning Committee not to withdraw its opposition to the overhead lines proposed to be put up at Woodley, Berks, by the Thames Valley Electric Supply Co., Ltd., in spite of the Electricity Commissioners' request for such withdrawal.

The Irish Free State Electricity Supply Board has refused to lay underground cables in the streets of Carlow at present served by such cables, as requested by the U.D.C., on the ground that it is not an economic proposition. It has been decided to call a public meeting of protest.

Marylebone Electric Supply Committee recommends that subject to the sanction of the Electricity Commissioners, expenditure of the estimated sum of £34 915, in respect of cables and switchgear, be approved in connection with future bulk supplies to the Hampstead Borough Council.

Derby Electricity Committee recommends application to the Electricity Commissioners for sanction to borrow £77 398 to cover capital expenditure in 1928 and 1929. The committee also proposes to apply to the Unemployment Grants Committee for grants towards £24 100 to be spent upon electricity extensions.

Peterborough T.C. has applied for loans amounting to £26 000 for electricity purposes, made up of £4 000 for supply and distributing mains to give a supply to Stanground; £10 000 for replacements of old mains; £5 000 for changing over from d.c. to a.c.; and £7 000 for additions to coal-handling plant.

Barking U.D.C. has agreed with London County Council to give a supply of electricity to 1 414 houses proposed to be erected on the Barking section of the Becontree estate on terms previously agreed for another section of the estate. The Electricity Committee recommends that 2d. per kWh be charged for prepayment meter supplies.

The new power station at Pulrose, established by the Douglas (Isle of Man) T.C., was opened on December 20th by Alderman R. Corlett, J.P., chairman of the Electricity Committee. Alderman Corlett announced that the cost of the station, sub-stations, and new plant for the old station was approximately £75 000.

During November an additional 1 200 premises were connected to Birmingham Corporation's mains, involving an extra 12 000 lamps in the lighting section, and 1 500 H.P. in the power section. The total capacity of the motors now installed on consumers' premises and supplied from the Corporation's mains exceeds 330 000 H.P.

Morecambe Electricity Committee has instructed the electrical engineer to prepare a scheme for extending the electricity mains to an area situate off Lancaster Road, embracing Croft Street, Dudley Street, Buxton Street, Maylands Square and Hope Street. The scheme is to be submitted to the Unemployment Grants Committee for approval for grant in aid of the works.

Hammersmith (London) electricity department is to give an additional supply to the Duramin Engineering Co., Ltd., at Hythe Road, amounting to 25 H.P., for which a h.t. main is to be laid from the Hythe Road sub-station to a new sub-station on the company's premises. The department is to carry out mains extensions in Bradmore Grove and Chancellor's and Wellington Roads, at an estimated expenditure of £486.

Ilford Electricity Committee has authorised the Borough Electrical Engineer to report in reference to the provision of electric mains in connection with the Loxford Estate development. The Committee has received sanction to borrow £50 000 for mains and services, and is seeking sanction to borrow £9 700 in respect of sub-station plant.

Swansea Electricity Committee has arranged terms for a supply of electricity to the Mannesmann Tube Co., Ltd., which is to instal further electrical plant.—The Borough Electrical Engineer has reported to the Electricity Committee that installation contractors in the borough have requested permission to carry out the installations under the assisted wiring scheme, but the Committee has decided that for the time being the work be carried out by the electricity department.

Bexhill Electricity Committee is to construct a sub-station near Mount Idol Farm at a cost of £2 757; extend cables from Broadoak Lane at a cost of £1 635; provide a l.t. feeder from the proposed sub-station to a feeder pillar, £1 471, and provide distributor cable from the proposed sub-station to the junction of Watermill Lane, £353.—On the half year's working of the electricity department ended September 30th last there was a loss of £4 426, compared with a loss of £2 345 for the corresponding period last year.

Worcestershire County Highways Committee has received notices from the Central Electricity Board asking consent to the placing of overhead 132 000 V cables in several parts of the county, for the purpose of the Central England electricity scheme, and enquiring whether the Council desires to be heard by the Minister of Transport in connection with these applications. The committee has informed the board that it is unable to advise the Council to consent to the erection of the overhead cables referred to in the county.

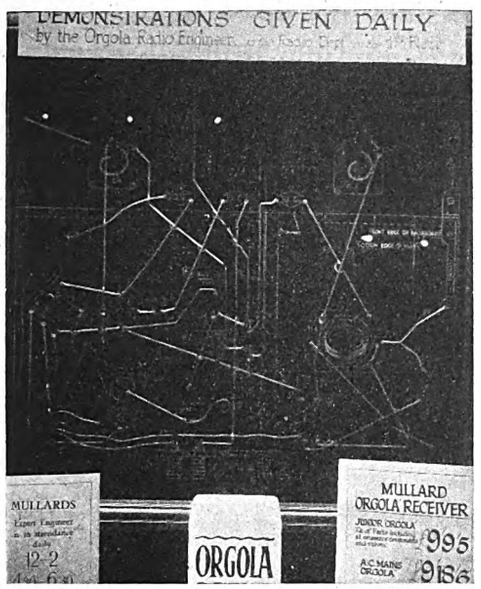
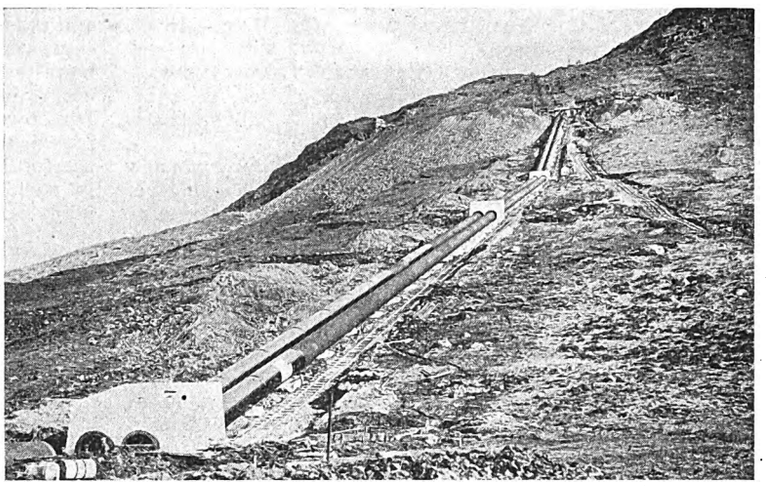
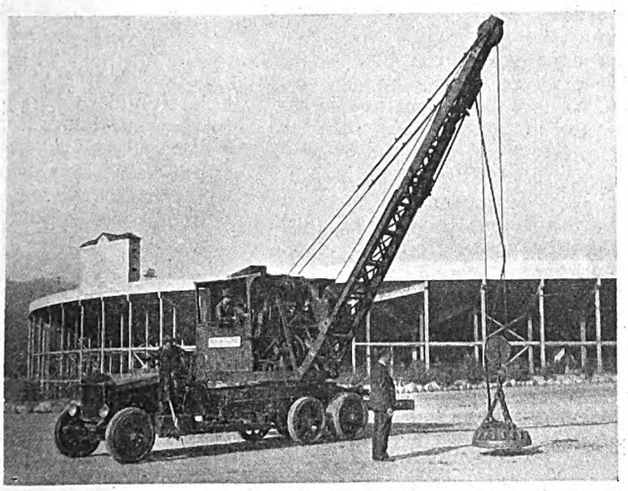
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



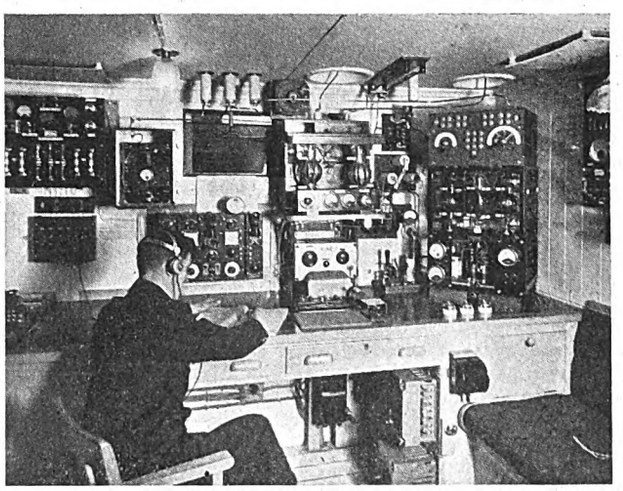
A novel window display seen at a London store. The wiring diagram represents the back-of-panel arrangement of the Mullard "Orgola" receiver, and the connections are made with glass tubes, filled with different coloured liquids to indicate the various circuits.



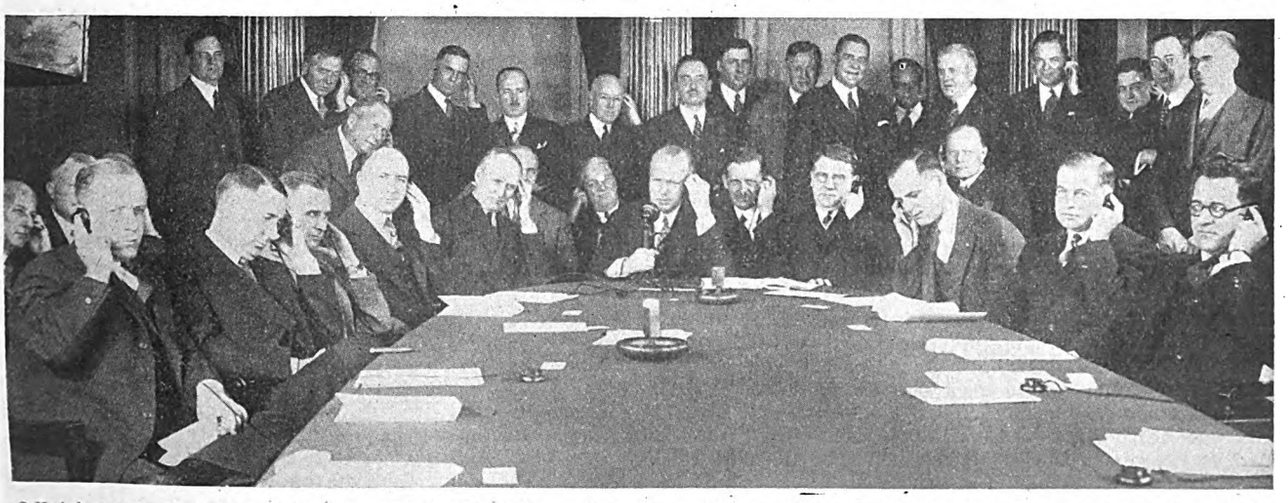
The 16-mile tunnel bored through Ben Nevis in connection with the Grampian electricity scheme is nearing completion, and orders will soon be given to blast the last few tons of rock, which will release the waters of Loch Treig through the tunnel to Inverlochy, near Fort William. This picture of the Fort Wlliiam end of the works shows the junction of the tunnel and the pipe lines leading to the power station.



In order to eliminate traffic difficulties due to burst tyres when the Rose Bowl at Pasadena, Cal., is emptied of its thousands of motor-cars following the annual East *v.* West football match on New Year's Day, the city authorities clear the ground of nails, etc., by means of a large portable electro-magnet.



Marconi equipment on the "Discovery II," the Royal research ship now proceeding to the Antarctic for three years. The apparatus will enable the vessel to keep in direct communication with this country throughout the whole period of the expedition, both medium and short wave transmitters being provided.



Officials of the American Telephone and Telegraph Co. and the United States Shipping Line in the offices of the A. T. and T. at New York on the occasion of the inauguration of the ship-shore public telephone service in America. This picture, which is among the first to reach this country, shows Mr. Walter S. Gifford, President of the A. T. and T. in the centre at the head of the table, holding conversation with the Commander of the s.s. "Leviathan" in mid-Atlantic.

COMPANY NEWS.

Perak Hydro-Electric Project—American Power Merger—Adjournment of Baird Television Meeting—Allen West and Co's Increased Continental Trade.

ELECTRIC AND GENERAL INVESTMENT CO., LTD.—Intm. div. of 5% is announced.

YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS CO., LTD.—Fin. div. in respect of half-year ended Dec. 31, 1929, on 6% cum. pref. shs. of 3% (at rate of 6% p.a.) has been declared.

SYDSVENSKA KRAFTAKTIEBOLAGET.—At this company's new Karseforsen hydro-electric power station on the Lagen river a 16 500 kW set has been started, and another unit of the same capacity will soon be completed.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—Divs. of 3% on pref., plus further 3% participatn. (same as last year), and 3% on ord. (same), will be payable on Jan. 15. Earngs. for qrtr. ended Sept. 30, before provisn. for taxatn., £318 468, agst. £298 169.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—Div. on 7% cum. participatg. pref. shs. for year ended Dec. 31, 1929, at rate of 7%, being 1s. 4·8d. p. sh., less tax (coupon 38), is payable at the head office of the company, Marconi House, Strand, London, W.C.2. Coupons to be left four clear days.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—A mtg. will be held on Jan. 10 to consider a resolution to alter the articles of association so as to comply with the new Companies Act, and to secure that the control of the company shall remain in the hands of British subjects, by restricting the holdings of foreign shareholders to 20% of the whole sh. cap.

WEST INDIA AND PANAMA TELEGRAPH CO., LTD.—Mtg. to consider revisn. of articles of association will be held on Jan. 20. Proposed amendmts. are intended to secure that only British subjects can be appointed directors of the company, except any director who is on the Board of Cables and Wireless, and that not more than 25% (nom. value) of the issued amt. of any class of shs. shall at any one time be under foreign control.

PERAK RIVER HYDRO-ELECTRIC POWER CO., LTD.—Rpt. to July 31, 1929, states that steam statn. has been in operatn. since Dec. 12, 1928, and has given satisfactory and increasg. supply of power. Erection of 6,000 kW extensn. of steam statn. (makg. 18 000 kW installed) has bn. completed, and plant in now in operatn. In constructn. of hydro-electric statn. good progress has been made, and final sectn. of dam is now under constructn.

AGRICULTURAL AND GENERAL ENGINEERS, LTD.—Receipts for year ended March 31, £53 495, includg. £33 902 from subsidiaries. Eleven companies made pfts. aggregatg. £235 596, while two made losses amtg. to £19 838. Tradg. of the group shows pft. £215 758, agst. £148 379. Deductg. maintenance, depreciatn., taxatn., int., etc., leaves £33 968, agst. £53 945. Combined accts. of parent company and subsidiaries show surplus of assets over liabilities, £2 477 492.

AMERICAN POWER MERGER.—It is reported from New York that it is proposed to transfer the present assets of the Standard Power and Light Corporation (which include over 94% of the common stk. of the Philadelphia Co.) to the Standard Gas and Electric Co. The Standard Power and Light Co. will acquire a majority of the common stk. of the Standard Gas and Electric Co., which will be the sole votg. stk. of that company. The Standard Gas and Electric Co. is one of the largest public utility undertakings in the United States, serving a total of 1 554 communities.

COMPAÑIA HISPANO-AMERICANA DE ELECTRICIDAD S.A.—Coupon B 10 of the income bonds issued by the company is to be paid in advance. As from Jan. 2, 1930, these coupons are payable as follows: Coupon of bonds which have been converted into Argentine paper pesos will be paid at rate of 6·75 paper pesos p. coupon or equivalent at sight rate on Buenos Aires ruling on day on which paymt. is effected, and coupon of bonds which have not been converted into Argentine paper pesos will be paid at rate of Ptas. 15 p. coupon, or, in foreign countries, equivalent, at sight rate on Madrid ruling on day on which paymt. is effected.

BRITISH RADIOSTAT CORPORATION, LTD.—A statement, issued to comply with the requirements of the Stock Exchange, contains the following information: Company was incorporated in Canada on Oct. 24, 1929, to acquire plant, patents, etc., of "Stenode Radiostat" Inventions, and to carry on business of wireless, electrical, cable, communication and allied concerns; authorised cap., 1 000 000 shs., and issued and paid up, 953 000 shs. of no par value. The directors are empowered to borrow money and obtain advances from any bank or banks, etc., at such times and in such sums as they may think necessary, with the consent of six of the directors. Directors' remuneratn. is to be $2 400 p.a., divided so that the president receives two shs. and each other director one sh. of the total, plus 5% of the net pfts., divided amongst directors in such manner as they may determine. Particulars are given of contracts which have been entered into.

Company Meetings.

BAIRD TELEVISION DEVELOPMENT CO., LTD.—At the recent general meeting it was decided to adjourn the meeting until a date in February, to avoid any possibility of prejudicing pending negotiations for the amalgamation of Baird International Television and the Baird Television Development Co. Notice will be sent in due course to shareholders announcing the date of the adjourned meeting.

CEARA TRAMWAY, LIGHT AND POWER CO., LTD.—Mr. E. H. R. Trenow, presiding at the meeting on December 23rd, said the net operating receipts for the year ended June last were 33 012 milreis in excess of those of the previous year, in spite of motor omnibus competition. To meet this competition the company had acquired and put into operation 14 motor omnibuses, which were running as a counter to those opposing the tramways. Though the tramway receipts had suffered from the cause mentioned, the falling off had been more than offset by economies in operation and by the increase in earnings of the power supply section of the company. It had been decided to instal a complete new turbo-generating unit, and they were hoping to be able to add this to their assets without making an addition to their capital. During the last five years they had spent over £86 000 on capital account without any increase in capital liabilities. During that period they not only did not increase their capital, but cancelled £50 000 of debenture debt. The report was adopted, and a dividend of 5% on the ordinary shares was approved.

ALLEN WEST AND CO., LTD.—Mr. A. E. L. Slazenger, presiding at the recent annual meeting, said since the date of their last balance sheet they had become a public company and increased their capital to £500 000 by the issue of 200 000 7% participating preference shares and by the distribution of £130 333 out of the capital reserve of £157 982 to the ordinary shareholders by the allotment of 130 333 ordinary shares of £1 each. £27 443 ordinary shares were issued for the purpose of acquiring the whole of the ordinary and deferred shares in Electric Control, Ltd., and 500 ordinary £1 shares issued for cash at £2 per share. The net profits amounted to £29 291, as compared with £24 224 in the previous year. The amount invested in subsidiary companies had been increased from £30 493 to £61 157, due to the continued growth of the business secured by these companies, and, in view of their successful operation, it was the intention of the directors to carry out a similar policy in other overseas markets. Orders in hand were two-and-a-half times as large as at the date of the last balance sheet, notwithstanding the largely increased output which had been obtained. This increase was mainly in export business, where, contrary to the experience of the large electrical companies, better prices had been obtainable than in the home market. During the year the whole output of the company's new products had been sold on the Continent, as, owing to the rapid increase of the Continental demand, it had been impossible to allot any output to the home market. In view of this, the directors had bought the Government factory at Woolston and 83 acres of freehold land. With the removal of the heavier products to Woolston, the output of lighter repetition work could be accelerated in the present factories to cope with the increasing demand. They looked forward to the future with the greatest confidence, in view of the increasing recognition of the quality of the company's products by important users both at home and overseas. The report was adopted and the following dividends were approved: 8% on ordinary shares for 12 months ended July 31st, 1929, and a further dividend at the rate of ⅛% per annum for six days on the preference shares, to be paid at the same time as the first half year's preference dividend.

PETERSFIELD ELECTRIC LIGHT AND POWER CO., LTD.—Satisfactions registered December 17th, £5 000 (not ex.) registered August 14th, 1924, and all moneys, etc., registered August 15th, 1925.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

SMITH (B.) and EVANS (B. I.), trading as RADIDYS, wireless retailers, 841, Fulham Road, London, S.W.6. A meeting of the creditors of the above was held on December 23rd at the offices of Percy Phillips and Co., certified accountants, 132, Great Portland Street, W.1, when a statement of affairs was presented which showed liabilities of £427. Of that amount £412 was due to the trade and £15 to creditors for expenses. The assets (including book debts £7, and stock at cost £207, valued at £100) totalled £133, less £16 preferential claims, or a deficiency of £310. It appeared that the debtors commenced business in July last, the debtor Evans putting in £350 cash and £50 worth of goods. The debtor Smith brought a motor-car into the business, on which he had paid £100 under a hire purchase agreement, and stock amounting to £216. Against that he had trade creditors and a bank overdraft amounting to £266, which the partnership concern took over. His net capital was therefore £50, and the total partnership capital was £450. The deficiency was accounted for by depreciation of stock £107, of fixture and fittings £105, of motor-car £152, loss on trading £236, and salaries of the debtors £8 a week. The debtors stated that the present position was due to the fact that the shop was not situated in the right quarter and the trade had been very bad indeed. The takings had never been more than £20 a week. One of the debtors said that they had tried to keep up the prices of their stock, but they were handicapped owing to the fact that there were several wireless shops in the vicinity where the prices were cut, and in some cases goods were sold by the competing firms at less than the debtors could purchase.

An offer was made of 4s. in the £, in cash, but the creditors considered that the offer should be increased to one of 5s. in the £, in cash, payable within seven days. Mr. Durs, representing Brahams, Ltd., who were creditors for over £200, said that he had no instructions to bind his clients in any composition arrangement, but he would report the result of the meeting to them and let the accountant know the course they wished to take in the matter. The following are creditors: Brahams, Ltd., £205; Sacks, Alfred, £103; Oldhams, Ltd., £36; Callenders Cable Co., £28; Formo, Ltd., £16.

London Gazette, etc.

Company Winding-up.

IDEAL WIRELESS CO., LTD., Dorland House, 14, Regent Street, S.W.1. Meetings of creditors, January 9th, 11.30 a.m., and contributories, 12 noon, 33, Carey Street, Lincoln's Inn, London, W.C.2.

Company Winding-up Voluntarily.

BUILTH WELLS ELECTRIC SUPPLY CO., LTD. By special resolution December 20th. H. Ashton, Victoria Hall, Llandrindod Wells, corporate accountant, appointed as liquidator.

Notice of Intended Dividend.

TATTERSALL, John Harold Barlow, 456, Burnley Road, Scout Bottom, Waterfoot, Lancashire, trading as H. TATTERSALL. plumber and electrician. Last day for receiving proofs, January 8th. Trustee, J. D. Turner, Byrom Street, Manchester, Official Receiver,

Order Made on Application for Discharge.

HURLES, Edward James Gordon, 8, Blackfriars Road, London, S.E.1, wireless dealer. Discharge suspended for two years until November 29th 1931.

Partnership Dissolved.

STUBBINGS AND ROE (John William STUBBINGS and Arthur Eric ROE), motor, electrical and general engineers, 160, London Road, Nottingham, as from September 30th, 1929. Debts received and paid by A. E. Roe, who will continue the business under the style of The London Road Garage, Nottingham.

COMING EVENTS.

Friday, January 3rd.

Institution of Mechanical Engineers.—Storey's Gate, Westminster, London, S.W. Thomas Lowe Gray lecture by Eng. Vice-Admiral Skelton on "Progress in Marine Engineering." 6 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London. Paper by Messrs. J. G. Wellings and C. G. Mayo on "Instrument Transformers." 7 *p.m.*

Monday, January 6th.

Institution of Electrical Engineers (Mersey and North Wales-Liverpool-Centre.)—University, Brownlow Street, Liverpool. Lecture by Mr. S. S. A. Watkins on "Talking Films." 7 *p.m.*

Tuesday, January 7th.

Electrical Association for Women (Bristol and District Branch).—Electricity Showrooms, Colston Avenue. Cookery Demonstration by Miss G. Edbrooke. 3 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. Paper by Miss C. Haslett on "The Place of Women in the Electrical Industry." 7.15 *p.m.*

Electrical Society of Glasgow.—30, Gordon Street. Paper by Mr. T. Ingram Craig on "The Electric House." 7.30 *p.m.*

Television Society.—Engineers' Club, Coventry Street, Piccadilly Circus, London. Lecture by Mr. W. S. Newton on "Photographic Problems of Picture Telegraphy." 8 *p.m.*

Tuesday, January 7th—Thursday, January 9th.

Physical and Optical Societies.—Imperial College of Science and Technology, South Kensington. Twentieth annual exhibition of electrical. optical and other physical apparatus.

Wednesday, January 8th.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting 5.30 *p.m.*

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.

Institution of Railway Signal Engineers.—Institution of Electrical Engineers, Victoria Embankment, London. Paper by Mr. H. H. Dyer on "Some Further Electrical Details of the Bow Road—Barking Signalling." 6 *p.m.*

Institute of Fuel.—Chemical Society, Burlington House, Piccadilly, London. Paper by Mr. O. Kubalek on "Fuel Economisers, with Special Reference to Their Construction, Materials and Recent Developments." 6 *p.m.*

Thursday, January 9th.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting. 3.30 *p.m.*

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Paper by Messrs. T. W. Ross and H. G. Bell on "Recent Developments in the protection of Three-Phase Transmission Lines and Feeders." 6 *p.m.*

Institution of Electrical Engineers (Dundee Sub-Centre).—University College. Paper by A. F. Stevenson on "Cable Design." 7.30 *p.m.*

Friday, January 10th.

Institution of Electrical Engineers (North-Western Centre).—Free Trade Hall, Manchester. Faraday Lecture by Captain P. P. Eckersley on "Broadcasting by Electric Waves." 7.30 *p.m.*

Junior Institution of Engineers.—30, Victoria Street, Westminster, London, S.W. Paper by Mr. H. J. N. Riddle on "The Track Circuit in Railway Signalling." 7.30 *p.m.*

Saturday, January 11th.

Association of Mining Electrical Engineers (South Wales Branch).—Paper by Mr. S. T. Richards on "Electricity in Mines—First Aid."

AERASPRAY GUNS

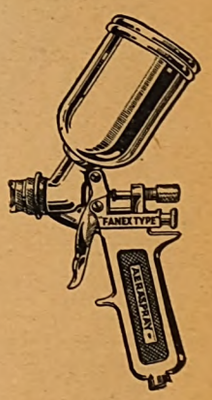
Have such important advantages and unique features that many firms are *re-equipping* their finishing shops with them.

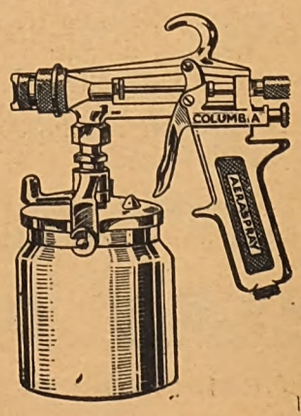
They will save up to 40% of material, and 50% of air.

Made of Duralumin with threadless nozzles and needles — of stainless or hardened steel according to duty—they are the lightest guns made; they also have the lightest trigger action.

There are no other guns quite so speedy and few comparable.

Gladly sent on 7 Days Trial.





SPECIALITIES

Air Compressors fitted with forced lubrication on all sizes.

Roller and Ball-bearing Fans of all types.

Self-scavenging Purifiers.

Spraying Cabinets, etc.

Portable Painting Plants.

10 Years Guarantee.

AERASPRAY MFG. CO., LTD.
122 & 123 Livery Street, Birmingham, England, & Branches.

Current Topics.

Sir Archibald Page.

SIR ARCHIBALD PAGE, the chief engineer and manager of the Central Electricity Board, has received a host of congratulations on the knighthood which has been conferred upon him, as recorded in our last issue. This well earned recognition of the energy and tact with which Sir ARCHIBALD PAGE is carrying out a task the magnitude and complexity of which can only be fully realised by those who have an intimate acquaintance with the work, has given great satisfaction to his many friends in the electrical world. During the war the phrase "work of national importance" was used to cover such a multitide of occupations, in some cases of a somewhat dubious value, that we hesitate to apply it to the work of the Central Electricity Board, though in its undefiled sense it correctly characterises the Board's activities, which are playing a vital part in the industrial reconstruction of Great Britain.

Physical and Optical Exhibition.

THE twentieth annual exhibition of the Physical and Optical Societies, which was held for three days in London this week, was even larger than that of last year. Though this exhibition is confined mainly to apparatus of a laboratory nature, its size and importance appear to grow with the years, indicating to some extent the tendency for greater recognition of research work. This year's exhibition showed in a very convincing manner the accuracy of our standards and the amount of time and research which must be expended and pursued before such accuracy can be attained. High frequency measuring apparatus, etc., has been greatly improved since the last exhibition, and those who have knowledge of the difficulties encountered when making measurements at frequencies over 30 000 kc will realise that any improvement, no matter how small, is an outstanding achievement. Generation of high frequency currents has also made some advance, and it is interesting to note that oscillation at frequencies which were regarded as high last year have now become almost commonplace in the manner of radiation and control. The exhibition may be regarded as representative of a very creditable year's work among manufacturers and physicists alike, tending towards further economy and more efficiency in the electrical industry as a whole.

Industry and Research.

AMONG the interesting subjects discussed at the educational conferences held in London and elsewhere last week, was that of the relations between science and practical life. The electrical industry as a whole will agree with Prof. WINIFRED CULLIS in the view that a piece of pure scientific investigation may bring to light knowledge which may be invaluable in industry. As an example, Prof. CULLIS is reported to have quoted the artificial silk industry, which, by the way, is not only a greatly electrified industry, but is furthermore based on the discoveries of Sir JOSEPH SWAN, the inventor of the incandescent electric lamp. Even this latter invention was not altogether independent of other researches, for it was partially due to Sir Joseph's knowledge of chemistry that he was able finally to develop a satisfactory filament for his lamp. In an industry such as ours applied science has played, and is still playing, a part unrivalled in importance in any other industry, and the sooner the rest of the industrial world realises the benefits which may accrue from a closer co-operation with science, the sooner will many of our trade problems be solved.

British Industries Fair.

THE next big exhibition which is engaging the attention of the electrical manufacturing world is the British Industries Fair, and though there is still a month before the opening, only a few stands, all of comparatively small dimensions, are now available, either in London or Castle Bromwich. The electrical exhibits promise to reveal much that is new, and including the many firms which showed last year, a number of "first timers" will occupy well over 25% of the total exhibition space. No details are yet to

Digitized by Google

hand with respect to the exhibits themselves, but from information gathered in conversation with manufacturers the 1930 Fair is likely to establish a record in the matter of new apparatus and machinery; one firm, for instance, claims to have perfected an industrial fan which gives greater efficiency at half the horse-power usually required, saving up to £2 000 per annum on running costs of a large equipment. In spite of the controversy which has prevailed in the past concerning the month in which the Fair should be held, we notice that with each year all such discussion ceases with the approach of February, while those taking part in the debate divert their labours towards making the Fair—even in February—a greater success than was the previous show. Such is the spirit in the electrical industry that, given a common cause, all differences are laid aside until the main issue is decided, and electrical trade, home and export, becomes even more established in the world markets. Team work plays no inconsiderable part in our big electrical undertakings, and it may even be said that it assumes equal importance in the industry as a whole. If the same spirit prevailed in our other basic industries, we venture to think that their future would be less precarious.

British Patent Record.

WHILE no revolutionary patents were applied for during 1929, the number of applications received by the Patents Office was approximately 40 000. Chief among these were those relating to electrical devices, such as cleaners, heaters, and other domestic appliances, indicating the rapid strides which domestic electrification is making in this country. Radio was, as usual, also responsible for the patenting of a number of new ideas chiefly concerned with devices for operating receiving equipment from the supply mains and rectifying a.c. to d.c; inventions of fundamental importance were, however, few and far between, and then the outcome of experiments in such subjects as television. Though the manufacturing world has adopted a cautious attitude towards new inventions, owing to their multiplicity, the number of improvements which have been made to existing apparatus is colossal, and since such eliminations or additions are invariably the subject of a patent application, the task of the Patent Office in avoiding duplication is no easy one. Inventive genius usually follows in the wake of demand, and since such a condition is invariably followed by sales we may take the 1929 patent record as an indication that all is well in the domestic electrical appliance trade and that demand, sales and new ideas are ever on the increase—a very good omen for the new year.

Public Picture Telegraph Service.

ON Tuesday afternoon a regular public service of picture telegraphy between London and Berlin, of which we give a description on another page, was opened for traffic. A service was previously at work on the Continent between Berlin, Copenhagen, Frankfurt, Stockholm and Vienna, and Munich will be added in a month or two. If the new service between Great Britain and Germany proves a commercial success it is likely to be extended between London and the cities named. The chief obstacle to such expansions is lack of circuits. In the case of Paris it is not regarded as probable that a public service will be established, at any rate in the immediate future. Various private transmissions have been operating between London and Paris and internally in Great Britain for some time past, but the systems employed differ from that used by the Post Office. The Siemens-Carolus system which has been adopted for the public service between London and Berlin, and is at work between the Central European cities previously mentioned, has, it is claimed, certain advantages in dealing with photographs. In this field a very high degree of success has been achieved. There is still a tendency to exaggerate the intensity of blacks and whites, and occasional interference from induction is experienced, but the results achieved by experienced operators are really remarkable. The extent to which the new service will be used is unpredictable, but this will depend to a considerable extent on the manner in which its existence and capabilities are made known to the public.

Telephone Progress.

WHEREAS this year Great Britain proposes to spend about £10 500 000 on telephone development in this country, the American Telegraph and Telephone Co. has made plans calling for the expenditure of over £140 000 000 during the same period on extensions and developments in the United States. This unfavourable comparison is made all the more unpleasant by the announcement last week that at the end of September last 44% of the rural post offices and railway stations in this country were without public telephones, while in Northern Ireland the proportion was 69%. The American telephone system is already in a better state of development than our own, and when we learn that over ten times the amount to be expended in development in this country is to be devoted to further improvement in the United States, the smaller amount appears to be hopelessly inadequate. Even making all allowances for America's larger population and area, the ratio of £10 500 000 to £140 000 000 is obviously absurd.

Overhead Lines.

AT next Wednesday's meeting of the Overhead Lines Association the subject for discussion will be: "How far is recent criticism of overhead transmission lines deserved?" A large number of invitations have been sent to persons interested in the subject and it was hoped originally that it could be made a joint meeting with the Council for the Preservation of Rural England. The latter body has preferred to circularise the invitation to its members and we understand that it will have a number of representatives at the meeting. We hope that this will prove to be the first step towards a much needed substitution of collaboration for controversy. If, as the result of consultation between the interests concerned, friction can be avoided or, at least, reduced, one of the aims which all good engineers should have constantly before them will be greatly furthered and the task of extending electricity supplies in rural districts will be made easier.

Our Annual Review.

OUR first Annual Review number, published on December 27th, has met with a very gratifying reception, and we have received a number of appreciative letters from all parts of the country. A few copies can still be supplied, but, in view of past experience with special issues of this journal, anyone wishing to obtain them would be well advised to make early application.

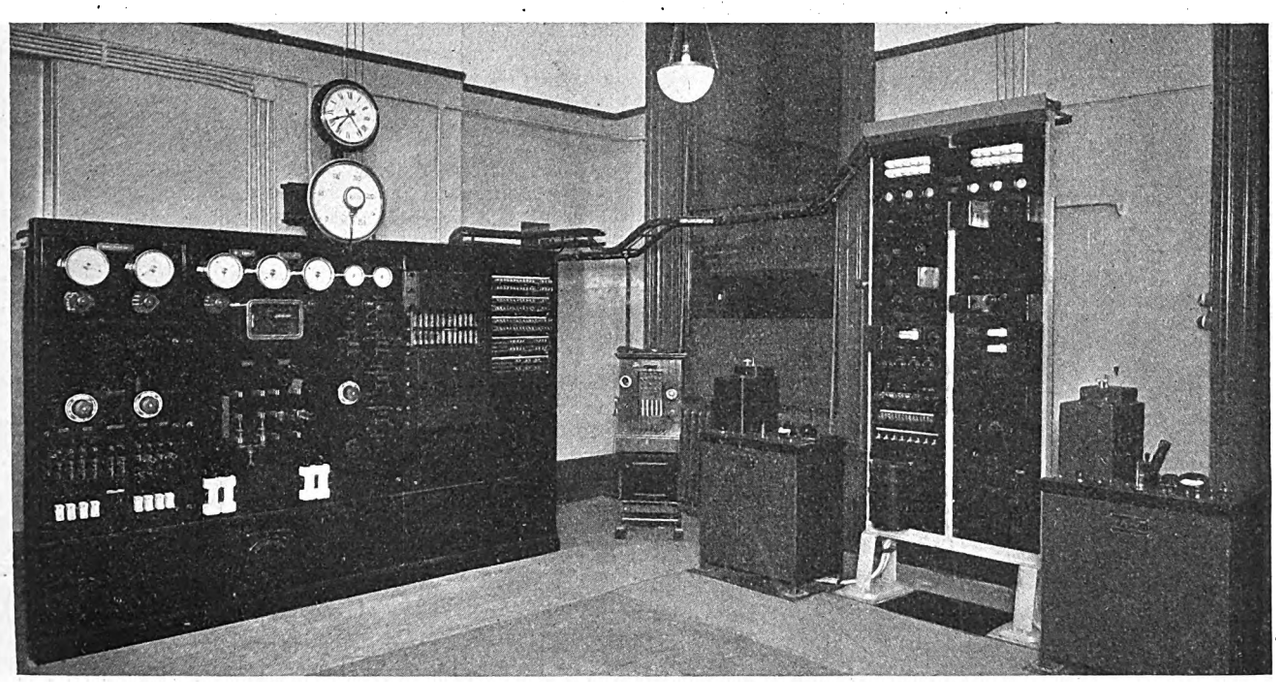
PICTURE TELEGRAPHY TO BERLIN.

Public Service Opened this Week—Description of the System Employed—Remarkable Accuracy Achieved—The Kerr Cell Condenser—Synchronisation and Phasing—Conditions Governing Good Reproduction.

WE are able to give below an illustrated description of the apparatus employed in the new public picture telegraphy service between Great Britain and Germany which was inaugurated on Tuesday afternoon. Almost any kind of picture—such as drawings, sketches and photographs—as well as printed type or writing can be transmitted. Extra copies can be delivered and negative films can be supplied at the receiving end in place of positive copies, if desired. The maximum size that can be dealt with is 25 by 18 cm. (approximately 10 by 7 in.), but larger pictures can be subdivided and sent in sections. The charge is at the rate of 2½d. per sq. cm. (about 1s. 4d. per sq. in.), with a minimum of £1 covering 96 sq. cm. (about 15 sq. in.). Normal hours of working are between 7 a.m. and 11 p.m.*

The system of picture-telegraphy employed on the London-Berlin service is the Siemens-Carolus. The transmitter and receiver are shown in the schematic diagram (Fig. 2) and a view of the apparatus in the London head telegraph office appears in this page. The cases of the cylindrical drums in which the picture is placed for transmission and, at the receiving end, in which the film or positive is made by the incoming impulses, are to be seen at the top of the sending and receiving apparatus on either side of the twin panels on the right of the photograph. On the left is the power switchboard for charging the necessary batteries, next comes the sending machine, then the control rack for the picture apparatus, including the necessary measuring instruments, and on the right is the receiving machine. On the control rack are mounted the amplifiers and alarm devices, the latter indicating any failure of battery voltage, as well as a telephone for speaking over the picture circuit.



The picture telegraphy apparatus and control panels at the London end. The transmitter is to the left and the receiver to the right of the two narrow panels.

For transmission, the original picture is clipped round a cylindrical drum with two spring clips. The long dimension of a full-size picture is measured round the circumference whilst the short dimension is parallel to the axis. The clips are parallel to the axis, and each covers about ·5 sq. cm., or ¼ sq. in., so that space for these should be left on the picture. When the apparatus is started the drum is rotated about its axis with uniform speed, and at the same time a photo-cell and an objective lens are carried past the picture by means of a rotating threaded spindle parallel to the axis of the drum. Suitable lenses and prisms are employed to throw a narrow pencil of light from a light source upon the picture, and to focus it there as a fine point. The dispersed light reflected from this small point on the picture will vary in brightness; the lighter the picture at the point, the brighter the reflected light.

This reflected light is caught in a photo-cell (Fig. 1), which consists of a hollow glass vessel coated on one side with a thin film of potassium. All the air has been extracted from the vessel and the potassium surface has been treated so that it emits electrons when light falls on it. The number of electrons emitted is within limits proportional to the amount of light falling on the cell. The free electrons are attracted to a positively charged open wire grid in the cell, whence they are conducted to the input of a valve amplifier.

When the transmitting drum rotates, the light spot and the photo cell "scan" the picture in the form of a spiral. Before reaching the picture the light is "interrupted" by means of a thin metal disc, revolving at a high speed in the path of the beam, and having on its circumference a number of teeth. It will therefore be seen that the tone values of the picture are reproduced (by the photo cell) in terms of an interrupted or pulsating direct current.

This pulsating direct current is converted into alternating current by the amplifier, and is sent from the transmitting station over a telephone trunk line to the receiving station, where it is amplified further and applied to the "Kerr cell" (Fig. 1). This consists of a small condenser immersed in nitrobenzole, and performs a function the reverse of that of the photo cell, namely, the re-conversion (without inertia) of the incoming electric current alternations to proportional light values.

A narrow beam of light is directed first through a Nicol prism, then between the plates of the Kerr cell condenser (through the nitrobenzole), and finally through a second Nicol prism. The output of the receiving amplifier is applied across the condenser plates. Under the influence of the incoming voltage, which corresponds to the photo-cell current at the sending station, and therefore with the tone values of the original picture, the light passed varies in intensity in accordance with the voltage fluctuations. By means of suitable

* Leaflets giving particulars of the service are obtainable at head post offices throughout the country and at London branch post offices.

Digitized by Google

apertures and lenses the beam is then focused to a fine point on the surface of the receiving drum, which carries a light sensitive photographic film and rotates in a light tight cylindrical housing. The light point traverses the film in a close spiral, in the same manner and at the same speed as the light spot on the picture at the sending end, and (so to speak) photographs each individual point of the distant picture. There is thus obtained at the receiving station a negative

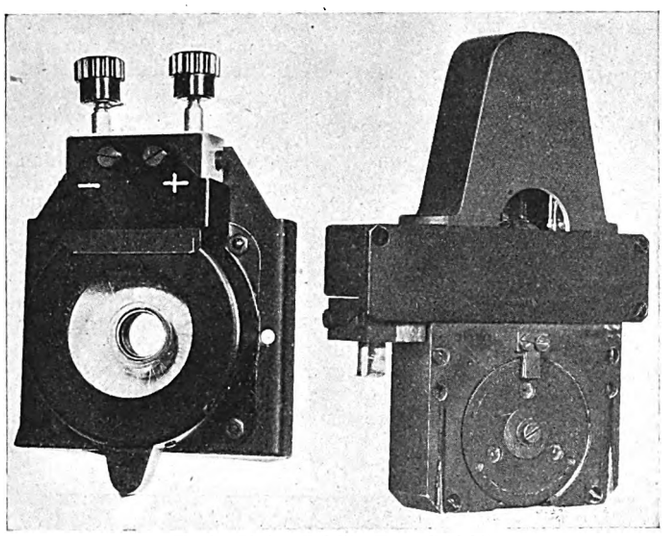


Fig. 1.—Photo cell (left); Kerr cell (right).

which, when developed, fixed, hardened and dried, reproduces the original picture in form and tone. Any number of prints may be made from this negative in the ordinary way.

It is necessary that the drum of the sending machine rotate at exactly the same speed as the drum of the receiving machine; if it does not do so, the received picture, instead of being a rectangle, will be distorted into the form of a parallelogram.

To illustrate the exactness with which the machines work, it is not unusual to find that a full-size picture is 1 mm., or about ·04 in., out of being a true rectangle. This means that the light spot in one machine has travelled 1 mm. more than the spot in the other machine after traversing 248 000 mm., or is four-hundredths of an inch out in about 813 ft. That this result is wonderful will better be realised when it is mentioned that the time of transmission of a picture is about twenty minutes. What other two instruments separated by a distance can compare with this result other than an accurate clock or watch?

Synchronisation is effected without transmitting a synchronisation frequency over the line (except as a check before the transmission of the first picture), but is accomplished by means of tuning fork oscillators, one at the sending end and one at the receiving end (or ends) when the picture is being received at more than one station. The forks themselves are adjusted to be of identical frequency and are maintained at a constant temperature by means of thermostats. As a result there is available at each station an alternating current of exactly the same frequency, which, after amplification by means of valve amplifiers, is used to control an alternating current synchronous motor or phonic wheel. Coupled to this motor, on the same shaft, is a direct current motor, the speed fluctuations of which are checked by the phonic wheel.

Phase Synchrony.

Besides the setting up of identical speeds it is further necessary that the drums at all stations should rotate in phase, so that the picture margins in the transmitter may correspond in position with those in the receiver. Phasing is done by a temporary acceleration of the receiving motor, accomplished by rotating the stator of the receiver phonic wheel. The adjustments of phase and synchronisation are made by the operator at the receiving end, and are checked by special signals sent over the line.

The carrier current frequency for picture transmission should be as high as possible, having due regard to the characteristics of the line. For the London-Berlin service the frequency used is 1 125 cycles. As one of the principal requirements of a picture is sharpness, that is, the transit from white to black in the shortest possible interval of time, one line requirement is that the carrier current be established or extinguished quickly. This can only be the case when all the frequencies transmitted for the picture arrive at the receiving end at the same time. A lump or coil-loaded line tends to have a longer time for transmission of the higher frequencies, until at the cut-off or critical frequency nothing is transmitted.

Other necessary conditions for good pictures are

(1) The line must be free from momentary or other interruptions.

(2) The attenuation of the line must not vary appreciably throughout its transmission range.

(3) The attenuation must be constant and not vary from moment to moment.

(4) The line must be free from echoes and other irregularities.

(5) The line must be reasonably free from cross-talk, ringing induction, telegraph induction and noise.

(6) The telephone repeaters must not introduce spurious frequencies by modulating the carrier wave.

(7) The cut-off frequency should be as high as possible.

The carrier frequency should not exceed half the cut-off frequency, and high pass filters are required at the sending

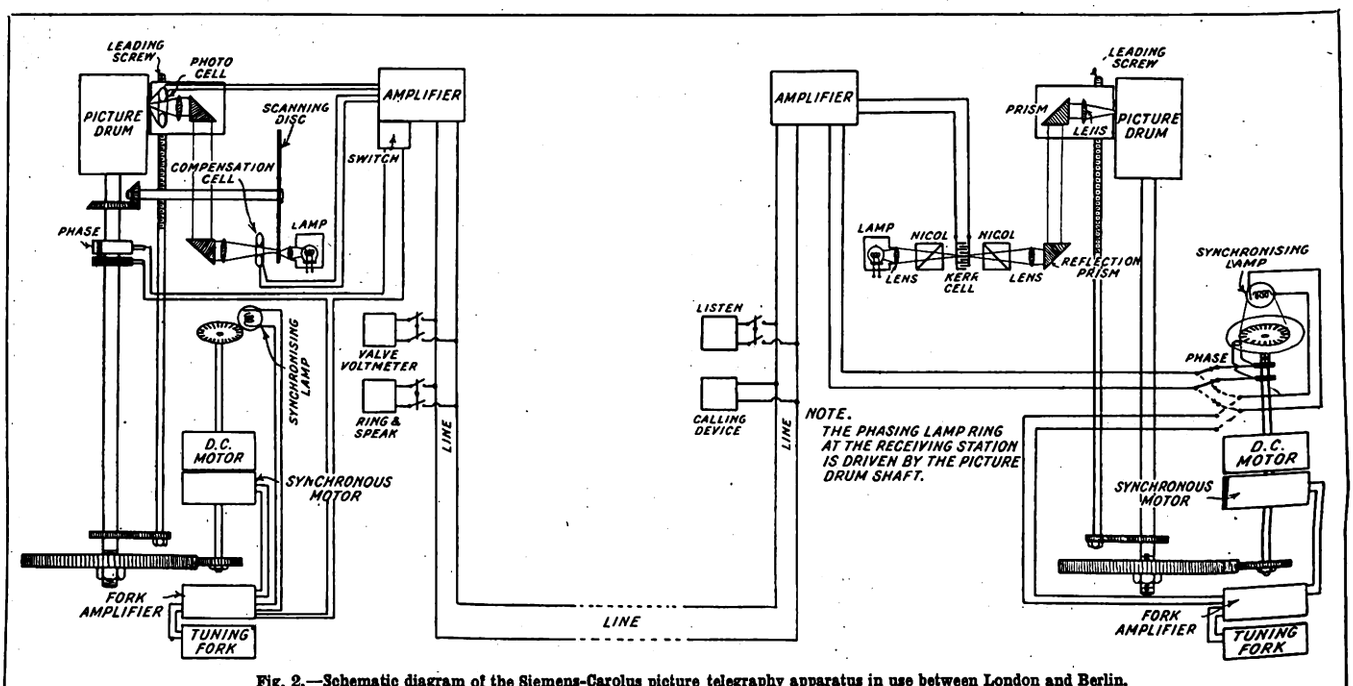

Fig. 2.—Schematic diagram of the Siemens-Carolus picture telegraphy apparatus in use between London and Berlin.

Digitized by Google

and receiving ends to cut off all below about half the carrier frequency.

Some of the operating troubles experienced during the experimental period on the London-Berlin circuit, which is about 1 000 miles long and consists of cable throughout, included the difficulty of holding synchronism with the driving motor supposed to be running off the 120 V telegraph battery during the daytime, though in the evening it ran satisfactorily. The motor was changed over to the lighting system and ran well. It was found afterwards that during the day the supply came from motor-generators and there were considerable fluctuations in voltage.

Ringing induction from harmonics in 17-cycle ringing current caused interference on the pictures occasionally. This induction came from side circuits and the trouble was removed by changing to other pairs.

A fifty cycle per second modulation of the picture carrier wave was experienced frequently, particularly during the daytime. This was traced to the anode current supply from a rotary convertor.

Public picture offices exist on the Continent at Berlin, Frankfurt-on-Main, Vienna, Copenhagen and Stockholm; and it is understood that arrangements are in hand for extending the public service from this country to those Continental centres if traffic inducements warrant the provision of further facilities.

NEW YEAR GREETINGS BY PICTURE TELEGRAPHY.

CARD, as received in London by telegraph from Berlin. It will be noted that the names of the other stations which are already at work appear on the card. This is interesting as an example of transmission of a photograph and lettering at the same time.

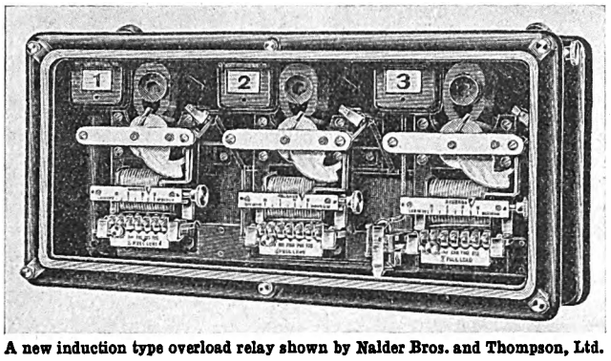
THE PHYSICAL AND OPTICAL EXHIBITION.

Brief Details of Some of the New Electrical Exhibits at the Imperial College, London —Instruments of Precision Form Chief Interests.

THE twentieth annual exhibition of the Physical Society and the Optical Society was held at the Imperial College of Science, South Kensington, London, on Tuesday, Wednesday and Thursday, many of the exhibits being staged by firms engaged in the electrical industry. In some cases apparatus exhibited this year was also shown in 1929, and in reviewing the more interesting items of this year we have confined ourselves to equipment of recent design. It will be appreciated



A new induction type overload relay shown by Nalder Bros. and Thompson, Ltd.

that even in these circumstances it is not possible to deal adequately with each exhibit, nor will space requirements permit of every such piece of apparatus being mentioned. Should readers desire further information regarding the items dealt with, we suggest that application be made to the exhibitors whose names and addresses are given for this purpose.

A new type of bridge, developed by Albert Campbell, and shown by the CAMBRIDGE INSTRUMENT CO., LTD., of 45, Grosvenor Place, London, S.W.1, may be regarded as an extension of the three-arm Carey Foster bridge by the addition of a fourth arm which is variable and of low resistance. The capacitance of the condenser under test is read directly on a conductance box which forms one of the other arms, and is obtained in terms of a fixed mutual inductance, a most permanent type of standard. The power factor at a given frequency is proportional to the fourth arm, and can be read directly on a slide-wire, one division corresponding (at standard frequency) to 0·0001. For the smaller capacitances it is desirable to use a one-stage amplifier. The instrument covers a range from 1 μμF up to 10 μF. From 100 μμF upwards the capacitance sensitivity at 800 cycles per second is of the order of 1 in 10 000.

Several examples of an instrument having a new movement using Mumetal irons were exhibited by CROMPTON PARKINSON, LTD., Instrument Works, Chelmsford. These instruments give readings on either d.c. or a.c. of any commercial frequency within the limits of first grade accuracy as laid down in B.E.S.A. Specification No. 89 of 1926. The movements are of very light weight, the torque/weight ratio is high, and the pointer comes to rest at any part of the scale within 2 seconds in the 6 in., and 3 seconds in the 8 in. size. Instruments with exposed movements for demonstration purposes were exhibited.

A new pattern of "Luxometer" portable photometer was shown by EVERETT EDGECUMBE AND CO., LTD., 117, Victoria Street, London, S.W.1. It embodies all the improvements which years of experience have indicated. The whole equipment is contained in a compact leather carrying case and includes a 4 V accumulator, a voltmeter with regulating resistance, and a separate test-plate with adjustable levelling and orienting devices. The instrument has four or five ranges (0·2 up to 0-2 000 foot-candles), and colour filters for daylight measurements are available.

EVERSHED AND VIGNOLES, LTD., Acton Lane Works, Chiswick, London, W.4, demonstrated a working exhibit designed to show the operation of the "Megger" earth tester. A model was constructed showing the testing of the earthing of a sub-station, and not only reproducing faithfully the actual type of earth resistance, but showing clearly the fact that the "Megger" earth tester is not affected by back voltage and stray currents. Although the model was a scale one, the full-size instrument was used, and conditions were very similar to those encountered in field work. A development was shown in the new "Dionic" water purity meter, which was exhibited both in the indicating and recording types.

Among the apparatus shown by GAMBRELL BROS., LTD., Merton Road, Southfields, London, S.W.18, was a $\frac{G}{C}$ bridge. This bridge has been designed by Dr. L. G. Brazier, of Callenders Cable and Construction Co., Ltd., for the precise measurement of the power factor of telephone cables at frequencies up to the audio limit. The measurement has to be made with the potentials of the two wires symmetrically disposed with respect to earth, so that stray capacity difficulties cannot be solved by placing an earth connection on the bridge. It is necessary for the effective capacities of two points of the bridge to be reduced to zero, and for this purpose elaborate screening arrangements are necessary.

A range of control gear recently designed for operating on a.c. supply mains to meet the generally increased demand for changing over from local supply to the "grid" system was exhibited, by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C. The "AAA" type startor was shown, and this is for directly connecting across the mains motors up to 7½ H.P. The startor is fitted with a duplex thermal time limit overload device, giving ample protection to the motor both during starting and running. This overload allows a time interval to take care of starting inrush and momentary overloads without tripping. However, when an overload becomes dangerous the motor is disconnected from the line. For motors larger than 7½ H.P. star delta startors were shown up to 15 H.P., and above this horse-power, where slip-ring motors are used, resistance type controllers were exhibited. All these controllers are arranged for remote control either by means of push-buttons, pressure devices, float switches, or vacuum devices.

Chief among the exhibits of Mr. O. E. MALINVERNO, 37, Walbrook, London, E.C.4 (representing Messrs. Istrumenti di Misura "C.G.S." of Monza, Italy), was the Frequencygraph described in our December 27th issue. The instrument shown, however, was of the type intended for the British market whereas that illustrated in the December 27th issue is as supplied to the Italian market. There is little difference between the two instruments so far as appearance is concerned and none at all with respect to technical construction.

This year's display by the M.O. VALVE CO., LTD., Hammersmith, London, W.C.6, again consisted of working demonstrations illustrating various interesting processes in the manufacture of valves, including automatic grid making, and technical dmonstrations designed to show the comparative power outputs of valves. So far as other exhibits are concerned, these were somewhat numerous in character, but were entirely indicative of recent developments in valve production. Special cooled anode valves of the types supplied to the G.P.O. and the B.B.C. etc., figured among them, together with e.h.t. rectifiers, dull emitter transmitting and modulating valves, large valves (incorporating molybdenum electrodes), screen-grid valves, pentodes, power valves (receiving), a.c. mains, valves (both directly and indirectly heated), full-wave rectifiers and repeater valves.

Domestic Convertors.

The introduction of a.c. mains-operated receivers and amplifiers, and the comparative absence of apparatus to work direct from d.c. mains, has made it desirable that a machine should be available which can be connected to d.c. mains and which will supply alternating current for the operation of these receivers. The d.c. to a.c. rotary transformer, exhibited for the first time by the M-L Magneto Syndicate, Ltd., Coventry, has been specially designed for this purpose. It can be wound to run from d.c. mains of any voltage, a country house private d.c. supply, or small accumulator. Particular applications of this type of machine would be found on ships where d.c. is always available, and on demonstration vans where a 12 V startor battery forms the only power supply. The models shown had outputs of 40 VA and 85 VA, at 200-250 V, 50 cycles.

The MULLARD WIRELESS SERVICE CO., LTD., Charing Cross Road, London, W.C.2, showed a complete range of P.M.

Digitized by Google

products, including examples of the most recent developments in indirectly heated cathode valves for a.c. mains and power output valves suitable for operating batteries of loud-speakers. Rectifying valves with outputs from 30 mA at 250 V to 2 A at 12 000 V were also shown.

Among the exhibits of NALDER BROTHERS AND THOMPSON, LTD., 97A, Dalston Lane, London, E.8, was a new induction type overload relay. This instrument is described as inverse, with adjustable definite minimum time delay characteristic specially designed for the protection of the "grid," supplied in single, double and triple pole units. An illustration of the instrument is given on the previous page.

The increased importance of X-ray crystallography makes an apparatus for the examination of single crystals and crystal aggregates desirable for any well-equipped physical or chemical laboratory, and its use is becoming more and more necessary in technical research laboratories, particularly for metals and textiles. W. G. PYE AND Co., Newmarket Road, Cambridge, showed such apparatus, and by use of interchangeable parts all the standard methods of photographic investigation can be used, and in order to facilitate investigation, particularly in laboratories which are not primarily crystallographic, optical measurement of crystals can also be carried out, thus dispensing with a separate goniometer. The instrument is also so constructed that practically any special type of research, such as, for instance, high or low temperature work, optical or X-ray spectrometry, can be carried out by means of special attachments of the carriages.

The RECORD ELECTRICAL CO., LTD., Broadheath, Manchester, showed a complete range of moving iron and moving coil switchboard and portable instruments, including a combined voltmeter and ammeter consisting of two separate moving iron movements arranged in one case. The voltmeter is provided with five ranges from 1-750 V. On the current side, a change of range is produced by altering the series coils, such coils being slipped over the moving iron element, which is protected by a sleeve, and held in position by guide rods, and clamped by winged nuts. Six coils are provided in the standard model, giving ranges from 0-1 to 0-600 A. Each range has a separate scale marked on a drum, which rotates by depressing two knobs at the end of the drum, thus overcoming the disadvantages of having many scales on the one dial. The test set is complete in itself, all the coils being housed in a receptacle in the case.

Continuous chart temperature recorders, distance thermometers, thermo-electric pyrometer stems and switchboards, optical pyrometers, and similar apparatus were shown by SIEMENS BROTHERS AND CO., LTD., of Woolwich, London, S.E., whose exhibit at this exhibition can always be relied upon to reveal something of outstanding interest.

Unbalance Measurements.

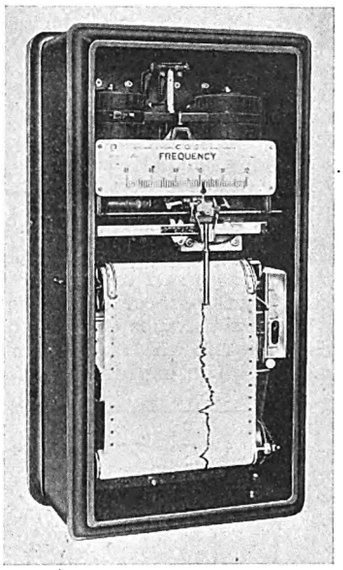
The stand of H. W. SULLIVAN, LTD., Leo Street, London, S.E.15, contained the usual comprehensive display, including a new form of double capacity bridge mounted and screened in one desk, and designed to permit determinations of the out-of-balance capacities of telephone cables. The accuracy of measurement is that which it is thought will be demanded of telephone cable manufacturers in the near future. A multi-functioning switch, having a rotary dial of fifteen testing positions, is incorporated to effect "between quad" unbalance measurements as well as the more usual "within quad" unbalance measurements. This extension of the usual testing is now under consideration by the C.C.I., and at the request of manufacturers the switch has been designed to perform the complete series of tests. Means are provided for the elimination of any initial unbalance due to switch or testing lead. Resulting from the special feature of range extension employed in the differential air condensers, a total unbalance of 1 600-0-1—$\mu\mu$F is obtained with a very high degree of accuracy. Although having such a wide range of capacity adjustment it is possible to measure unbalances of 1 or 2 $\mu\mu$F with ease.

A new range of external thermo-couple junctions, air cooled, having exceptionally heavy overload capacities and suitable for d.c. and a.c. circuits of all commercial, low and high radio frequencies was shown by Messrs. ERNEST TURNER, Chiltern Works, Tolleridge Avenue, High Wycombe. The Wheatstone bridge type is for use on a.c. circuits only. All external junctions have standard external dimensions.

Laboratory standard instruments, etc., were exhibited by the WESTON ELECTRICAL INSTRUMENT CO., LTD., 15, Great Saffron Hill, London, E.C.1, including a new range of small instruments having a sensitivity of 125 Ω per volt.

A high temperature electric furnace, of larger size than hitherto shown, was featured on the stand of WILD BARFIELD ELECTRIC FURNACES, LTD., Elecfurn Works, North Road, London, N. This is heated by means of re-crystallised carborundum heaters accommodated in the specially grooved refractory lining which, it is claimed, adds to the efficiency by ensuring more uniform radiation.

The ZENITH ELECTRIC CO., LTD., Zenith Works, Villiers Road, Willesden Green, London, N.W.2, showed new types of tubular adjustable rheostats on heat-resisting steel and porcelain tubes, including patterns fitted with the latest form of patented sliding contact and guide bar, arranged for bench and switchboard mounting incorporating a patented end bracket clamp. Several types specially designed for meter and instrument calibration were shown.



The Frequencygraph exhibited by Mr. O. E. Malinverno, which is designed to meet the requirements of the British market.

Other electrical trade exhibitors were: Bakelite, Ltd., Creed and Co., Ltd., Dexine, Ltd., Drayton Regulator and Instrument Co., Ltd., Edison Swan Electric Co., Ltd., W. Edwards and Co., Electrofio Meters Co., Ltd., Elliott Bros. (London), Ltd., Foster Instrument Co., Fuller Accumulator Co. (1926), Ltd., A. Gallenkamp and Co., Ltd., Griffin and Tatlock, Ltd., Isenthal and Co., Ltd., Kelvin, Bottomley and Baird, Ltd., Marconi's Wireless Telegraph Co., Ltd., Negretti and Zambra, Schall and Son, Ltd., Telegraph Condenser Co., Ltd., Thermal Syndicate, Ltd., H. Tinsley and Co. Venner Time Switches, Ltd., Watson and Sons (Electro-Medical), Ltd.

In the research and experimental section the BRITISH THOMSON HOUSTON CO., LTD., showed examples of hot cathode mercury vapour rectifiers, in which the space charge of an electron current from an oxide coated filament is neutralised by the ionisation of mercury vapour. It is interesting to note that this modern application of thermionics probably resembles very closely the earliest lime-coated filament valves made by Wehnelt over 20 years ago. In a hot-cathode mercury vapour rectifier the voltage drop between anode and cathode when the valve is passing current, depends upon the vapour pressure of the mercury which, in turn, depends upon the temperature of the coolest portion of the enclosing walls of the device. Usually this portion is near the base of the rectifier, and is protected from sudden changes in the ambient temperature. A rectifier was shown, however, in which the coolest portion is the exposed walls of the tube.

The research laboratories of the GENERAL ELECTRIC CO., LTD., exhibited experimental photo-electric apparatus for the rapid measurement and plotting of the Polar distribution of light sources; similar apparatus for measuring colour temperature or luminous output for incandescent lamps; equipment for indicating the absorption of light in lamp bulbs; electro-acoustic measuring apparatus, etc. A miniature transmission tower testing plant was shown, and this consisted of a model to the scale of $\frac{1}{16}$ in. to the foot, showing the general arrangement of the field, test towers, and gear necessary for the load testing of overhead transmission towers. Other exhibits included a simple method for the approximate determination of the diffusing power of etched glasses. The extent to which an etched glass will diffuse the beam from a projector can be approximately determined by placing a sheet of printed matter behind the glass and measuring the distance to which the print can be removed from the glass before it becomes illegible. It has been found that by using a fixed size of print an empirical but stable relationship can be obtained for any particular projector between this distance and the beam divergence figure. Experimental methods of furnace temperature control by means of photo-electric cells were shown, in which the standard Osram photo-cell unit was arranged with a Caesium cell to control the temperatute of a furnace by the light radiation from the object being heated.

HOW WELDING ASSISTS THE MAINTENANCE ENGINEER.

Ad hoc Gadgets—Vibration Breakdown—Value of a Welding Plant—Some Instances of Effective Use of Welding.

By CYRIL SYLVESTER, A.M.I.E.E., A.M.I.Mech.E.

THE job of the maintenance engineer of any electrical plant is not to be envied. He is known as the "trouble man." He never knows what trouble is in store for him; he gets more kicks than plums and he is looked upon as an essential nuisance. Immediately a breakdown occurs it is considered that he has neglected his duty; it is thought that electrical machinery should be entirely immune from breakdown. When a machine stops through any unusual means, or a motor driving a length of shafting refuses to function, the maintenance engineer is sent for and the question asked is, "How long will it be before it is going again?" The maintenance engineer has need to be in possession of unlimited resources to satisfy the expectations of many inquirers.

The maintenance engineer has any amount of *gadgets* in his possession which are never seen outside his department—gadgets which expedite his work. Most of them are of his own design. Some of them have been used only once; to meet some special requirement. Others, more frequently used, will accomplish in a few minutes what ordinary apparatus does in an hour. These gadgets have come into existence through experience born of necessity. A dowel pin can be extracted, a key from a pulley removed, or an armature taken from its shaft and other mechanical operations performed by means of the gadgets I have mentioned—and this in quick time.

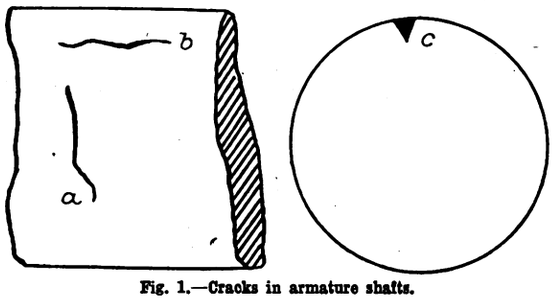

Fig. 1.—Cracks in armature shafts.

In all electrical machinery there is a certain amount of vibration; in some it is more pronounced than in others. Where there is vibration the tendency is for parts to work loose. Loose parts are dangerous even though a machine containing them may have the best of maintenance. It may be said, with some truth, that the majority of mechanical breakdowns to electrical plant can be traced to something or other working loose and releasing that which its function is to secure. It is on occasions like this that the maintenance engineer has to do some serious thinking.

Although a plant may be duplicated as far as possible; that is with what, under ordinary conditions, may be considered as ample "spares," there are many parts of a plant for which no spare part is available. It is here that a repair has to be effected with material on site. For certain classes of breakdown I know of nothing more helpful to the maintenance engineer than a welding plant. I will elaborate upon a few points within my experience where a welding plant has greatly assisted me.

Armature Shafts.

One case concerned a 500-B.H.P. motor installed for starting and running in large Diesel engines. The motor was, of necessity, a slow speed one. It is well known that internal combustion engines, no matter how carefully the shaft is balanced, operate with an impulse movement; this is more pronounced if one or more cylinders are "missing." The effect is that these impulses are transmitted through the couplings to the armature, in this case, of the starting motor.

Such an armature is very heavy and, providing the turning movement is smooth, a large amount of kinetic energy would be stored in it. The effect of the impulses, however, at starting, when the cylinders commence to fire, is to create a tendency to increase speed at a greater rate than the energy can be stored in the armature. This, with the impulse characteristic of the power transmission, causes a continual twisting movement which affects the junction of the armature shaft and the spider, the keys which lock them together.

Continual movement of the keys will distort the keyways so that, very quickly, the keys are no longer square; they become loose in their ways. In the case referred to, the shaft was 6 ins. in diameter, and four keyways were accommodated in it. A new shaft was not at all necessary; the existing keyways were filled in by a process of welding and new ways were cut in other portions of the shaft.

The tensile strength of the welding material was not so great as that of the shaft proper. This, however, was not an important factor since the material in the shaft was more than ample for the power transmitted. The function of the filled-in portion was to provide a round seating for the inside of the spider. After welding, the shaft was skimmed in a lathe. The new keyways were cut with a portable milling machine operated by a one-H.P. motor.

Shearing Due to Cracks.

Another case, while we are on the subject of motor armatures, is the shearing (for no apparent reason at all) of an armature shaft. I have known this shearing effect to occur at a coupling in the middle of a shaft and at the thrust collar, in the latter case it is due to the hardening effect when shrinking the collar on to the shaft; in the former case it is due to cracks in the material.

The cracks cannot be seen under ordinary conditions. They usually appear after the armature has been running for some time, when certain temperatures have been reached. When a bearing has seized on to a shaft, after it has been removed, the crack is apparent from the fact that it is filled in with bearing material. It may be said that, in many cases, the opening out of the crack has been the cause of the seizure; the edge of the crack acts as a milling cutter, material is removed and the bearing becomes hot.

The cracks vary in character. Some are short, some long, some run partially round the shaft as illustrated in Fig. 1 (*a*), others run along the shaft as illustrated at (*b*); sometimes they are at various angles between the two. Every time an armature is changed the shaft should be inspected for cracks. A strong magnifying glass may reveal them; a simpler and surer method is to use red lead. The shaft is first thoroughly cleaned and polished. A thin mixture is then made of red lead and petrol. The shaft is smeared with the mixture, and in a few minutes, when the petrol has evaporated leaving only the lead behind, the shaft is wiped clean. On examination it will be found that the lead has penetrated into the cracks so that, if they cannot be readily seen with the normal eye, the use of a glass will reveal them.

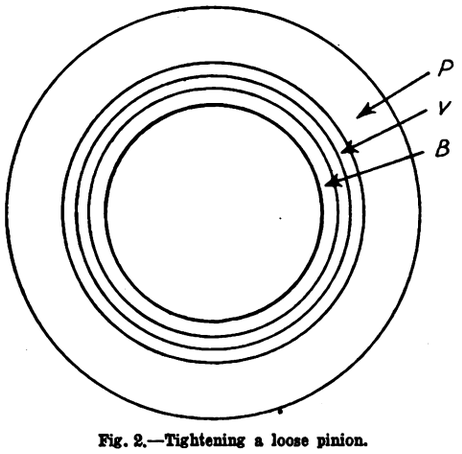

Fig. 2.—Tightening a loose pinion.

The only treatment is welding, and the method adopted is illustrated in Fig. 1 (*c*). A groove, following the crack, is cut in the shaft with a three-cornered file to a depth of $\frac{1}{16}$th of

Digitized by Google

an inch. This is filled in with material in a process of welding. The surplus material is turned off, the shaft is ground and further trouble from this cause is eliminated.

The necessity for quick action on the part of maintenance engineers has been mentioned. A favourite gadget to facilitate quick action is the grub screw. If a motor is fitted in an awkward position (from an accessibility point of view) the keyway of the pulley will be fitted with a set screw; this facilitates easy removal in case of breakdown. There are many positions in a large plant where grub screws are used; but they are dangerous and, often, can be dispensed with.

Let us consider the case of an electric traveller in a machine shop. Each motor is fitted with a pinion which engages with a spur wheel. The pinion is fitted to the shaft through the ordinary key and keyways. Traveller motors are subjected

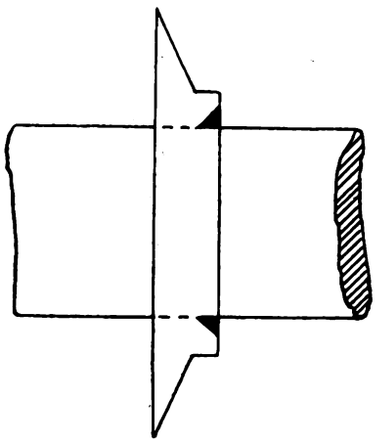

Fig. 3.—Welding a loose shaft collar.

to intermittent loads of a varying character. Their speeds vary from a few hundred revs. per minute to more than a thousand; the breaking effect is often severe, so that, invariably, the pinion key works loose, the pinion becomes loose so that the exterior of the shaft and the bore of the pinion are no longer concentric.

The remedy here is either a new pinion, or *bushing* the bore; the latter method is usually adopted and our friend the grub screw plays a prominent part in securing the bush to the pinion. If the bush is a thin one, the screw will be thin, and (I have seen it on many occasions) it may become sheared, thus leaving the bush free inside the pinion.

This is one of the cases where a grub screw should not be used. Welding is the solution. The bush should be a tight fit in the pinion. Both should be placed in a lathe on a mandrel and a Vee groove cut as illustrated in Fig. 2; here B is the bush; V the groove and P the body of the pinion. Both sides of the pinion should be treated in the same manner and the two grooves filled with material under a process of welding. After welding, the sides may be "faced" and the pinion is then as good and as strong as is necessary for the work it has to perform.

Loose Shaft Collars.

Reference has been made to thrust collars being shrunk on armature shafts. This method is not always satisfactory, since, as a rule, the material with which the collar is made and that of the shaft have different coefficients of expansion. Many collars work loose after a certain temperature has been reached, not only on armatures but on large turbo units. I know of several turbines in this country which are operating with thrust collar fixed to the shaft by the conventional method—the grub screw. On the other hand, I have known collars to be so tight that no method of heating would release them; they have had to be cut off.

Welding obviates the necessity for shrinking or fixing with set screws. If the collar is cut, as illustrated in Fig. 3, in the form of a Vee, and the Vee filled in with material, a good sound mechanical job is made of it. The Vee is cut on the back side, not the bearing side, so that it is not at all necessary to trim the surface of the weld. If it is necessary to remove the collar, if the armature is placed in the lathe a small tool passed along the shaft will part the material so that the collar may be tapped off.

These are but a few of the occasions where a welding plant would assist the maintenance engineer. But their name is legion. Special bolts which have broken can be welded; eccentric holes in couplings can be filled and re-drilled; scored dowel pins can be filled and re-used; and cracked castings can be made as new. One has no cause for anxiety about the strength of a weld. If these are made properly, with the right material, the tensile strength will be almost equal to that of the original material. One thing is certain; the maintenance engineer will have an easier time and the size of his scrap heap will very soon diminish.

TIN RESEARCH.

Industrial Applications Committee's Plans for 1930.

A COMPREHENSIVE plan of research for 1930 is announced by Col. S. Heckstall-Smith, honorary secretary of the Tin Industrial Applications Committee, which is working in co-operation with the British Non-Ferrous Metals Research Association to investigate the industrial applications of tin and discover new and improved uses for the metal.

The most important lines of research will be:—

1. To investigate the non-corrosive qualities of tin in relation to other metals with a view to establishing scientific data as to its industrial value.

2. To investigate improved methods of alloying tin to steel plates with a view to broadening the market for canning of foods.

3. To investigate the value of tin in relation to the lubrication of high speed machinery.

4. To establish the non-toxic qualities of tin as the safest metal to be in contact with milk and other foods.

Colonel Heckstall-Smith points out that 1930 opens up a new era in the tin industry. "For the first time the producers have got together and formed a strong association; they have also declared a policy of supporting research work. The importance of tin research cannot be over-estimated. Already research on other metals has borne fruits of far-reaching significance to the world's industries.

New Lead Alloy.

"Quite recently, for example, a ternary lead alloy was discovered by the British Non-Ferrous Metals Research Association. This alloy, which is destined to find widespread applications in certain sections of the engineering, the building, the electrical and the plumbing industries, is not only stronger and lighter than lead, but possesses a greater resistance to corrosion and vibrations, and, in working, will prove to be considerably cheaper. This British triumph, of which we can be justifiably proud, should open up new fields for tin consumption amounting to many thousands of tons a year. Another valuable contribution from research is the range of British Standard solders containing the right amount of tin, which guarantee industry materials which are stronger and work better than the fortuitous grades previously available.

"We have before us other lines of research which cannot be disclosed at the moment. We believe we are on the eve of finding some vitally important new uses for tin, but prefer to make no claims until we have assured ourselves that preliminary experiments can be amply substantiated."

PRESSBOARD INSULATION.

Economical New Material with many Electrical Uses.

WHAT is claimed to be a new development in pressboard insulation has been made by B. S. and W. Whiteley, Ltd., Pool Paper Mills, Pool-in-Wharfdale. The manufacturers of "Elephantide," as the material is called, state that the product has been developed on sound lines during the last few years and its appearance on the market was in time to benefit the manufacturers of large power transformers for the various electricity schemes. The performance of the material under hot oil—i.e., working conditions—has, we understand, proved satisfactory in all cases. Owing to the unusually large sizes of sheets available the material is economical, and other fields of use in the electrical industry are being developed, with resultant saving in cost of raw material and often an increase in insulation value.

Birmingham Electric Supply Committee has decided to open small branch service depots or showrooms from time to time in various suburban areas for the convenience of customers and prospective customers.

MANUFACTURERS' EQUIPMENT.

New Plant and Materials for Factory and Workshop—Aluminium-Silicon Alloys—Electric Crane Insulation.

MANUFACTURERS and others may be interested in a modified aluminium-silicon alloy, known as "Alpax," of which we have recently obtained details. It is produced by ROWLAND HILL AND SONS, LTD., of King Street, Coventry, and is stated to be particularly useful when Admiralty Spec. DNC/M/1A and Air Ministry Spec. DTD/25 are called for; when castings should resist exposure to salt spray or immersion in salt water; when high fluid or gaseous pressures demand freedom from porosity and cracks. (In this connection it is stated that "Alpax" castings have withstood, on test, air pressure up to 200 lb. per sq. in., with working pressures up to 75 lb. per sq. in.) Fourthly, when intricate design, lettering or large castings of thin section require from the alloy the utmost fluidity and complete freedom from hot shortness.

Sand castings can be subjected to anodic oxidation, which is effected by the firm's patented electrolytic process. The castings to be treated form the anode in a chromic acid bath, and the film can be deposited on machined, polished and sand cast surfaces. When this process is to be used, it is essential that all machinery and polishing be carried out before treatment, and that, owing to the action of chromic acid on bronze, steel, etc., no bushes or studs be fitted until after the treatment has been given. The oxide film may be usefully waterproofed in instances where the castings have a water line area.

Special Insulators.

ALFRED WISEMAN, LTD., Glover Street, Birmingham, have sent us particulars of their latest output of insulators and fittings for use on electric cranes and in the electrification of mines. The insulators are made of the firm's "Verus" compound, and insulated carriers and collectors for practically every condition of service are included. Among fittings may be mentioned a series of expanding bolts. The cone expanding nut has on it two projections, arranged to slide in the slots of the outer shell in such a way as to prevent the nut turning round. The outer shell is constructed of malleable iron with serrations on the outside. Two of the sides have grooves set at opposite angles of 45 deg., and the other two sides have concentric grooves. This method of arrangement prevents the bolt from turning round as well as from pulling out, when the shell is expanded in the hole. The bottom part of the shell is the same diameter as the outside of the serrations, so that the hole can be drilled parallel, and that the front part of the shell will fill the front of the hole. The washer provided has on its face projections which fit into a slot in the end of the shell. The external parts of the projection become embedded in the face of the wall or ceiling, so that turning cannot occur when the bolt is being tightened up.

As traffic congestion increases, and more and more severe demands are made for rapid electric transport, so are the trains on transmission gearing augmented—for quicker service is usually obtained at the expense of higher rates of acceleration and deceleration. At the same time it is essential that gear noises be kept at a minimum. To meet these conditions, Alfred Wiseman, Ltd., are now manufacturing gears and pinions of a special degree of hardness, but—it is claimed—free from distortion. Such gears and pinions are produced by two distinct methods. The first is to grind the teeth after hardening, the second is to use steel of a kind that can be hardened to a brinell of about 300, and have the teeth cut afterwards. Ground gears and pinions are supplied either split or solid, the split type being made from steel castings, and the solid type from forged steel containing 0·40% to 0·45% carbon. The pinions are always made from forged steel blanks, and both wheels and pinions are hardened and heat treated—after the teeth have been cut—to a brinell hardness of 450 to 500. The teeth are afterwards ground to within fine limits of accuracy. The maximum error of concentricity is stated to be 0·005 in. on gear wheels up to 30 in. diameter, and 0·002 in. on pinion wheels up to 12 in. diameter.

The alternative method—to have the teeth cut after the heat treatment of the steel—can be adopted in both the pinion and the gear wheel, or, if desired, the gear can be made in this form to mesh with a pinion produced by the other process. The more usual practice with the second type of wheel is to have a hardened forged steel ring shrunk on to a soft cast steel centre. The firm also supplies gear cases, paying particular attention to the fitting of the joints and to oiling arrangements. The gear cases are made in malleable iron, pressed steel, welded sheet steel or aluminium alloy. A form which is recommended as being strong and light is constructed of an aluminium-silicon alloy, said to possess a tensile strength of 12–14 tons, and an elongation of 12% in 2 in.

In connection with our remarks in THE ELECTRICIAN of November 8th, on the application of the thermal conductivity method of gas analysis to commercial purposes by the CAMBRIDGE INSTRUMENT CO., LTD. (of 45, Grosvenor Place, London, S.W.1), we give below some details of the way this method may be used to measure the percentage of sulphur dioxide in gaseous mixtures. Such measurement is necessary in various chemical processes, as for ascertaining the percentage of SO_2 in the gases given off from pyrite burners during the manufacture of sulphites and bisulphites. The gases from the burner pass through a cooler and are then by-passed, so that a sample flows past the meter, which is made of tin if there is any chance of moisture being present. There is usually a natural flow of gas which renders an aspirator unnecessary; a lead-lined acid-proof aspirator is supplied when needed. The rate of flow of gas over the meter is indicated on a bubbler, which is connected at the outlet of the system. Any traces of SO_3 in the mixture are removed before the gases reach the meter by passing them through a lead-lined filter.

Another application of the apparatus is the checking of the efficiency of the contact chambers in the contact process of manufacturing sulphuric acid. The method consists of measuring the SO_2 content in the ingoing gases, and in the gases which have passed the contact chamber and the SO_3 absorbers. Two meters may be used to give simultaneous measurements, and the results traced side by side on the chart of a recording instrument, or, alternatively, a single measurement may be made of the difference between the two compositions (that is, of the percentage of SO_2 converted) by using a differential meter, of which one cell is exposed to the entering, and the other to the effluent gases from the contact chamber. The outfit may be calibrated for a range of 0-8% SO_2.

ALLOY WELDING PROCESSES, LTD., of Ferry Lane, Walthamstow, London, E.17, claim that A. W. P. electrodes are of the type known as "flux-coated," with advantages not possessed by all electrodes coming under this heading. The wire used, after having been drawn from steel billets specially cast to the company's specification, is given a coating of nickel in accordance with the firm's patents. This coating it is claimed ensures that the surface is at all times free from rust or scale, it preserves the weld metal from oxide inclusions during the welding operation, and it adds to the tensile strength of the deposited metal, into which a good proportion of the nickel passes. To the nickel-coated rod is added asbestos in the form of an open spiral, and the flux is pressed into the spaces between the turns of asbestos. In electrodes for welding mild steel, the flux, we understand, need only be of a nature which enables it to act as a de-oxidiser; when, however, it is desired to produce electrodes to suit an alloy steel of known analysis, rare metals in powder form are employed, and these mix with the flux prior to extrusion. Such rare metals can be varied at will during manufacture to suit the analysis of the steel to be welded. During the welding operation the correct proportion of rare metals is imparted into the pool of molten metal at the arc, which is thus utilised as a miniature electric furnace to manufacture alloy steels.

Other Welding Plant.

A. W. P. also supply welding plant suitable for all conditions of supply. Special dynamos, which automatically give the necessary drop in volts—from the 60 V required to start an arc to the 25-30 required to maintain it—have also the features that the open circuit voltage can be adjusted from approximately 45 to 80 V and that the welding leads can be attached direct to the dynamo, the only essential separate apparatus being an ordinary shunt regulator.

The "Wagner" rubber-mounted motors, type RAR, distributed by WOLF AND MORGAN, LTD., of 66, Victoria Street, London, S.W.1, are claimed to be practically silent running. Originally designed for refrigeration, these machines fill the requirements of many other operations. They are available

Digitized by Google

for d.c. and single-phase a.c. supplies, in sizes ⅛, ¼ and ½ H.P. The d.c. motors are compound wound, and the a.c. are of the repulsion start induction type. The torque developed at starting is stated to be five times the full load torque, with about 2·6 times full load current. The maximum running torque and the pull-up torque are quoted at approximately 260% and 225% respectively. The motors are totally enclosed, have a continuous rating of 40 deg. C. and are fitted with bi-metal yarn packed bearings; they are of the double voltage type. Rubber bushings are backed up with steel on all surfaces, in order to hold the motors securely against forces acting from any direction. The saddle has a channel section, and its base is insulated from the main part of the motor by rubber bushings, which are soft enough to absorb the small remaining portion of mechanical vibration, while at the same time they are firm enough to retain rigidity. Metal thimbles have large surfaces to avoid cutting the rubber bushings, the four thimbles being clamped to the end plates by screws, thus securing the motor firmly in the saddle. Dynamic balancing of the rotor is effected while it revolves at running speed; solder is added at one end and lead rivets are inserted in punchings at the other; the rotor is of large diameter and skewed to ensure freedom from magnetic noise. Governor weights are rubber-cushioned to prevent clicking sound.

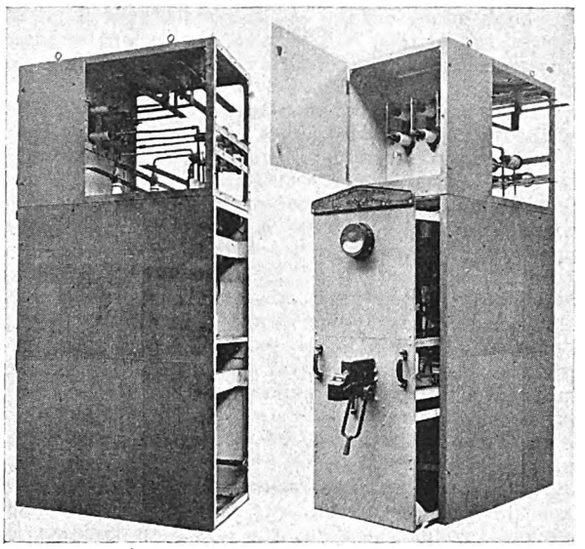
Those interested in battery charging will do well to take note of the equipment recently put on the market by NEWTONS OF TAUNTON, 6, Grape Street, Shaftesbury Avenue, London, W.C.2. The equipment is known as the Newton 8-hour taper charger, and operates on the constant potential system. It is capable of charging portable accumulators from 2 to 12 V. The generator is arranged for driving either by a universal motor or by belt. The principle of operation is that, if the initial voltage applied across the battery or batteries is correct, the increasing counter e.m.f. of the batteries will decrease the current flowing through them in an approximately suitable ratio to the proper values for current at any instant, provided the applied voltage is kept entirely constant. The constant voltages maintained across the busbars are respectively 16 V for charging 12 V units, and 8 V for charging 6 V units. Usually three busbars are supplied, 12 V being obtained across the outer pair and the middle bar acting as a neutral for 6 V charging. It is claimed that with the Newton method batteries in any condition can be safely charged. Much used, badly sulphated or new cells can be dealt with by using the current-limiting leads which are provided; the initial current thus being limited to a safe value.

The patented method of obtaining a constant potential involves the use of a magnetically insulated series field. The bottom pole piece of the bipolar machine is, it appears, split, and for each part a separate field coil is provided. One section of this subdivided pole is magnetically insulated by a special shield, on which the series turns are accommodated. The result is a compound wound machine of such a design that there is no possibility of a reversal of polarity.

Etching Equipment.

An electrical etcher is now being sold by the MARTINDALE ELECTRIC CO., LTD., of The Hyde, Hendon, London, N.W.9. This etching outfit is intended for making gauges, dies, gears, shafting and other articles made of iron or steel, and it is said to be much more satisfactory than the paraffin and acid method. The etcher consists of a transformer with three tops, ground wire and clamp for heavy pieces, contact plate for holding small parts, and handpiece with four writing points. The writing points are ordinary No. 8 copper wire, so that the cost of upkeep is negligible.

For certain conditions of operation it is essential to maintain continuity of supply, yet economic considerations may preclude the duplication of oil circuit breakers. To meet this need, FERGUSON PAILIN, LTD., of Bush House, Aldwych, London, W.C.2, have developed a special truck equipment which utilises an air break isolator to bypass the feeder oil circuit breaker and to maintain supply to the feeder via the bypass busbar and the bus coupler circuit. This scheme enables overhauling of the main switching equipment to be carried out in safety without shutting down, and still provides protection during the period of overhaul. This is accomplished by fitting over-current protection or over-current and leakage protection (if desired) on the bus coupler breaker, the trip coils or protective relay being energised from a multi-ratio current transformer in the same circuit. If the load on the feeders is well balanced, a single ratio current transformer can replace the multi-ratio transformer. As the switching equipment for the main circuit is on the movable portion, all the advantages of the truck principle are retained. For cleaning, inspection or repairs the truck can be withdrawn, after



Side front and rear views of the new truck type switchgear developed by Ferguson Pailin, Ltd.

the bypass circuit is completed, to a place set apart for the purpose.

From the photographs it will be seen that a standard truck cubicle is employed. The main busbars, however, are mounted with the bypass busbars in a detachable cubicle structure of steel, bolted on top of the truck housing. The bypass isolators, which are also located in this cubicle, are pole operated from the front, a hinged door facilitating access to them. The equipment is arranged for the usual methods of operation—either direct, manual, d.c., solenoid or motor control, with automatic reclosing features if desired. The truck is designed for two or three-phase systems up to 900 A at 11 000 V. It is 10 ft. 4¼ in. high, 3 ft. wide, 4 ft. 9 in. in depth, with an additional 5 ft. 0½ in. to withdraw the truck. The corresponding three-phase rupturing capacity is 100 000 kVA.

A new electric hat steamer for factory use is now being put on the market by the DOWSING RADIANT HEAT CO., LTD., of 93, Baker Street, London, W.1. The steamer, which is used for shaping felt hats, is small and compact, and is claimed to represent a great improvement over more elaborate and cumbrous equipment designed for the same purpose. It has two changeable steam-distributing parts: one consists of a pierced rose of large diameter with the support for the hat rising from the centre; the other is a wide-mouthed spout. The lower part of the steamer comprises what is essentially a specialised electric kettle. A gauge is provided to show the depth of water, so that there may be no chance of the container boiling dry. The loading is 800 W, with 2-heat control. Full heat is used for boiling up, while steam is maintained with a consumption at 400 W.

B.E.N. PATENTS, LTD. (92, Tottenham Court Road, London, W.1), have sent us particulars of the "Airline Lubrigun and Air Compressor Combination," which they are marketing in conjunction with TECALEMIT, LTD., who manufacture the Airline Lubrigun. The combination provides facilities both for high pressure greasing and for tyre inflation. It consists of a mobile unit, fitted with a ¾ H.P. a.c. or d.c. motor driving a compressor to give a maximum pressure of 150 lb., with a tank of 7 gals. capacity, tested to 300 lb. The compressor unit is equipped with the Airline Lubrigun, tyre hose and chuck. Control is by an electro-pneumatic switch, which limits the pressure range between 80 and 120 lb. The dimensions are: length 46 in., width 21 in., height 48 in. The weight is approximately 4 cwt.

New import duties upon goods imported into Australia include the following, under the British preferential tariff: On electric fittings and regulating and controlling apparatus, the new duty is 65% (formerly 33%); on ironclad moulded switches the duty is increased by 5s. each, or 20%; the basis of the duty on dynamo-electric machines is altered from 4% on 75 kW to £5 each on 125 H.P., plus 15s. per H.P. over 125 H.P., or 45% whichever is the higher.

BOOK REVIEWS.

High Voltage Cables. By L. Emanueli. (London: Chapman and Hall.) Pp. vii+107. 8s. 6d. net.

This book originated in a course of lectures given by the author in the lecture hall of the Institution of Electrical Engineers last winter under the ægis of the University of London.

In outline it consists of an examination of cable dielectrics from the successive standpoints of the properties of paper and impregnating compound, shape of field in single and three core cables, the physics of impregnation, and the mechanical and electrical properties of the complete cable. Important physical properties of paper used for cable manufacture are its porosity, absorption and dryness, and in Lecture I these questions are treated very fully. The usual ingredients of impregnating compounds, mineral oil and resin are examined separately and as mixtures, on various physical and electrical grounds, in the second lecture, and some very interesting relationships shown. Lecture III reviews briefly certain well established facts in connection with the magnitude of stresses in cables, while in Lecture IV the actions which take place during impregnation of a cable and the effect of subsequent thermal expansion of the various components are analysed in an instructive manner. The two or three pages on gas films are also useful. As cables cannot be manufactured and laid out straight, the effects of bending are all important, and the final lecture deals at some length with the problems involved.

Considering its admitted limitations, there is little to find fault with in the book, although one would have preferred to see the original and usually accepted term "S.L." retained for the type of three-core cable in which each core is separately lead covered, and the absence of an index is a serious omission from any book claiming the attention of busy engineers. Although Mr. Emanueli's lectures followed within a few weeks of those given by Mr. Dunsheath at University College on the same subject, and the latter has recently published a book (Pitman) with the same title as that of Mr. Emanueli, there is very little overlapping between the two. We can commend both to our readers.

Die Ausbreitung der Elektromagnetischen Wellen. By Dr. A. Sacklowski. (Berlin: Weidmann.) Pp. xii+129. 6 marks bound; 4.5 marks in paper covers.

This book is a survey of the literature dealing with the practical aspects of electromagnetic wave propagation, undertaken by the author at the instigation of the Heinrich-Hertz-Gesellschaft. The last 36 pages are devoted to a bibliography of 474 papers which have appeared in various British, American and Continental journals up to March, 1928; while the book is substantially a digest of the bibliography. The subject is treated in two main parts: the measurement of field strength (methods, results and conclusions) and theories of wave propagation. After sketching in each case the underlying theories and formulas, the author discusses—by reference to the work of the several authors—the methods adopted to substantiate or refute the theories, the measurements taken to promote further investigation, and the conclusions drawn. Methods of measuring field strength are followed by a summary of the conclusions drawn concerning solar and meteorological effects on field strength and its daily and yearly fluctuation. The theories are stated in ascending order of complexity: Without a conducting layer, and with a plane or a spherical earth; with a conducting (Heavyside) layer with and without neglect of the earth's magnetism. As a digest of the consensus of opinion this work should prove invaluable to workers with an intimate knowledge of the practice of wave transmission. The bibliography alone will prove a great help to investigators.

G. Parker Smith.

BOOKS RECEIVED.

"Kurzes Lehrbuch der Elektrotechnik." By Adolph Thomälen. (Berlin: Julius Springer.) Pp. viii+359. 14.50 marks.

"A Text-Book of Illumination." By W. Kunerth. (London: Chapman and Hall. x+269. 15s. net.

"Elements of Electrical Engineering: A Text-Book of Principles and Practice." By A. L. Cook. 2nd ed. (London: Chapman and Hall.) Pp. x+584. 20s. net.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Generator Interference with Wireless.

[To the Editor.]

Sir,—Can you suggest a remedy for the trouble that we are experiencing. We have just opened a power station in a large village in Dorset. Our generating plant consists of two semi-Diesel engines driving two high speed dynamos (1 100 r.p.m.). Our cable network is all overhead carrying 220 V d.c. The trouble is that whenever we run our generating sets we cause severe interference to all wireless receiving sets within range. Would condensers across the brushes help?—I am, etc.

Q.

January 6th.

[*As interference is probably due to radiation as a result of commutator sparking, the connecting of high capacity condensers across the brushes should be tried. We shall be glad if any of our readers who have satisfactorily eliminated trouble of this kind will give our correspondent the benefit of their experience.*—Ed.]

Propagandist and Technical Advertising.

[To the Editor.]

Sir,—Mr. Tyson's letter is interesting and I thank him for the compliment.

I agree entirely that the editorial columns of a journal are more valuable for propaganda than are the advertisement pages. It is a question, surely, of each man to his own trade. The 60 ampere service is part of the biggest problem which confronts electrical engineering in the future, i.e., distribution of electricity. I remember reading in one of the electrical weeklies the following editorial comment on an article which appeared elsewhere—

". . . points out that the time is fast approaching when the generating and transmission will be in fewer hands and most of its readers will be concerned only with distribution. We cannot agree with the remark that the distribution system is practically ignored by the Technical Press."

Yet I read in another electrical paper—

". . for distribution is one of the most important elements in modern electrical development and one of the most neglected as regards printed propaganda and diffusion of technical knowledge."

It would seem then that it may after all, be a case of the tail wagging the dog!—I am, etc.,

J. F. Simmons.

London.

January 4th.

[*This is a matter in regard to which no attempt at exact demarcation of frontiers could hope to win general approval, but the subject is of interest from several standpoints and we shall be glad to print the views of correspondents who may be courageous enough to try to draw a boundary line.*—Ed.]

[To the Editor.]

Sir,—My congratulations on your excellent first annual review number. All the articles are of great interest, but I would like to raise one point in connection with the review of technical advertising written by Mr. J. S. Simmons. The writer has not touched on the general tendency toward modernistic typography. I admit that his article is meant only as a general review of technical electrical advertising, but we see such appalling examples of the wrong use of typography and entire disregard on the part of some advertisers of the elementary principles of layout that I wonder if you could persuade Mr. Simmons to deal a little more fully with this subject.

I have in mind a double page advertisement which appeared quite recently in one of the electrical journals, where, to me, the attempt at modernistic treatment ended in the grotesque.—I am, etc.,

J. Arthur Dunville.

London, N.

January 6th.

NEWS IN BRIEF.

Temporary Wiring by Unskilled Persons—North-West Midlands Electricity Authority's Stock—Electrical Engineers Visit to Great Mountain Ash Colliery.

THE electrified extension of the Southern Railway linking Wimbledon and Sutton was opened for passenger traffic last Sunday.

Stoke-on-Trent Electricity Committee has been informed that temporary wiring has been erected by unskilled persons in order to give additional supply for purposes of a theatrical presentation. The consumer has been cautioned as to the danger of such procedure.

It is common for the iron frames of street boxes, in the course of wear and tear, to be above the level of the pavement, and thus constitute a potential cause of accident. The Westminster City Engineer has been instructed to confer with undertakers as to constructing street boxes without metal on the street surface.

Coventry Corporation proposes to instal internal telephones at the Council house, at an estimated cost of £715.

The "Daily Mail" Ideal Homes Exhibition will take place at Olympia, London, from March 24th to April 17th, inclusive.

Telephone subscribers in Moscow, were forbidden to telephone New Year greetings "in order not to overburden the system."

Blackburn Electricity Committee has decided to obtain tenders for the supply of cable, v.i.r. insulated wire, meters and lamps from manufacturers only.

At Tottenham Court Road station on January 3rd, an experiment was made with an escalator moving at 150 ft. a minute instead of the usual 90 ft. a minute.

The Western Union, Commercial, and French Cable Companies, state that 600 miles of new cable, costing over $500 000, will be necessary to mend the cable breaks caused by the earthquake off Cape Breton Island on November 18th.

During the present week £886 000 of the North-West Midlands Joint Electricity Authority's 5% stock, 1950–70, has been offered for subscription at 98½%. The stock is repayable on July 1st, 1970, but the authority reserves the right to repay the whole amount at par on or after July 1st, 1950.

Leeds Improvement Committee has received reports with respect to a competition amongst students at the City of Leeds College of Art for designs for lamp standards proposed to be erected in the Headrow. Premiums awarded are as follows:—1st, £8, Mr. J. L. Crowther; 2nd, £4, Mr. D. B. Smith; and 3rd, £3, Mr. E. Shepherd. Messrs. G. H. Foggitt and Mr. G. E. Carrier acted as adjudicators.

Catalogues of the British Industries Fair are already being sent to 10 000 business men in Europe, North America, South Africa, and the eastern coast of South America. The catalogues contain descriptions of the exhibits of 1 800 British manufacturers, with indexes in nine languages. The Fair will take place at Olympia, London, and Castle Bromwich, Birmingham, from February 17th to February 28th.

At a meeting of the Incorporation Society of British Advertisers, Engineering Section, at the Victoria Hotel, Deansgate, Manchester, on January 17th, at 2.30 p.m., Mr. A. H. Angers, general secretary, will speak on "Unnecessary Advertising Snags," dealing particularly with the negotiations in reference to standardisation of page size in the technical Press and the provision of circulation data. Non-members will be welcomed. Mr. J. Taffs, publicity manager of the English Electric Co., will preside.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated January 10th, 1880, the United States Lighthouse Board was asking for an appropriation of $50 000 to test the merits of electric light for lighthouse purposes.*

Illumination of London Bridge by electricity was being discussed.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of January 13th, 1905, reported the formation of an association of telephone subscribers in Paris to bring pressure on the P.T.T. administration to improve the service.*

An agreement had just been signed between the Italian Government and the Marconi Co. for the construction of a radio station at Coltano to communicate with Great Britain, the Netherlands, Eritrea and other countries.

* * *

TEN years ago THE ELECTRICIAN *of January 9th, 1920, remarked that there was already evidence that many electric supply undertakings would take advantage of the provisions of the Electricity (Supply) Act in order to form joint electricity boards.*

Hydro-electric schemes in the Grampians and on Dartmoor were being projected.

Chelmsford Corporation has instructed the Borough Engineer to provide for the use of electric power in his schemes relating to the sewage and water supply of Galleywood.

Mr. J. H. Parker, who recently resigned his appointment as borough electrical engineer of West Hartlepool, delivered a lecture on "The Future of Electrical Supplies" to the West Hartlepool Conservative Party Study Circle recently.

Under the auspices of the London Technical Group of the E.P.E.A., Miss Caroline Haslett, director of the Electrical Association for Women, lectured at the Institution of Electrical Engineers, London, on Tuesday on "The Place of Women in the Electrical Industry."

The Radio Corporation reports that its Transatlantic business has increased by half since the earthquake off Cape Breton Island in November.

Cable communication to North America has been restored on the Imperial cable between Porthcurnow, Cornwall, and Halifax, Nova Scotia.

Chester Corporation has decided to appoint a superintendent of the electricity showrooms to fill the vacancy caused by the resignation of Mr. W. H. Millatt.

Wakefield Corporation has instructed the Electrical Engineer in conjunction with the City Surveyor to prepare a scheme for the renewal of the lighting and heating installations at the town hall.

Imperial and International Communications, Ltd., announces that over 121 000 telegrams of Christmas and New Year greetings were dealt with in the United Kingdom at special reduced rates.

In a recent address to the Publicity Club of Glasgow, Mr. W. Imrie Smith described electric lighting of to-day as one of the greatest assets in all forms of publicity work. He said the range of electric lighting in advertising was an extensive one, culminating in the blatant sky sign which put its message across with a considerable degree of punch. The attraction of the bright light was deep-rooted in everyone, and the display man was finding that display lighting was one of the cheapest and best forms of advertising.

An Order in Council entitled the Merchandise Marks (Imported Goods) No. 5 Order, 1929, was made on December 17th. It requires, *inter alia*, imported scientific glassware and domestic, fancy and illuminating glassware to bear an indication of origin as from June 17th, 1930. The Order will apply to the goods at the time of sale and exposure for sale. In the case of scientific glassware it will also apply at the time of importation.

Members of the South Wales Branch of the Association of Mining Electrical Engineers have been invited to visit the Great Mountain Ash Colliery, Tumble, to-morrow (January 11th). A paper on "Some Considerations *re* Power Costs," will be read by Mr. S. T. Richards at a subsequent meeting at Swansea Royal Metal Exchange. The annual dinner will take place on January 18th. Particulars from Mr. H. J. Norton, hon. sec., 53/55, Tredegar Street, Cardiff.

Applications are invited for the following appointments: Senior technical assistant, with a knowledge of low power electrical machinery, in the Admiralty Technical Pool; mains engineer at Southend; installation superintendent in Barking U.D.C. electricity department; lady showroom assistant and demonstrator in Fulham electricity department; general manager of Johannesburg municipal electricity department; engineer, with mechanical and electrical experience, for Admiralty cordite works.

Digitized by Google

PERSONAL.

MR. W. J. Wiles has resigned from the board of S. G. Leach and Co., Ltd., and joined the staff of Philips Lamps, Ltd.

Mr. and Mrs. W. E. Warrilow announce that they are now resident in their all-electric home, at Amber Way, Nancy Down, Oxhey, Herts. Telephone: Watford 1092.

Canterbury City Council has appointed Mr. Frank Eustace Lewis, the present assistant engineer, as city electrical engineer in succession to the late Mr. C. A. Blascheck.

Mr. F. Rostron, instrument sales manager of Ferranti, Ltd., has been presented with a chiming clock and an electric reading lamp on the occasion of his marriage.

It is understood that the Northern Ireland Government has secured the services of Mr. J. M. Kennedy as consultant to the Ministry of Commerce in connection with electrical development in Northern Ireland.

Mr. A. MacLean, who has been appointed chief assistant to the Sunderland borough electrical engineer, is a partner in the Newcastle firm of Mountain, Wood and MacLean, consulting engineers, who had charge of the electrical installation work at the North-East Coast Exhibition. Mr. MacLean was with the Newcastle-upon-Tyne Electric Supply Co. for nine years.

Mr. R. A. Chattock, who as already announced is retiring from the position of chief electrical engineer of the Birmingham electric supply department, which office he has held for over 25 years, was entertained to a complimentary dinner by the staff of the department on January 3rd. Mr. E. J. Jennings was in the chair, and over two hundred were present. During the evening Mr. Chattock was presented with his portrait in oils, painted by Mr. Bernard Munns, the presentation being made by Mr. F. Forrest.

It has been the custom for many years for the staff of the electricity works of Farnworth U.D.C. to meet the engineer and manager on New Year's Eve, and this year, Mr. A. J. Hutchinson and his wife were jointly presented by the staff with a cut glass rose bowl, and fruit basket, as a memento of the 25 years' service of the former with the council, two years as station superintendent, three years as chief assistant engineer to Mr. R. B. Leach, and 20 years as chief electrical engineer and general manager.

Mr. W. S. Naylor, who has been appointed chairman of the board of directors of the Chloride Electrical Storage Co., Ltd., in succession to the late Mr. William Bannister, has seen the growth of the company from a comparatively small concern to its present dimensions. Mr. Naylor received his early technical training at Finsbury College, where he came under the influence of the late Professor Sylvanus P. Thompson. In 1902 he was appointed assistant manager of the Chloride Co., and four years later became general manager, while in 1921 he joined the board of directors. (See page 49.)

Obituary.

MR. JAMES NICHOLLS OSBORNE, on December 28th, a director of the Paignton Electric Light Co.

MR. JOSEPH WILLIAM WILLMOTE, aged 80 years. He joined the engineering branch of the Electric and International Telegraph Co. in 1862, and had numerous inventions to his credit, including a quick-break electric light switch. He retired in 1909 from the position of Controller of Factories at the General Post Office.

PROFESSOR A. A. MICHELSON, aged 77 years. His experiments in physics were concerned especially with the interference of light and its exact measurement. It is claimed that Einstein's theory was based on the result of an experiment which Michelson made at Cleveland, Ohio, in the 'eighties in collaboration with the late Professor E. W. Morley. He was awarded in 1907 the Nobel Prize and the Copley Medal of the Royal Society.

MR. OTTO NUSSBAUMER, aged, 54 years. Twenty-five years ago he constructed an apparatus without connecting wires which could receive and make audible voices and music over short distances. Unable to obtain sufficient financial support, he abandoned experiments, and present-day wireless telephony owes no direct debt to him, as it is based on a different system. Two years before the first crystal set was put on the market Nussbaumer employed iron oxide crystals for a small receiving set, but he did not realise the importance of his discovery of the crystal's function, and took no step to make public his discoveries. Recogntion was first accorded him last year, when Professor Ettenreich, of Graz, placed his achievements on record.

BUSINESS ITEMS.

THE RELAY AUTOMATIC TELEPHONE CO., LTD., Relay House, Streatham Hill, London, S.W.2, has received an order from the Carlton Hotel, London, to equip the building throughout with a private automatic telephone system.

The MARCONIPHONE CO., LTD., 210, Tottenham Court Road, London, W.1, announces that it has decided that in future it will not supply any of its products to co-operative societies, and is addressing a communication to its wholesalers and retailers accordingly.

An agent in Eindhoven, Holland, desires to secure the representation of British manufacturers of wireless sets and parts, etc. The Department of Overseas Trade has further details. (Reference No. 22.)

The ENGINEERING AND LIGHTING EQUIPMENT CO., LTD., Sphere Works, St. Albans, Herts, announces the acquisition of the Pinnacle Switchgear and Fuse Co., of Weybridge, and payment of all outstanding accounts for goods sold should be made to them in due course, and payment for all goods delivered only on or after November 14th last will be made by them on their usual paydays—10th of each month. Orders and inquiries will be dealt with both from Weybridge and St. Albans in future, and the range of articles manufactured by the two works will be increased.

In view of the recent introduction in this country of golf clubs with steel shafts, WILD-BARFIELD ELECTRIC FURNACES, LTD., Elecfurn Works, North Road, London, N.7, point out that the leading American firms of steel golf shaft makers have for some time past been hardening these shafts in electric furnaces designed by them, and since the legalisation of the shafts in Great Britain, orders have been received for similar equipments for making in this country. These furnaces are of a very special design, and in addition to a new form of automatic control in regard to temperatuie, etc., there is also an automatic quenching device.

H.M. Trade Commissioner in New Zealand, Mr. L. A. Paish, reports that constant reference is being made by New Zealand firms to the catalogues of British manufacturers in his office, and many instances have arisen where connections with British firms have been opened up by this means. He would like to receive catalogues from British firms manufacturing certain lines, including electric refrigerating plant for domestic use, electric hand torches, electric household clothes- and dish-washing apparatus, wireless receiving sets, etc. The catalogues should be forwarded, postage paid, to His Majesty's Trade Commissioner, P.O. Box 369, Wellington.

The Department of Overseas Trade is informed that preparations are being made to hold a Radio Exhibition at Tokyo from March 20th to April 18th, 1930. The Department has received from the Commercial Counsellor a limited number of copies of a preliminary circular letter and summary of the scope of the exhibition, issued by the managing director of the broadcasting station, which it is considered may be of interest to exporters of apparatus used in connection with wireless transmission of sound, television, photography, cinematography, etc. The exhibition will have the support of the Japanese Ministry of Communications and it is hoped to obtain also the support of the Ministry of Education. The Japanese Customs have agreed that imported exhibits shall be admitted free of duty and without deposit against re-export.

Since advising us of their activities during 1929, the ENGLISH ELECTRIC CO., LTD., have received confirmation of two further important orders, both of which emanate from the Canadian market. The first order is for an 18 000 H.P. hydro-electric double overhung impulse turbine and 15 000 kVA 6 600 V, 60 cycle alternator, the speed of the unit being 300 r.p.m. and the effective head 1 010 feet. The set will be designed for an overspeed of 555 r.p.m. and is complete with two main valves of their cylindrical balanced type and a 250 kW auxiliary motor-generator set. The two runner wheels are overhung on the two ends of the extended generator shaft, the general arrangement being somewhat similar to that adopted for the units supplied by this company for the Bhira power house of the Tata Power Co. The unit has been ordered by the Vancouver Island Power Company through the English Electric Co. of Canada and will be installed in a power station on the Jordan River, British Columbia. The other order consists of a 6 000 kVA 6 600 V 60 cycles, 450 r.p.m. vertical shaft generator for water turbine drive for the Power Corporation of Canada for installation at Falls River power station near Prince Rupert, British Columbia. This machine has a direct coupled exciter and is designed for an overspeed of 900 r.p.m.

THEATRE LIGHTING.

Electrical Equipment of New Wellington, N.Z. Theatre.

WHILE London and the provinces have been recently adding considerably to the ramifications of theatre-land, the Dominions have not been idle. The new "Majestic" theatre in Willis Street, Wellington, is one of the latest additions to the theatre world of New Zealand and is in the circuit owned by Messrs. Fuller-Hayward, Ltd. Nearly 70 000 yards of "Henley" cables were used for the electrification, ranging from 1·044 to 37·083, and over 1 200 yards of flexible cords of the same manufacture. The outside under-verandah lighting consists of nine 5-light fittings, each with five 75 W "Argenta" lamps, and the floodlighting was done with three "Westinghouse" type C.A. 14 chromilite floodlights each with a 500 W lamp and three type C.A. 16 chromilite floodlights each with a 1 000 W lamp.

Main Entrance Showcases.

In the main entrance eight showcases are provided along each side, each being lit with two "Holophane" reflectors with 150 W lamps. The main lighting is concealed above the showcases and consists of 64 (32 on each side) asbestos covered reflectors of the same manufacture and 150 W lamps. Colour screens are provided on the reflectors to allow of a wide choice of colour schemes. Each of the four standards along each side is fitted with a 100 W lamp. The lighting of the entrance foyer is concealed in a specially built cove around the ceiling, consisting of 178 reflectors with 100 W lamps and colour screens. One of the features is the specially designed plaque at the lift which is lighted by a spotlight. The lighting under the circle consists of thirteen 2-light enclosed fittings with 75 W lamps, and there is a small dome in the centre lit with 133 natural colour lamps in red, blue, green and amber, controlled from the main dimmer. The main dome is 52 ft. in diameter and has two specially built coves—the inner has 180 reflectors and the outer has 184. The sunburst over the stage is lit with 100 W natural colour lamps at the bottom and three rows totalling 126 reflectors. The proscenium arch is lit with 120 reflector units and a combination of colours and dimmer control gives a most pleasing effect. The curtain changes colour continually, as the footlights are operated from a special stage dimmer. On the stage are also three rows of battens, each 50 ft. long, equipped with 982 reflectors, and 200 W lamps and colour screens are provided. The balconettes (at either side) are lit with 12 reflectors fitted with colour screens. The orchestra can be flooded in colour from 10 to 1 000 W floods mounted behind the proscenium arch.

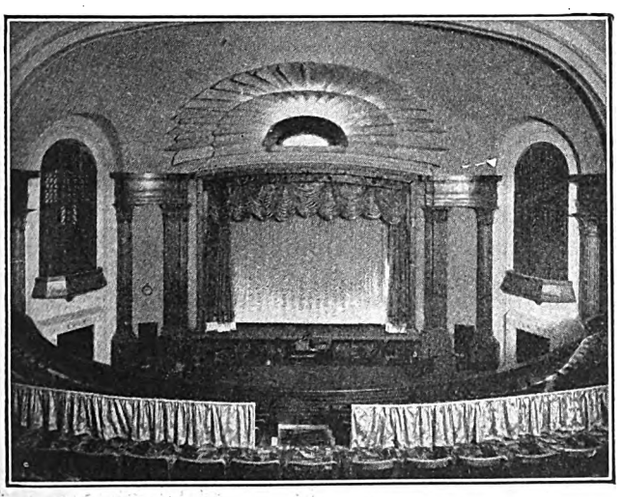
Glass Dancing Floor.

The tea lounge and cabaret are provided with a glass floor for dancing, lit from below with 109 colour screen reflectors, amber lamps otherwise used throughout. The whole of the auditorium lighting is controlled from a Ward Leonard dimmer in the operator's box, with a total capacity of 110 500 W. A separate and similar dimmer is installed on the stage with a capacity of 46 200 W.

A stand-by plant was provided, consisting of 36-42 H.P. twin cylinder, cold starting, direct injection crude oil engine direct connected to a 25 kW shunt wound 230 V 475 r.p.m. generator. This provides emergency lighting and enables the performance to be carried on in the event of failure of the main supply.

The lighting scheme was designed and the whole electrical installation carried out by Turnbull and Jones, Ltd., who manufactured the bulk of the luminaires, which comprised 36 chandeliers, 4 newels, 8 standards, 32 brackets, 150 feet stage battens, 40 feet footlight and 2 large imitation fires.

Some idea of the elaborate arrangements of the installation and the effective lighting schemes which have been introduced may be gathered from the photographs reproduced below, showing the stage lighting, the main dome and the stairway leading to the circle.



THE MAJESTIC THEATRE.

THESE views of the Majestic Theatre, the latest to be opened at Wellington, N.Z., show the effective lighting schemes which have been installed. The wiring of the building involved the use of nearly 70 000 yards of "Henley" cables and these pictures show some of the more striking of the lighting arrangements adopted. On the left is the stage, with its changing-colour curtain, and below, are, left and right, the lighting scheme for the stairway leading to the circle, and the main dome of the building floodlighted by over three hundred reflector units.

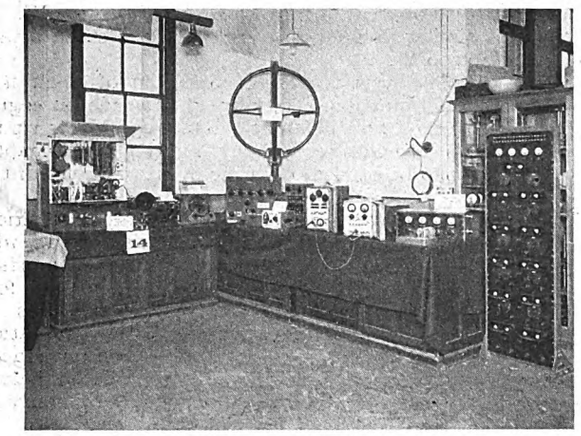
BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

ARMY CONTRACTS.—It is announced that tenders are invited from time to time for various goods, including cables, electrical plant, electrical and wireless stores, scientific instruments, etc., and manufacturers who are not already on the War Office list of tenderers may apply to the Director of Army Contracts, Caxton House (West), Tothill Street, Westminster, S.W.1, for form No. 1, on which formal application for inclusion on the list of tenderers may be made. Firms who wish to tender for the purchase of surplus machinery, scientific instruments, electrical and wireless stores, etc., should also apply to the director, at the same address.



THE stand of Marconi's Wireless Telegraph Co., Ltd., at the Physical Society's and Optical Society's Exhibition, which was held at the Imperial College of Science, London, during this week. A brief review of the exhibition is given on pages 34 and 35.

WEST RIDING EDUCATION AUTHORITY.—Electric light installation in Lofthouse Council School, Rothwell. Specification and plan from Mr. Percy Beaumont, West Riding Education Office, 8, St. John's North, Wakefield.

DUMFRIES CORPORATION, January 11th.—Electrical work in connection with erection of 32 houses at Milldamhead and Noblehill. Specifications from the burgh surveyor, Mr. John Barker.

CAMBERWELL (LONDON) BOROUGH COUNCIL, January 13th.—Maintenance of electric lighting, heating and power installations, telephones, etc. (tender form H), and supply of electric lamps (form S). Forms of tender from the Borough Engineer.

DEWSBURY CORPORATION, January 13th.—Supply and erection of rotary convertor plant (1 500 kW and 500 kW). Specification, etc., from Mr. R. W. Grubb, borough electrical engineer, Bradford Road, Dewsbury.

ISLE OF MAN GOVERNMENT PROPERTY TRUSTEES, January 18th.—Electrical installation in Gronk Ruagh Hospital, Ramsey. Specifications from the Government Office, Douglas; deposit £1 1s.

STOKE AND WOLSTANTON GUARDIANS, January 13th.—Electric light and power wiring and fittings, in connection with new nurses' home, London Road Institution, Stoke-on-Trent. Specification, etc., from Mr. T. Wood, clerk to the Guardians, Union Offices, Stoke-on-Trent; deposit £3.

CLUTTON RURAL DISTRICT COUNCIL, January 14th–29th.—Electric light installations in 55 houses. Specifications, etc., from the engineer, Mr. J. Wayne-Morgan, 6, Church Road, Whitchurch, Cardiff, until January 14th.

HULL CORPORATION, January 14th.—Electric light installation at the Colony for Mental Defectives, Tilworth Grange, Sutton. Plans and specifications from Mr. D. Harvey, city architect, Guildhall, Hull; deposit £1 1s.

LONDON COUNTY COUNCIL, January 14th.—Electric light installation at the superintendent's house, Abbey Mills Pumping Station, Stratford. Specification, etc., from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £1.

NORTHERN IRELAND GOVERNMENT, January 14th.—Twelve months' electrical supplies to the various Government establishments. Forms of tender and conditions of contract from the offices of the Ministry of Finance (Room 34), 15, Donegall Square West, Belfast; deposit £1.

ORSETT RURAL DISTRICT COUNCIL, January 14th.—Supply and installation of five sewage pumps with electric motors, float controls and switchgear. Specification and further information can be obtained from Mr. G. F. Andrassy, engineer, Council Offices, Palmer's Avenue, Grays, Essex, until January 14th.

DUNDEE CORPORATION, January 15th.—Supply of two 300 kVA outdoor type transformers and one 200 kVA outdoor type transformer. Specifications from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee.

BARMING HEATH MENTAL HOSPITAL, MAIDSTONE, January 16th.—Electrical installation, for lighting, heating, etc. Electrical energy will be supplied from the mains of Maidstone Corporation. Specification, etc., from Mr. E. E. Hoadley, Corporation Electricity Works, Maidstone; deposit £2 2s.

BIRMINGHAM GUARDIANS, January 16th.—Electrically-driven hydro-extractor, with motor and accessories; electrically driven glad iron, with motor and accessories, etc. Further particulars from the master, Mr. E. P. Hill, Erdington House, Birmingham.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 17th.—One year's supply of cables, electricity meters, cable terminal and other boxes, switches, wires, lamps and sundries. Specification, etc., from the Town Clerk, Municipal Buildings, Upper Street, London, N.1.

CHELTENHAM CORPORATION, January 18th.—Supply of electric light fittings, etc., for one year. Tender forms from Mr. J. S. Pickering, borough engineer. Municipal Offices, Cheltenham.

MANCHESTER WATERWORKS COMMITTEE, January 18th.—Supply and erection at Haweswater, Westmorland, of three 275 H.P. oil engines, direct coupled to three 200 kW d.c. generators, etc. Specifications, etc., from the Engineer, Waterworks Offices, Town Hall, Manchester; deposit £2 2s.

WEST RIDING COUNTY COUNCIL, January 18th.—Electric light installation in the mixed department of Riveton Park Council School. Specifications from Mr. A. Rayner, 151, Cross Hill, Ecclesfield.

Switchgear.

CENTRAL ELECTRICITY BOARD, January 20th.—Supply and erection of 3·3 kV, 6·6 kV, and 11 kV switchgear, for connecting the Board's supply to undertakers' busbars. Specification (N.W.E.—G.S.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

BELFAST GUARDIANS, January 21st.—Electric lighting installation in connection with alterations and additions to nurses' home at Belfast Infirmary. Specification can be seen and form of tender obtained on application to Mr. R. H. Wilson, clerk to the Guardians.

METROPOLITAN WATER BOARD, January 21st.—Supply and erection of four steam turbines, with pumps, and two electric generators, for Surbiton pumping station. Specification, etc., from the Chief Engineer (Room 173), 173, Rosebery Avenue, London, E.C.1; deposit £3 3s.

BATH CORPORATION, January 22nd.—Supply of 60 000 lb. boiler, 7 000 kW turbo-alternator, and e.h.t., h.t. and l.t. cables required during 12 months. Specifications, etc., from Mr. J. W. Spark, city electrical engineer, 7, Dorchester Street, Bath; deposit £2 2s.

HULL CORPORATION, January 22nd.—Supply and fixing of two 9 in. centrifugal pumps, with a.c. motors, switchgear, piping, etc. Forms of tender and other particulars from Mr. T. Thomas, city engineer, Guildhall, Hull; deposit, £1.

Digitized by Google

GRIMSBY CORPORATION, January 23rd.—Manufacture, supply and erection of 10 000 kW three-phase turbo-alternator, with condensing plant. Specification, etc., from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby; deposit £2 2s.

LIVERPOOL CORPORATION, January 23rd.—Twelve months' supply of C.L.I. wrought-iron standards, brackets, etc., and No. C.L.2 c.i. lamp columns, and malleable c.i. pitching irons, etc. Tender forms from the City Lighting Engineer, 17, Highfield Street, Liverpool. State name and number of schedule for which form is desired.

LIVERPOOL CORPORATION, January 23rd.—Twelve months' supply of materials to the electric supply department, including cables, compounds and tapes (Form E.S.1), insulated cables (E.S.2), meters (E.S.3), incandescent lamps (E.S.5), a.c. motors and starting gear (E.S.7), electric cookers and kettles (E.S.11), etc. Tender forms from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

COMMISSIONERS OF H.M. WORKS, January 24th.—Erection of submarine cable jetty at Dover. Specification, form of contract, etc., from Contracts Branch, King Charles Street, London, S.W.1; deposit, £1 1s.

SLOUGH URBAN DISTRICT COUNCIL, January 24th.—Installation of two sets of motor-driven centrifugal pumps. Particulars and forms of tender from Mr. A. Bromley, water engineer, William Street, Slough.

NORWICH CORPORATION, January 28th.—Supply and erection of refrigerating plant at the Isolation Hospital. Specification, etc., from Mr. J. S. Bullough, city engineer, Guildhall, Norwich.

CENTRAL ELECTRICITY BOARD, February 1st.—Supply and erection of 33 000 V overhead transmission lines in South-East England. Specification (No. S.E.E.—S.L. 3) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BLOEMFONTEIN MUNICIPALITY, January 10th.—Supply of automatic electric traffic signals (contract No. 5). (Reference B.X. 5 887.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 14th.—Two air compressors (capacity not less than 800 cu. ft. of free air per min.), and two electric motors. (Reference A.X. 8 784.)

POSTMASTER-GENERAL'S DEPARTMENT, January 14th.—Supply of copper, bronze, tinned copper and cadmium copper jointing sleeves (schedule No. C.547). (Reference B.X. 5 997.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of ringing motor-generator sets, for automatic telephone exchanges. (Reference B.X. 5 839.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of telephone indicators (schedule C. 518). (Reference B.X. 5 822.)

TENERIFFE (CANARY ISLANDS) MUNICIPALITY, January 14th.—Supply of tramcars, rails and tramway equipment. (Reference A.X. 8 872.)

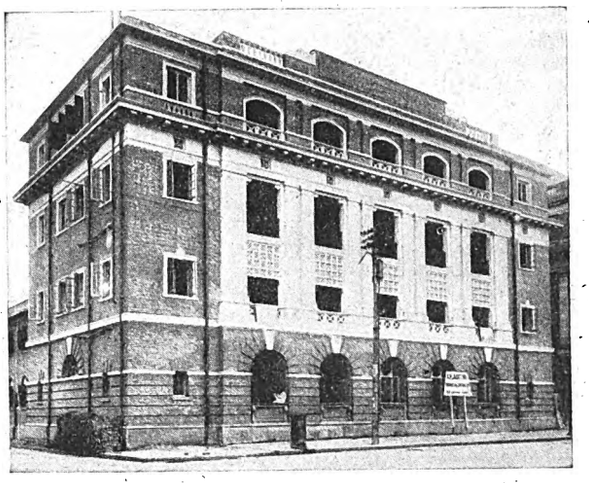
BELGIAN POSTS AND TELEGRAPHS, January 15th.—Supply 105 km. of cotton covered wire, 200 km. of corded two conductor wire, 1 200 km. of enamelled two and three conductor wires, 2 km. of 63-conductor telephone cable, and 50 km. of silk and cotton covered enamelled wire. Cahier des Charges Special, No. 3 456 (fr. 6¼) from the offices of the department, La Salle Madeleine, Brussels.

CAPE TOWN MUNICIPALITY, January 15th.—Supply of direct-coupled, electric motor driven, centrifugal pump for sewage works (specification No. 475/1 829). (Reference A.X. 8 836.)

COPENHAGEN MUNICIPALITY, January 15th.—Supply of two 6 000 V h.t. switchgear installations. (Reference B.X. 6 004.)

INDIA STORE DEPARTMENT, January 15th.—Supply of wood separators for train-lighting cells. Form of tender (5s.) from the Director-General, Belvedere Road, Lambeth, London, S.E.1.

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)



THE new police building at Lall Bazaar, Calcutta, where the electrical installation comprises 311 light and 115 fan points and three electrically driven centrifugal pumps for water supply. From the 440 V main service boards "Henley Wiring" sub-mains are run to ironclad H.O. type distribution boards supplied by the General Electric Co. (India), Ltd. As the building is in the same compound as other police quarters, the water pumping arrangements have been rearranged and centralised, two 10 000 gall. per hour filtered water pumps being supplied by Mather and Platt, Ltd., for use with an unfiltered water 3 000 gall. per hour pump by Worthington Simpon, Ltd. The electrical work was carried out by Geo. Rosamond and Co., to the specification of the P.W.D., under Mr. J. D. A. Vincent, executive engineer, Electrical Division.

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943). (Reference B.X. 5 879.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 16th.—Supply of telegraph material, comprising g.i. tubular cross arms, copper tapes and binders, galvanised steel spindles, etc. (Reference A.X. 8 990).

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 16th.—Supply of crude oil engine driven electric generating sets (tender No. 1 589). (Reference B.X. 5 926.)

WAITEMATA (N.Z.) ELECTRIC POWER BOARD, January 18th.—Supply of three-phase 11 000 V 50 cycle transformers. (Reference B.X. 6 027).

INDIA STORE DEPARTMENT, January 21st.—Supply of 43 205 battery cells, etc. Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 21st.—Four electric motor driven ventilating fans. (Reference A.K. 8 857.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 21st.—Spare parts for automatic telephones. (Reference B.X. 5 917.)

SOUTH INDIAN RAILWAY CO., January 24th.—Supply of cables and accessories, in connection with Madras improvements. Specifications and forms of tender (£1, not returnable) from the Company's offices, 91, Petty France, Westminster, S.W.1.

NEW ZEALAND POSTS AND TELEGRAPHS, January 27th.—Supply of breastplate transmitters. (Reference B.X. 5 956.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 28th.—Supply of condensers. (No. P. and T. 151/2 087). (Reference B.X. 6 031.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates (Schedule No. C. 533). (Reference B.X. 5 899.)

DUNEDIN DRAINAGE AND SEWERAGE BOARD, February 1st.—Supply of two centrifugal or propeller pumps, with electric

Digitized by Google

motors and accessories (contract No. 737). (Reference A.X. 8 961.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct-coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 3rd.—Supply of protector blocks (carbon and porcelain). (Reference B.X. 5 948.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

INDIA STORE DEPARTMENT, February 5th.—Supply of 30 000 wood separators for train lighting cells. Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW ZEALAND POSTS AND TELEGRAPHS, February 5th.—Supply and delivery of indication alarm fuses. (Reference B.X. 5 947.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3.) (Reference B.X. 5 844.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T., 151/2 025). (Reference B.X. 5 955.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 13th.—Supply of electric tube butt welding set. (Reference B.X. 6 005).

LOUIS TRICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of distribution system (poles, conductors, transformers, meters, sub-station equipment, etc). (Reference B.X. 6 003).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of switchboard plugs (schedule C. 548). (Reference B.X. 5 998.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttleton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

BARNSTAPLE T.C.—Rowland Bros., steel gulley cart, £9 17s. 6d.

BARKING URBAN DISTRICT COUNCIL.—A.C.E.C., supply of cable, £1 800.

BOOTH STEAMSHIP CO., LTD.—Siemens Electric Lamps and Supplies, Ltd., supply of Siemens electric lamps for 12 months.

BOMBAY CORPORATION.—International General Electric Co., Inc., supply of an electric refrigerator, for medical college, Rs. 852.

BOOTH STEAMSHIP CO., LTD.—Siemens Electric Lamps and Supplies, Ltd., for supply of Siemens electric lamps for 12 months.

ILFORD CORPORATION.—Brush Electrical Engineering Co., Ltd., supply of three tramcar bodies, £1 270 each (recommended).

DONCASTER CORPORATION.—Building and Colliery Supply Co., Ltd., wiring 180 houses at intake for electric light, £742 10s.

HULL CORPORATION.—Ateliers de Constructions Electrique, supply of cable, for telephones department, £494 3s. 8d. (Recommended.)

DUMFRIES CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., main switchgear, etc., for the new turbo-alternator plant, £533 12s. 6d.

MIDLOTHIAN EDUCATION COMMITTEE.—Inveresk Electrical Engineering Co., Ltd., electrical installation in new Grammar School, Musselburgh.

WEST LOTHIAN EDUCATION COMMITTEE.—Fraser and Borthwick, Ltd., electric lighting installation in extensions at the Academy, Linlithgow.

POWELL'S RIVER CO. (BRITISH COLUMBIA).—S. Cameron Co., Ltd., equipment of first section of 17 000 H.P. hydro-electric station on Lois river.

LONDON COUNTY COUNCIL.—Dorman, Long and Co., Ltd., supply of tramway rails and fishplates during 1930-31, £53 896. Also tendered : Cargo Fleet Iron Co., Ltd., £54 828.

LONDON COUNTY COUNCIL.—Frodingham Iron and Steel Co., Ltd., supply of tramway conductor rails during 1930-31, £7 232. Also tendered : Dorman, Long and Co., Ltd., £7 600.

ROTHERHAM CORPORATION.—Hogan and Wardrop, supply of cable, £6 410 ; A. Reyrolle and Co., Ltd., supply of 5 h.t. switches, £128 each, plus £9 11s. 3d. per switch for automatic control.

BIRMINGHAM B.C.—Brightside Foundry and Engineering Co., Ltd., new fire main, heating, domestic and cold water services at Western Road House, £7 766 ; Reynolds and Bradwell, electric work, £1 739 2s.

UXBRIDGE URBAN DISTRICT COUNCIL.—Blackstone and Co., Ltd., 38 to 43 B.H.P. oil engine, to drive centrifugal pump, three electrically-driven vertical spindle pumps, etc., for Harefield pumping station, £1 897.

LEEDS CORPORATION.—English Electric Co., Ltd., supply of sub-station switchgear, £6 338 8s. ; Relay Automatic Telephone Co., Ltd., installation of automatic internal telephone system at the health department, £358 6s.

CAPE TOWN CORPORATION.—Auto Electric Supply (Cape), Ltd., supply of decorative lamps for the pavilions and pier, £162 10s. ; South African General Electric Co., Ltd., supply of motor-generator set, for bioscope at pavilion, £116.

H.M. OFFICE OF WORKS, ETC.—T. Glark and Co., Ltd., electric wiring at East Malling fruit storage testing station, and supply of ironclad switchgear, New Houses of Parliament, Stormont, Belfast ; Gaillard, Robinson and Co., electric light re-wiring, Bethnal Green (London) Museum.

GLASGOW CORPORATION.—John Thompson (Wolverhampton), Ltd., supply of six new boilers for the tramway department's Pinkerton power station, £90 327. After consultation with specialists, Municipal Transport Committee has reaffirmed recommendation to accept this tender.

GENERAL POST OFFICE.—Alton Battery Co., Ltd., enlargement of batteries, Fenny Stratford telephone repeater station ; Siemens Bros. and Co., Ltd., supply, drawing-in, etc , of cable, London-Gallows Corner ; Standard Telephone and Cables, Ltd., telephone exchange equipment, Wembley.

METROPOLITAN RAILWAY.—Westinghouse Brake and Saxby Signal Co., Ltd., re-signalling of line from Uxbridge to Rayners Lane. Contract includes supply and installation of 22 main colour light signals, fog repeater signals, 22 electric train stops, 50 condenser-fed track circuits, illuminated diagrams, a.c. relays, lever locks, apparatus cases, cable, line wire, insulation, etc.

BIRMINGHAM CORPORATION.—Etna Lighting and Heating Co., Ltd., electric lighting at Little Bromwich Fever Hospital ; R. H. Newton, extension of electric lighting system at Hartfield Crescent school ; Pritchett and Gold and E. P. S., Ltd., renewal of batteries at Salterley Grange sanatorium ; L. Scrutton, electric light installation at Hockley Welfare Centre ; Ellis and Ward, Ltd., installation electric lighting apparatus, at Gunter Road school ; George Ellison, Ltd., supply of switchgear ; Harland Engineering Co., Ltd., switchgear extension at Summer Lane station and Bourneville and Alma Street sub-stations ; General Electric Co., Ltd., switchgear for Chester Street sub-station ; conversion of turbo-alternator at Hams Hall power station from 25 to 50 cycles, and supply of 3 000 kW motor generator ; Davidson and Co., Ltd., erection of grit collecting plant at Prince's power station ; Thomas Piggott and Co., Ltd., works in connection with grit collecting installation at Prince's generating station ; Belliss and Morcom, Ltd., supply of motor-driven air-compressor for Hams Hall power station ; English Electric Co., Ltd., supply of frequency changers and switchgear.

TRANSFORMER EXPORTS.

With reference to the series of electrical export pictures which were reproduced on page 813 of the December 27th issue, our attention has been drawn to the fact that picture No. 6 illustrates a 33 000 volt transformer by Ferranti, Ltd., and not the English Electric Co., Ltd., as stated.

Digitized by Google

WORK IN PROSPECT.

CARLISLE—New cinema to seat 2 000. Particulars, P. Browne and Sons, architects, Pearl Buildings, Newcastle-on-Tyne.

CARDIFF.—150 houses. Particulars, the City Engineer.

CAVERSHAM.—Rebuilding of "Star Inn." Particulars, Chas. Smith and Son, architects, 154, Friar Street, Reading.

CHARMINSTER.—43 houses. Particulars, Mr. F. J. Dolamore, Borough Engineer.

CLYDEBANK.—320 houses. Particulars, Mr. J. W. Johnson, town clerk.

CUPAR.—Additions to Bell-Baxter School. Particulars, Mr. G. Sandilands, architect, Education Offices, Kirkcaldy.

EPPING.—Remodelling of Church of England School. Particulars, Mr. J. Stuart, county architect, Springfield Old Court, Chelmsford.

GUILDFORD.—Shops and offices to cost £5 000. Particulars Mr. Fred Hodgson, High Street, architect.

HALESOWEN.—Extension, etc., of Halesowen Grammar School. Particulars, Mr. A. T. Butler, 31 Priory Street, Dudley.

HALIFAX.—New high school for girls. Particulars, Mr. A. C. Tipple, borough engineer, Halifax.

HARROW.—Extensions to Harrow Hospital to cost £22 478. Particulars, H. Neal, Ltd., Northwood, contractors.

HOUNSLOW.—89 houses. Particulars, P. Chase Gardener and Co., architects, Hounslow. 24 houses. Particulars, G. Wimpey and Co.—Factory. Particulars from J. Monro and Son.

LONDON (KENSINGTON).—24 flats. Particulars, the Borough Engineer, Town Hall, Kensington, W.8.

METHIL.—Additions to St. Agatha's R.C. School. Particulars, Mr. G. Sandilands, architect, Education Offices, Kirkcaldy.

NEW BRIGHTON.—Erection of Yacht Club, bandstand, etc., on Promenade Pier. Particulars, the Borough Engineer, Town Hall, Wallasey.

THE NATIONAL REGISTER.

Further Ten Names Added to the List of Registered Contractors.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on January 3rd, applications from twelve electrical installation contractors for registration were considered. Of this number two were declined and ten accepted, the names of the successful applicants being given below, together with their addresses :—

Douglas, Alan H., 434, Great Cheetham Street, Higher Broughton, Salford.

Burgess, Arthur, Old Street, Stalybridge.

Langley, F. W., and Co., Slippery Street, Broad Street, Hanley, Stoke-on-Trent.

Westaway, John, 10, Kenworthy Lane, Northenden, near Manchester.

Coupland, Victor, 761, Hessle Road, Hull.

Jones, Peter, Ltd., Sloane Square, London, S.W.1.

Cornall, Thomas, Ltd., 8 and 10, Haymarket Street, Bury.

Morgan, Edward G., Radio House, Ystrad Mynach, Glam.

Ive, Leonard J., 7, Clarendon Corner, Watford, Herts.

Coulehan, John C., 19, Percy Street, Hull.

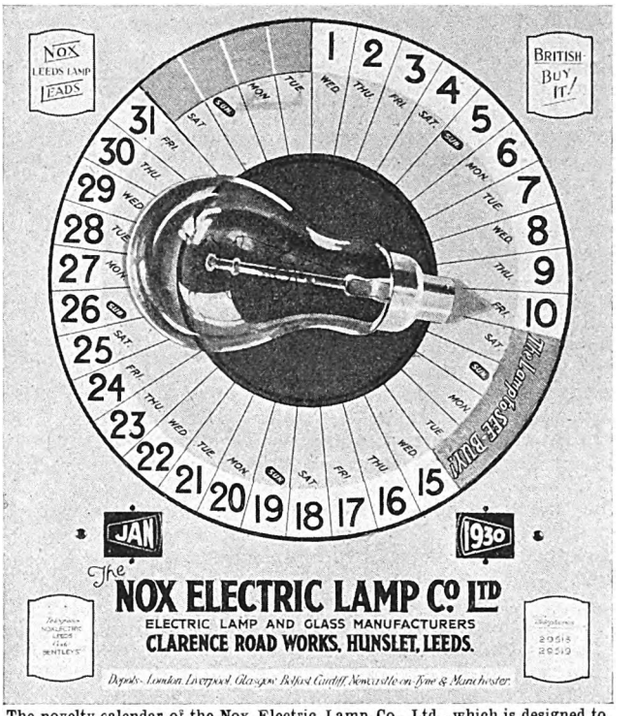
TRADE CALENDARS, ETC.

We have received 1930 calendars from the London Electric Wire Co. and Smith's, Ltd., Church Road, Leyton, London, E.10; Haslam and Stretton, Ltd., Thor Works, Tredegar Street, Cardiff; the United Steel Companies', Ltd., Sheffield (and diary); the Hart Accumulator Co., Ltd., Stratford, London, E.15 (and blotter); the Lea Recorder Co., Ltd., 28, Deansgate, Manchester (diary); the Wholesale Fittings Co., Ltd., 23, Commercial Street, London, E.C.; the Lancashire United Transport and Power Co., Ltd., 81, Renshaw Street, Liverpool, and Wm. Geipel, Ltd., 156, Bermondsey Street, London, S.E. (diary).

A calendar of outstanding originality has been received from the NOX ELECTRIC LAMP CO., LTD., Clarence Road Works, Hunslet, Leeds. This calendar, printed on tin, is arranged with variable indicators for months, years, figures and days, giving sufficient combinations to cover eleven years. The general appearance of the calendar will be appreciated from the illustration in the next column, while the colour scheme may be understood to be particularly attractive.

TRADE PUBLICATIONS.

A "UNIVERSAL" reference book containing over 200 pages and dealing with electrical appliances, heating, cooking, washing, cleaning, lighting for the home, commercial, industrial and shop window lighting, etc., has been published by L. G. HAWKINS AND CO., 30/35, Drury Lane, Kingsway, London, W.C.2.



The novelty calendar of the Nox Electric Lamp Co., Ltd., which is designed to last eleven years. See note on this page.

Three new publications by the MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, London, W.C.2, are leaflet No. 1109 describing type T.N.7 short wave transmitter, leaflet No. 1070/3 dealing with Type X.M.D.1a, 250 W fixed wavelength telephone sets, and leaflet 1108 concerning type Y.A.4 20/50 W portable equipment.

The SUN ELECTRICAL CO., LTD., 118, Charing Cross Road, London, W.C.2, has issued an abridged edition of the fittings catalogue. This has been produced in order to show the change in fittings designs since the issue of the main fittings catalogue, list No. 473, and whilst it does not completely replace that catalogue, the models illustrated in the new list are more in line with modern ideas.

"THE WIRELESS TRADER" YEAR BOOK.

New Edition with Many New Features—Summary of New Marconi Licence Terms.

THE sixth edition of "The Wireless and Gramophone Trader" Year Book and Diary has just been published. Revised and improved in many directions it provides a veritable encyclopædia of information—every page of which will be of value during 1930 to wireless and gramophone traders. A comprehensive summary of the new Marconi licence has been included, together with a list of the nineteen scheduled patents and a brief explanation of the nature and scope of each. Considerable gramophone trade information has been added, including a classified list of the various makes of records on the market, showing at a glance their manufacturers, labels, reference codes and prices. The trade lists have all been revised and corrected. In three of these sections, viz., the list of manufacturers' names and addresses, the classified buying guide section, and the alphabetical list of proprietary names—the wireless and gramophone trades have been combined instead of appearing in separate lists as in the previous edition of the Year Book. In the remaining sections (the alphabetical and territorial lists of factors) the wireless and gramophone trades have been kept separate. The Year Book is to subscribers 3s. 6d., post free, and to non-subscribers 5s. 6d., obtainable from the Trader Publishing Co., Ltd., St. Bride's House, Salisbury Square, Fleet Street, London, E.C.4.

ELECTRICITY SUPPLY.

Llantarnam Supply Scheme—Loan for Assisted Wiring at Preston—Dewsbury's Bulk Supply—Inauguration of Withernsea Undertaking—Preferential Charges by Irish Electricity Supply Board—The Ben Nevis Pipe Line.

THE Electricity Commissioners have granted the Sevenoaks and District Electricity Extension Order.

Barnoldswick's electricity department has received 300 applications for supplies, and 259 houses and shops have been connected to the mains.

Barnsley Electricity Committee recommends a scheme for centre suspension lighting of streets, at an estimated cost of £600, at Dodworth Road.

Plymouth Electricity Committee, on December 31st, approved cable extensions in 18 streets and roads in Plymouth and Devonport, at a cost of about £2 881.

Llantarnam U.D.C. has decided to enter into an agreement with the South Wales Electrical Power Distribution Co. with regard to a supply of electricity for the district.

Marylebone (London) Electricity Committee recommends the provision of cables and switchgear at a cost of £20 500 in connection with future bulk supplies to Hampstead B.C.

Rotherham Electricity Committee has authorised the expenditure of such sum of money as may be necessary to increase the steaming capacity of the boilers at the electricity works.

The sanction of the Electricity Commissioners to the borrowing of £10 000 by Preston Corporation for the wiring of consumers' premises on the hire purchase system is being sought.

The electrification of the Llewellyn (Nixon's) Merthyr Vale colliery is being carried on with all possible speed, but delay had taken place with different landowners in connection with the transmission line.

Eastbourne Electricity Committee has referred tenders for distribution lines to East Dean and Friston to the consulting engineer, the lowest being that of W. T. Henley's Telegraph Works Co., Ltd., at £2 537 9s. 8d.

Southend T.C. has applied for sanction to borrow £12 000 for house services, £4 300 for reconstruction of the d.c. switchboard at the main generating station, and £100 000 in connection with the change over of the system.

Uxbridge and District Electric Supply Co., Ltd., has obtained land at the Middlesex Sanatorium Estate for the erection of a transformer chamber in connection with the proposed supply of electricity to Harefield Village.

Dewsbury T.C. has for many years taken a supply of electricity in bulk from the Yorkshire Electric Power Co., and has now decided to close down its own generating station and to purchase the whole of its requirements from the company.

The Torquay Extension (No. 2) Order has been made by the Electricity Commissioners, and Torquay electricity department has been instructed to make a survey and submit a scheme or schemes to deal with the additional area as soon as possible.

The West Lancashire R.D.C., which gives a supply of current in the Maghull and Lydiate areas, has obtained sanction to borrow £5 015 for the purchase of domestic apparatus for hire to consumers and £1 000 for the wiring of houses on the instalment plan.

The supply of electricity at Withernsea was recently inaugurated. The undertaking was promoted by the Holderness Trust, Ltd., some 18 months ago, and has been carried through by the South-East Yorkshire Light and Power Co. at an estimated cost of £40 000 to £50 000.

Bermondsey (London) Electricity Committee reports that the first 1 500 kW rotary convertor has been removed from the generating station and erected and connected in the new central electricity station. The dismantling and re-erection of the machine was carried out by the Council's own staff.

Dalkey U.D.C. has protested against the preferential charges proposed to be made in certain areas for the supply of electricity. In replying to a similar complaint by Ennis U.D.C. the Electricity Supply Board stated that the Board felt that where they had taken over existing stations they should reduce the cost of current.

Chester Corporation has adopted the Electricity Committee's recommendation to carry out the change-over of the system of supply from d.c. to a.c. during the next three years, at an estimated expenditure of £70 000, and to apply to the Unemployment Grants Committee for a grant of 50% of the interest on the capital expenditure.

The West Midlands Joint Electricity Authority has approved a £300 000 scheme for the distribution of electricity in the north-eastern sector of Shropshire. This embraces an area of over 100 square miles and affects a population of 68 000. The work will be commenced immediately sanction by the Electricity Commissioners is obtained.

Guildford Electricity Committee has decided to renew the cable supplying the Whitelanes district, where the demand is developing rapidly.—The Electrical Engineer recommends that in future the Corporation compensate consumers whose wireless eliminators are affected by the change in the system of supply, to the value of the eliminators affected.

Leeds Corporation has passed plans submitted by the Central Electricity Board showing the line of overhead cable proposed to be erected, extending from the generating station at Kirkstall to the city boundary in the directions of Bradford and Wakefield.—The Corporation has voted £20 000 for additional switchgear for the Kirkstall station.

Ripon Electricity Committee has decided to make a special charge in respect of residential hotels, where the minimum demand is 3 kW or more, at the rate of £9 per kW per annum, plus 1½d. per kWh, such special charge to apply to lighting only.—Mains are to be laid in Harrogate Road, at a cost of £1 523.—The Committee seeks sanction to borrow £3 000 for distribution mains.

It has been decided that a transforming station, under the South-East England Electricity Scheme, shall be established in Lodge Lane, Marylebone, in connection with the transmission lines from Walthamstow to Marylebone, via or with connections to Hackney, Poplar, Stepney, Shoreditch, Islington and St. Pancras; from Marylebone to Fulham; and from Grove Road to Marylebone.

Mr. C. H. Yeaman, city electrical engineer, Stoke-on-Trent, reports that all technical officers had been reminded of instructions previously issued regarding the necessity for cables to be laid at a safe distance from gas mains. It has been agreed that the employees of the electricity department be transferred to the North-West Midlands Joint Electricity Authority with effect from April 1st, 1930.

An application has been received by Dungannon U.D.C., from the Dungannon Gas Co., requesting the Council's consent to the granting of a special Order by the Electricity Commissioners to supply electricity in the urban district and the adjacent area. The Council, however, has consented to a similar application by Messrs. Graham Bros., Dromore. The Council is to have an option to purchase the plant within ten years.

Burnley Corporation has received a letter from the Electricity Commissioners suggesting the acceleration of electrical schemes to relieve unemployment. The electrical engineer, Mr. J. E. Starkie, has reported that work in connection with the change system of supply from d.c. to a.c. in parts of the area can be put in hand, at an estimated cost of £50 000. A committee is to consider and report upon the matter.

The Staveley Coal and Iron Co. has recently achieved a record at its electricity generating station at the Staveley works, 1 730 000 kWh having been generated in one week for light and power for works, collieries and housing estates. Nearly the whole of the electricity was produced by generators driven by the company's gas engines, which consume blast-furnace gas, and are said to be the largest of their kind in the world.

The Borough Electrical Engineer has reported to Tynemouth Electricity Committee that s substantial reduction both in charges for current and in meter rents has already been made, and the assessments of the electricity works have been enormously increased, with the result that the rates and taxes this year will be increased from £2 722 to £6 000. The Committee has, however, decided to make a further reduction of 6d. in all meter rents.

The remaining barrier of rock excluding the water of Loch Treig from the 15-mile-long tunnel through the Ben Nevis range was electrically fired last Friday by Mrs. Murray Morrison, wife of the managing director of the British Aluminium Co. Under our picture of the pipe line at Fort William in our last issue we referred to it, in error, as a part of the Grampian electricity scheme, instead of the British Aluminium Co.'s Fort William scheme.

COMPANY NEWS.

Few Important Changes in Stock and Share Prices—New German Electrical Company —Telephone Manufacturers' Arrangement—New Companies.

NO very great activity is yet in evidence in the market for electrical shares—supply, transportation or manufacturing—and but few important changes have occurred in quotations since our tabular comparison last appeared, on the eve of the Christmas holidays. A feature has been the renewed weakness of the 7% cumulative preference shares of the British Electric Transformer Company. These stood a year ago at 15s., and for the last two or three months at about 2s. below that level. Just before Christmas they changed hands at 10s., and last week at as low as 9s. The English Electric Co.'s ordinary shares have recovered somewhat, and after having been below 4s. are up again to 5s., which, however, compares with 7s. 6d. at the beginning of 1929. Associated Electrical Industries ordinary have also recovered during the past week from 25s. 6d. to 27s., and Ever Readies from 18s. 6d. to 18s. 9d. Electric Construction debentures have put on over 4 points from 67 to 71½, and Edison Swan debenture stock is up from 82½ to 84½.

Hydro-Electric Securities opened this year weak, but this week have recovered to 40. International Holdings remain a shade over 5. Radio Corporation of America shares are under 44. The anticipated rise in Cables and Wireless stocks is a long while coming, and the only sign this week has been an improvement in the 5½% cumulative preference stock from 96 to 98½. Marconi Marine shares remain steady at 45s.

Calcutta Electricity Supply shares have been sold lately, and the price of the ordinary shares this week has fallen 3s. 9d. to 45s. 7½d.; and of the 5% cumulative preference shares from 21s. 3d. to 20s. Clyde Valley Power shares continue to sag, and are now at 35s., as against over £2 a couple of months ago. Metropolitan Supply ordinary shares have fallen during the past week from 37s. 6d. to 36s. 9d. London Power and Whitehall Investment debentures are both firmer. Lancashire 6% 1st preference are 6d. better at 27s. 6d., as also are Adelaide preference at 21s.

Underground Electric Railways Company of London ordinary shares have weakened from 21s. 6d. to 21s. London Electric Railway 4 per cent. debentures are 1½ points higher.

Directors' Reports, etc.

PENN-OHIO EDISON CO.—Intm. div. on common stk. $\$\frac{1}{2}$ will be payable on Feb. 1.

COMMONWEALTH POWER CO.—Intm. div. of $1 on common stk. will be payable on Feb. 1.

ALTRINCHAM ELECTRIC SUPPLY, LTD.—Intm. div. 1s. $3\frac{6}{7}$d. p. 1s. dfd. sh. is announced.

NORTHERN OHIO POWER AND LIGHT CO.—Qrtrly. divs. of $1\frac{1}{4}$% on 6% pfd. and $1\frac{3}{4}$% on 7% pfd. are announced.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Regular qrtrly. div. of 30 cents p. sh. will be payable on Jan. 15.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Regular half-yearly div. of $2\frac{1}{2}$% (at rate of 5% p.a.) on shs. of "B" pfd. stk. will be payable on Feb. 1.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—The corporation has secured a controlling interest in the Compania Peruviana de Telefonos.

BRITISH COLUMBIA ELECTRIC RAILWAY CO., LTD.—A div. on 5% cum. perpetual pref. stk. for half-year ended Dec. 31 of $2\frac{1}{2}$% will be payable on Jan. 15.

ASSOCIATED TELEPHONE AND TELEGRAPH CO.—Qrtrly. div. of $1 p. sh. on class "D" stk and qrtrly. div. of $1 p. sh. plus additnl. and participatg. div. of 25 cents on class "A" stk. are announced.

BENGAL TELEPHONE CO., LTD.—Net pft. for year ended June 30, 1929, Rs. 798 209. Written off multiple jacks and switchboard cable in stores, Rs. 75 000; div., 8%; fwd., Rs. 56 203, agst. Rs. 32 897.

BRIDGWATER AND DISTRICT ELECTRIC SUPPLY AND TRACTION CO., LTD.—Transfer books of 7% cum. pref. shs. will be closed from Jan. 18 to 31, inclusive, for preparatn. of div. warrts. for half-year endg. Jan. 31, 1930.

OFFICIAL QUOTATIONS.—The Stock Exchange Committee has granted official quotations to 40 000 £1, fully paid, $6\frac{1}{2}$% cum. pref. shs. of Davis and Timmins, Ltd., and 5 313 £1, fully paid, ord. shs. of the Underground Electric Railways Co. of London, Ltd.

CHILI TELEPHONE CO., LTD.—It has been decided to change the company's financial year so that it shall end, in future, on Dec. 31. At next gen. mtg., early this year, accts. will be submitted covering period from Apr., 1928, to Dec. 31. Service of company continues to expand and number of subscribers is increasing.

NORTH AMERICAN CO.—Company has decided upon a 1930 constructn. budget calling for £11 400 000. £5 000 000 of new cap. has been raised, a large proportn. of which will be used for new hydro-electric statn. on Osage River, Missouri, wh. will cost about £6 000 000, and its initial capacity will be 129 000 kW.

LOCHABER POWER CO.—A mtg. of the proprietors will be held on January 28th, at 2.30 p.m., at Adelaide House, King William Street, London, E.C.4, to consider the Provisional Order, for which application has been made, to extend the time for completion of certain works authorised by the Company's 1921 Act, to extend the area of supply, etc.

EVER READY TRUST AND FINANCE CO., LTD.—Rpt. for period Nov. 14, 1928, to Dec. 31, 1929, states that, after meeting exes., rev. acct. shows blce. of £43 837, less income tax, £8 675. Written off prelim. exes., £11 040; placed to cap. res. acct., £9 536; fwd. £14 586. The div. on the 500 000 8% cum. pref. shs. of £1 each, fully paid, in Lissen, Ltd., has been credited in the accts.

STANDARD ELECTRICITATS GESELLSCHAFT A.G.—This company, which has a cap. of Mk. 25 000 000, has been formed by the International Standard Electric Corporation, New York, the A.E.G. and the Felten and Guilleaume Co. The new company holds the majority of shs. in the Ferdinand Schuchhardt Berliner Fernsprech und Telegraphenwerk A.G. and the Mix and Genest Aktien Gesellschaft, Berlin.

ASCOT DISTRICT GAS AND ELECTRICITY CO.—Under the Bill in Parliament deposited by the company it is proposed to convert the original ord. £10 shs. into consolidated sliding scale stk., and to convert into maximum div. stk. the 2 930 additional ord. 7% £10 shs. and the whole of the 3 000 6% pref. £10 shs. Maximum divs. stk. is to be entitled to a fixed maximum div. of 7%, unless div. paid on sliding scale stk. shall be at a less rate than 5% p.a., in which case a proportionate reductn. will be made. It is also proposed to create additnl. cap. to extent of £40 000, etc.

ARRANGEMENT BETWEEN TELEPHONE MANUFACTURERS.—A fusion of mfg. interests has been arranged between the Relay Automatic Telephone Co., Ltd., and the Sterling Telephone and Electric Co., Ltd. The mfg. facilities at Relay House, Streatham Hill, London, will be considerably augmented to deal with the dual output of the two companies, which will mfre. automatic telephone apparatus and manual telephone apparatus, respectively. Inquiries in connection with the Sterling Co.'s products should now be addressed to Relay House, Streatham Hill, London, S.W.2.

SOUTHERN CANADA POWER CO.—Erngs. for year ended Sept. 30, $1 001 812 net, agst. $855 073; divs. on pfd. stk. absorbed $298 538, agst. $297 063, and on common stk. $388 734, agst. $308 912. To depreciatn. res., $209 590, agst. $181 000. Fwd. $339 281. Number of connected customers increased from 23 552 to 25 543. Sales of merchandise departmt. amtd. to $416 344 agst. $302 000. Many new and importt. industries have been established in territory served by company. Output of electricity 154 528 950 kWh agst. 138 160 340. For first time company has earned approximately 5% on its assets.

PERAK RIVER HYDRO-ELECTRIC POWER CO.—In order to enable the company to complete its power scheme, the Federated Malay States Government has offered a loan of £850 000, carrying int. at the rate of 5% p.a. The loan will rank as a charge immediately after the first guaranteed debs., and will be repayable by means of a sinkg. fund. The terms of the loan provide that the company's articles of association be amended to confer voting rights on the 500 000 £1 pref. shs., which are all held by the F. M. S. Governmt., which will thus have votg. control by virtue of its holdg. of ord. and pref. shs. The terms also provide that the date of repaymt. of 7% deb. stk. be extended to July 31, 1961.

TATA HYDRO-ELECTRIC POWER SUPPLY CO., LTD.—Rpt. for year ended June 30, 1929, states that electricity sold amtd. to 102 000 000 kWh, agst. 114 000 000. Rev. Rs. 40 00 000 (agst. Rs. 45 00 000), net pft. Rs. 16 41 203 (agst. Rs. 21 44 592), ord. div. 7% (same), Rs. 1 012 written off brokerage on debs. and loss on investmts., Rs. 1 35 000 to depreciatn. on investmts.; fwd. Rs. 1 55 192, agst. Rs 5 63 224. In view of facts that all expenditre. on plant is met from rev. and that separate funds are maintained for dam amortisatn. and depreciatn. on investmts. and that depreciatn. fund has now accumulated to Rs. 68 56 592, directors are advised that depreciatn. allowance hitherto made of Rs. 7 50 000 is too high, and that it would be sufficient if Rs. 6 lakhs are set aside every year. The rpt. contains a confirmatn. of the recent announcemt. that the American and Foreign Power Co. has acquired a half sh. in the agencies of the four hydro-electric companies of which Messrs. Tata Sons are agents. The agencies will be transferred to "Tata Hydro-Electric Agencies." Total assets are Rs. 5 88 03 941.

ANDHRA VALLEY POWER SUPPLY CO.—Revenue for year ended June 30, 1929, Rs. 48 00 000 (agst. Rs. 52 00 000), net pft. Rs. 7 36 183 (agst. Rs. 6 56 285). Rs. 1 35 000 is provided for depreciatn. on investmts. and Rs. 7 777 written off loss on investmts. sold. Div. on pref. shs. 7% (same); div. on ord. 2% (same); tax free. Fwd. Rs. 29 188 (agst. Rs. 100 082). Electricity sold during year 114 000 000 kWh, agst. 118 000 000. In view facts that all expenditre. for maintenance, repairs or renewals is met from rev., and that separate funds are maintained for dam amortisatn. and depreciatn. on investmts., and that depreciatn. fund has now accumulated to Rs. 42 63 130, directors are advised that depreciatn. allowance hitherto made of Rs. 11 lakhs is too high and that it would be sufficient if Rs. 9 lakhs are set aside every year. Question of reducing rates to cotton mills in Bombay has been receivg. directors' attention for some time, and they have offered to them what amts. to about 10% reductn. in power rates, 20% reductn. in cost of plant supervisn. and 33% reductn. in minimum charge for power. Millowners are considering matter. Assets total Rs. 5 97 98 699. This is one of the four hydro-electric companies of which Messrs. Tata Sons have hitherto been agents. The American and Foreign Power Co. has acquired a half sh. in the agencies, which will be transferred to "Tata Hydro-Electric Agencies."

Company Meetings.

AGRICULTURAL AND GENERAL ENGINEERS, LTD.—Mr. G. E. Rowland, presiding at the meeting on December 31st, said constituted as a holding company, they were dependent upon their subsidiary companies for their revenue. The report showed that 11 companies made in the aggregate £235 596 profit, while two companies showed losses of £19 838, the result being that the subsidiary companies as a group traded at a profit of £215 758. During the six months to September 30th last each firm in their group traded at a profit. The

Digitized by Google

companies deducted off the £215 758 profit, on plant, buildings and maintenance account, £71 033; for depreciation, £46 679; for writing down stock values, £41 900; for taxation, £6 341; and dividends and interest on shares and debentures held by outsiders in certain subsidiary companies, £15 837; leaving a balance £33 968. Two subsidiary companies did not last year write off any depreciation, as adequate provision had previously been made. Generally it could be stated that the concern recovered last year from the set-back that followed the coal lock-out of 1926, and that the progress prior to that date had been resumed. One satisfactory feature of the parent company's accounts was that its liabilities during the year were reduced by the substantial sum of £305 156, due largely to the completion of the sale of the Aldwych House property and of the sale of the debentures later issued to them. The export sales organisation is now in full operation. Their overseas branches in Argentina, Chile, India, Australia and Africa were making very satisfactory progress. A branch in New Zealand would be opened in January. The report and accounts were adopted.

BOGOTÁ TELEPHONE CO., LTD.—Mr. H. S. Bennett, presiding at the meeting on December 31st, said since the company became identified with the Cable, Telephone and General Trust, Ltd., in May last, an energetic policy had been adopted to supply service to the waiting applicants in Bogotá, and to plan for the future, so that Bogotá would have a telephone service of the highest order, which the city's importance and size warranted. For the purpose of expediting the completion of the work of installing the new switchboard in the main exchange, and also of laying and connecting up the underground cables through which the lines to the subscribers' premises pass, the engineering staff in Bogota had been doubled in size, and part of the new switchboard was already in use. During the year now under review approximately 1 000 new stations were added and for the first five months of the current financial year they had already connected up almost a like number of new stations, and they were confident that practically all the waiting subscribers would be connected up after the completion of the installation of the switchboard in March next. An addition has also been ordered for the new Chapinero exchange. In addition to the foregoing, an engineering survey had been completed and plans were in preparation for the supply of adequate equipment to meet the demand for the next ten years. Also an arrangement has been made with the Cia. Telefonica Central for connection between the Bogotá local system and the long-distance toll lines now under construction, so that their Bogotá subscribers would be provided with facilities for through communication with the important seaport of Buenaventura and also with the intermediate cities of Cali, Manizalés, Ibague, and Girardot. The future earning capacity of the company must depend largely on their ability to obtain an increase in the present tariff rates, and in this connection he had no further news to convey. The Bogotá Municipality was essentially a body of progressive business men who had the interests of their city at heart, and as the telephone service played such an important part in modern progressive business development, it was only to be expected that the municipality would permit them to earn a revenue which would show an adequate return on the heavy capital outlay necessary in bringing the service into the highest class.

New Companies.

DALE'S, LTD.—Cap., £500. Electrical and wireless engineers, etc. Reg. office: 155, Dale Street, Liverpool.

E. ROWLAND AND CO., LTD.—Cap., £3 000. Electrical and wireless dealers, etc. A director, E. Rowland, Chadleigh, Cecil Road, Ashford Common, Middlesex.

TREE-TOP ELECTRICAL SERVICES AND SUPPLIES, LTD.—Cap., £2 000. Electrical engineers, contractors, etc. Reg. office: 46, Gordon Street, Glasgow, C.1.

LOW PRESSURE LAMPS, LTD.—Cap., £100. Manufacturers of and dealers in incandescent electric lamps, arc lamps, etc. Reg. office: 36, New Broad Street, London, E.C.2.

AIR-WAY, LTD.—Cap., £20 000. Manufacturers of and dealers in electrical apparatus, appliances, parts and accessories, etc. Reg. office: 15/19, Cavendish Place, London, W.

V. W. CO., LTD.—Cap., £300. Welders, engineers, manufacturers, importers and exporters of wireless apparatus, etc. Reg. office: 192, High Street, Stratford, London, E.15.

PEMBROKESHIRE ELECTRICAL POWER & DISTRIBUTION CO., LTD.—Cap., £100. Suppliers and distributors of electricity. Solicitor: J. E. M. Crouther, 15, Abingdon Street, London, S.W.1.

LEICESTERSHIRE AND DERBYSHIRE TRACKLESS HARE CO., LTD.—Cap., £500. To acquire licence or licences to use electric hares, etc. A director: A. A. Allgood, 1, Market Place, Whitwick, Leics.

BATTERY SERVICES, LTD.—Cap., £1 000. Manufacturers and repairers of motors, magnetos, dynamos and other electrical equipment, etc. Reg. office: 98a, New Bridge Street, Newcastle-on-Tyne.

JOHN LINTON AND CO., LTD.—Cap., £300. To acquire the business of an electrical and mechanical engineer heretofore carried on by J. R. W. Linton at Sale, Ches. Reg. office: Newstead, Northenden Road, Sale, Ches.

SWINDON RADIO RELAY EXCHANGE, LTD.—Cap., £2 300. To construct and maintain wireless signal stations for reception or distribution of wireless or radio signals or waves, etc. Reg. office: 14, Victoria Road, Swindon.

CONRAD PARLANTI, LTD.—Cap., £1 000. Architectural craftsmen, etc. A director: S. Grundy, Woodbank, Teddington Park Road, Teddington, electrical engineer. Reg. office: Somerset Works, Somerset Road, Teddington.

MIDWINTER AND CO., LTD.—Cap., £1 500. Finance brokers, business consultants, etc. A director: S. C. Midwinter, 1, Palgrave Mansions, Devonshire Place, Eastbourne, electrical engineer. Reg. office: 265, Strand, London, W.C.2.

MYCALEX (PARENT) CO., LTD.—Cap., £25 000. To acquire certain patents and the trade mark "Mycalex" used in connection therewith; to carry on business of manufacturers of and dealers in mica, mycalex and all kinds of insulating material, electrical engineers, etc. Solicitors: F. P. Woodcock, 5, Holborn, London, E.C.1.

C. H. THOMPSON, LTD.—Cap., £500. To acquire business of Thompson and Mitchell and Northern Arch Electric Welding Co., carried on by Mrs. E. H. Hilton and W. R. Ingoe at Booth Street, Middleton Junction, Lancaster, and to carry on the business of engineers, welders, etc. Reg. Office: Booth Street, Middleton Junction, Lancaster.

J. M. PIRIE AND CO. (LONDON), LTD.—Cap., £6 000. To acquire the business of architectural metal workers carried on by J. M. Pirie and Co., Ltd., and/or N. T. Holme, and to carry on same and business of manufacturers and designers of electric light fittings, etc. Solicitors: Stow, Preston and Lyttelton, 12, Lincoln's Inn Fields, London, W.C.2.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

OSCILLOPHRAGM.—503 122. Class 8. Wireless telephonic loud speakers. Graham Amplion, Ltd., St. Andrews Works, Slough; manufacturers of Wireless Apparatus and loud speakers. May 28th, 1929. (By consent.)

505 073. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching, but including electric cables or kinematograph films, and not including any goods of a like kind to kinematograph films. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. August 6th, 1929. To be associated with No. 472 162 (2 536) and others. Registration of this trade mark shall give no right to the exclusive use of the letters "L.E.C."

ANTHYGRON. 506 888. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Siemens-Schuckertwerke Aktien-Gesellschaft, 101 to 110, Nonnendamm-Allee, Berlin-Siemensstadt; manufacturers. October 14th, 1926. To be associated with No. 506 886 (2 697) v and others.

HUM-DINGER.—503 668. Class 8. Fixed and variable electrical resistances. Claude Lyons, Ltd., 76, Old Hall Street, Liverpool; manufacturers. June 14th, 1929.

GRAMPLIFIER.—507 160. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching Harold Edgar Du Pre, 42, King Street, Jersey; merchant. October 23rd, 1929.

UFATONE.—507 393. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching, but not including gramophones. Universum-Film Aktiengesellschaft, Kochstrasse 6 and 8, Berlin, S.W.68; manufacturers. October 31st, 1929. To be associated with No. 507 392 (2 699) i and another. (By consent.)

CHROMALOX.—498 282. Class 13. Electric immersion heaters; and heating devices in the form of strips and rings, being parts of electrical heating apparatus; all being metal goods not included in other classes. Geo. Bray and Co., Ltd., Bagly Works, Leicester Place, Leeds; lighting engineers. December 20th, 1928. To be associated with No. 490 053 (2 614), xviii.

DYALMO.—505 352. Class 6. Electric lighting, power and ignition machines and parts thereof for motor vehicles and cycles. The M-L Magneto Syndicate, Ltd., Victoria Works, West Orchard, Coventry; manufacturers. August 16th, 1929.

SOLAR.—502 340. Class 8. Wireless telephonic apparatus, gramophones and parts thereof, and gramophone records, but not including electric batteries or accumulators, and not including any goods of a like kind to any of these excluded goods. The British Homophone Co., Ltd., 67 to 69, City Road, London, E.C.1; manufacturers. May, 1st, 1929. To be associated with No. 503 112 (not yet advertised).

S.P. (Sign).—504 861. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Siemens Planiawerke Aktien-Gesellschaft für Kohlefabrikate, Herzbergstrasse 128 to 137, Berlin-Lichtenberg; manufacturers. July 29th, 1929. To be associated with No. 504 862 (2 698), xviii and another. (By consent.)

PENTECTOR.—507 888. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Lissen, Ltd., Lissenium Works, Friars Lane, Richmond, Surrey manufacturers. November 18th, 1929.

KAPPIT.—507 455. Class 8. Electric cables. Callender's Cable and Construction Co., Ltd., Hamilton House, Embankment, London, E.C.4; manufacturers. November 4th, 1929.

PHOTOMIRENTA.—505 349. Class 13. Electric lamps and electric lighting fittings, all being metal goods not included in other classes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, Emmasingel 13d, Eindhoven; manufacturers. August 16th, 1929. (Date claimed under International Convention, April 23rd, 1929.)

PHILILUX.—505 343. Class 13. Electric lamps and electric lighting fittings, all being metal goods not included in other classes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, Emmasingel 13d, Eindhoven; manufacturers. August 16th, 1929. (Date claimed under International Convention, April 23rd, 1929.) To be associated with No. 505 345 (2 698) and others.

PHILIARAY.—505 345. Class 13. Electric lamps and electric lighting fittings, all being metal goods not included in other classes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, Emmasingel 13d, Eindhoven; manufacturers. August 16th, 1929. (Date claimed under International Convention, April 23rd, 1929.) To be associated with No. 505 343 (2 698) and others.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CAMDEN ELECTRICAL CO., 163, Camden Road, Tunbridge Wells, electrical engineers. £16 4s. 1d. November 4.

CASTELLINA CO. (1926), LTD., 9, Hallam Street, Great Portland Street, W., electricians. £11 13s. 2d. November 19th.

COATES, Dennis, Anson Street, Rugeley, wireless dealer. £17 13s. 5d. November 20th.

CROOK, Robert, Isherwood, Hammonds Yard, King Street, Huddersfield, electrical contractor. £16 15s. 6d. November 19th.

DOWLING AND PRIMAVESI, 14/16, New Rents, Ashford, electrical engineers. £23 0s. 6d. November 21st.

FERRIDAY, L., Empire Arcade, Stockton, wireless dealer. £33 2s. November 12th.

FERRIS, Mr. L., 14, St. Mary's Place, Newcastle-on-Tyne, magneto agent. £25 1s. 8d. November 22nd.

INGHAM, George, 128A, Town Road, Rodley, Leeds, wireless dealer. £22. November 6th.

JACKSON AND CO., 54, Broadway, Leigh-on-Sea, electrical engineers. £16 8s. 2d. November 19th.

OVERTON AND SON, 139, Canterbury Street, Gillingham, wireless dealers. £10 16s. 6d. November 5th.

RAMSDEN, Mr. W., 37, Hollins Park Mount, Roundhay, Leeds, electrical contractor. £47 7s. 11d. November 20th.

RIVER RADIO, Petersham, wireless dealers. £13 18s. 5d. November 6th.

ROBERTS, T., 125, Upper Commercial Street, Batley, wireless apparatus dealer. £10 6s. 9d. November 25th.

SENIOR, Stewart, 961, Abbeydale Road, Sheffield (trading as SENIORS WIRELESS STORES), wireless dealer. £22 4s. 7d. November 15th.

STEGMAN AND CO., Brighton Railway Approach, Clapham Junction, electrical engineers. £15 7s. 4d. November 6th.

SYKES, William, 62, Bolton Road, Ramsbottom, electrical contractor. £15 19s. November 20th.

Receivership.

HARMONY, LTD.—A. G. Cox, of 7, Duke Street, Adelphi, W.C. was appointed Receiver on December 18th, under powers contained in debenture dated June 22nd, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD.—Registered December 21, £400 000 debentures, inclusive of £286 000 already registered (secured by Trust Deed dated December 10, 1929); general charge. *£286 000. March 12, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

FREEZONE, LIMITED, electrical refrigerator manufacturers, 839, Harrow Road, Willesden Junction. A meeting of the creditors in this voluntary liquidation was held on January 3rd at the offices of Barton, Mayhew and Co., C.A., Alderman's House, Alderman's Walk, Bishopsgate, London, E.C.2, when it was reported that liabilities amounted to £7 516 and assets, after allowing for the mortgage on the premises and for preferential claims, were £4 512. The assets consisted of leasehold properties, £2 537; plant and tools, £237; furniture, £66; stock in trade, £1 727; debtors, £500; and cash at bank, £105. The mortgages on the premises were £510; whilst the preferential claims absorbed £150. It was reported that the present position had been brought about by lack of capital and for some time past the company had been endeavouring to obtain liquid resources. Negotiations were pending for a possible offer for the business as a going concern, and if expectations were realised, there would be 20s. in the £ for the creditors. Unfortunately, the matter could not be decided one way or the other until the beginning of February, and the directors had adjourned the shareholders' meeting in order that the creditors could consider the position. The product of the company was well-known but owing to a lack of money it had been impossible to carry out an advertising campaign. It was decided that the meeting should be adjourned for six weeks in order to see whether the negotiations could be carried through.

London Gazette, etc.

Winding-up Petition.

SYMPHONY GRAMOPHONE AND RADIO CO., LTD. A creditors' petition for winding-up has been presented by the Plessey Co., Ltd., Vicarage Lane, Ilford, Essex, electricians, electrical engineers and manufacturers, and is to be heard at the Royal Courts of Justice, Strand, W.C.2, on January 20th.

Companies Winding-up Voluntarily.

TALGARTH ELECTRIC SUPPLY CO., LTD.—By special resolution, December 27th. H. Ashton, Victoria Hall, Llandrindod Wells, corporate accountant, appointed as liquidator.

UNIVERSAL ACCUMULATORS, LTD.—By special resolution, December 31st. C. A. Frith, appointed as liquidator.

Bankruptcy Information.

JAUNDRILL, Alexander, 21, Duke Street, St. Helens, Lancaster. radio and gramophone dealer. Receiving order, January 2nd, Debtor's petition.

Notice of Dividend.

GARNETT, William Terrell, trading as W. T. GARNETT'S CABLE Co., Barkerend Mills, Bradford, electric cable and wire manufacturer. Supplemental dividend, 4⅜d. per £, payable January 11th, Official Receiver's office, 12, Duke Street, Bradford.

Notice of Intended Dividend.

BARNETT, Timothy, 934, Woodborough Road, Mapperley, lately 622, Mansfield Road, Sherwood, Nottingham, electrical contractor. Last day for receiving proofs, January 20th. Trustee, R. B. Rhodes, 18, Low Pavement, Nottingham.

Partnership Dissolved.

LEWIN AND MURRAY (Arnold LEWIN and John Thomas MURRAY), electric light, heat and power engineers, 3, Lord Street, Halifax, Yorks, by mutual consent as from December 31st, 1929. Debts, received and paid by A. Lewin, who will continue the business under the style of A. Lewin and Co., Ltd.

Application for Discharge.

WORSNIP, William, 36, Market Hall, Walham Green, London, wireless dealer. Hearing, January 28th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Order Made on Application for Discharge.

HOLMES, Harold, 60, Ward's End, Loughborough, Leicester, sanitary plumber and electrical contractor. Discharge suspended for two years until December 4th, 1931.

METAL AND CHEMICAL PRICES.

		TUESDAY, January 7th. Price.	Inc.	Dec.

Rubber—Para fine, 8¼d.; plantation, 1st latex, 7 15/16d.

∴ The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

The market has been subject to holiday influences, and according to James Forster and Co. little business has been transacted during the past fortnight. No new feature has arisen except a sudden advance of 5s. per ton in the December position on the last day of the year. The American market is quiet, with the price unchanged at 6·25 cents per lb.

Closing prices on January 3rd were £21 8s. 9d. for January, £21 10s. for February, March and April, practically unchanged since our last report.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

319 717 P. D. Tyers. Electric gramophone pick-ups. (26/6/28.)
314 403 Associated Telephone and Telegraph Co. Telephone systems. (19/10/27.)
320 016 J. Y. Johnson (I. G. Farbenindustrie Akt.-Ges.). Manufacture and production of magnetic cores of high permeability. (14/7/28.)
319 885 S. M. Rutnagur. Electric traction for railways. (24/9/28.)
320 026 D. E. Washington. Electrical accumulators and storage batteries. (31/3/28.)
320 096 F. Chevrier, and M. L. Grille. Process and apparatus for the electrolytic preparation of antiseptic and cicatrising solutions. (4/4/28.)
320 097 P. Frenell. Electric piston motors. (5/4/28.)
320 045 A. H. Midgley. Electromagnetic cut-outs, switches, and the like. (18/4/28.)
289 834 Ganz-Fele Villamossagi Reszvenytarsasag. Alternating current supply systems. (3/5/27.)
294 977 Lorenz Akt.-Ges., C. High frequency oscillation generators. (3/8/27.)
290 167 Siemens and Halske Akt.-Ges. Carbon microphones. (7/5/27.)
320 031 M-O Valve Co., Ltd. and J. W. Ryde. Electric gas-discharge rectifiers. (25/5/28.)
320 051 H. J. Tibbles and Rely-a-Bell Burglar and Fire Alarm Co., Ltd. Means for securing in position the electric conductors of alarm circuits. (29/5/28.)
320 032 M. Latour. Motor control system. (30/5/28.)
320 078 A. Robinson and Co., Ltd., J. F. Gill, and J. N. Chaviara. Telegraphs for use in ships, power stations, and the like. (31/5/28.)
320 055 C. Rickards, Ltd., and J. D. Henderson. Illuminative advertising apparatus. (26/6/28.)
320 036 J. G. Miller, and Bullers, Ltd. Clamps for holding cables or the like. (27/6/28.)
320 081 S. G. Brown. Sound reproducing or transmitting instruments. (28/6/28.)
320 038 Imperial Chemical Industries, Ltd., and T. R. Warren. Automatic control of turbo-alternators. (29/6/28.)
294 642 British Thomson-Houston Co., Ltd. Adjustable magnet devices. (29/7/27.)
320 039 J. A. Crabtree. Electric switches of the tumbler type. (30/6/28.)
307 040 Siemens and Halske Akt.-Ges. Circuit arrangement for telephone installations. (3/3/28.)
320 082 British Thomson-Houston Co., Ltd., H. Jack, and F. H. Clough. Systems of ship propulsion. (2/7/28.)
320 061 Automatic Telephone Manufacturing Co., Ltd., F. Kessler, and A. G. Forster. Inter-connecting arrangements for use in telephone systems. (2/7/28.)
293 862 Siemens-Schuckertwerke Akt.-Ges. Vacuum switches for dealing with high electric outputs. (14/7/27.)
320 070 F. A. Lindemann. Line source of light varying with applied electrical energy for observing or recording rapid variations in current or potential. (3/7/28.)
320 073 A. R. Dunton and Associated Electrical Industries, Ltd. Sealing devices for the covers of transformer tanks and other vessels. (3/7/28.)
320 075 Igranic Electric Co., Ltd., and G. F. Dandridge. Formers for electric coils. (3/7/28.)
320 086 Siemens Bros. and Co., Ltd., E. A. Petithory and F. Baker. Telephone instruments. (3/7/28.)
320 091 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Secrecy systems for signalling. (4/7/28.)
312 980 Siemens-Schuckertwerke Akt.-Ges. Geared electromotors for driving manicuring-apparatus or the like. (4/6/28.)
320 108 G. Zwicky. Counter-current evaporators for refrigerating machines. (5/7/28.)
294 241 British Thomson-Houston Co., Ltd. Synchronism-indicating means. (22/7/27.)
295 017 Associated Telephone and Telegraph Co. Remote-control systems. (6/8/27.)
294 980 Associated Telephone and Telegraph Co. Electric remote-control systems. (3/8/27.)
320 114 Automatic Telephone Manufacturing Co., Ltd., W. O. Passmore, and C. E. Beale. Telephone systems. (6/7/28.)
320 117 Klaxon, Ltd., and J. F. Monnot. Manufacture of electric commutators and similar current-interrupting devices. (6/7/28.)

Applications for Patents.

September 24th.

28 957 N. V. Philips' Gloeilampenfabrieken. Reeling wire in helicoidal form. (25/9/28, Holland.)
28 960 United Reproducers Patents Corporation.—Sectional electrostatic reproducer. (14/1/29, U.S.)
28 911 E. W. Whatmore. Coil ignition.
28 929 L. D. Wood. Bracket for supporting electric motors.
28 992 Western Electric Co., Ltd. (Bell Telephone Laboratories, Ltd.) Submarine signalling.

September 25th.

29 026 C. P. Allinson. Mains operated wireless receivers, etc.
29 100 Automatic Telephone Manufacturing Co., Ltd., and A. E. Caswell. Telephone systems.
29 086 J. L. Baird and Television, Ltd. Television apparatus, etc.
29 091 H. Bernstein. Disinfecting telephone instruments.
29 050 British Thomson-Houston Co., Ltd. Light sensitive apparatus. (4/10/28, U.S.)
29 051, 29 052 British Thomson-Houston Co., Ltd., and J. C. Read. Protective systems for mercury arc rectifiers.
29 001 British Thomson-Houston Co., Ltd. Electrical test board.
29 083 A. R. di Fraine. Wave trap for wireless receiving apparatus.
29 066 General Electric Co., Ltd., and W. H. Peters. Transformers.
29 061 J. Hazel. Shades for electric lamps.
29 097 K. Kesl. Contact devices for electrical apparatus.
29 011 F. W. Lanchester. Electric gramophones.
29 014 F. A. Lindemann. Device for converting sound waves into electric fluctuations.
29 033 J. Lucas, Ltd., and O. Lucas. Containers for spare lamp bulbs, etc., for vehicles.
29 078 T. Patermann. Electric hair driers.
29 087 C. Russ. Cap for electric plug contacts.
29 029 L. E. Salas and Standard Telephones and Cables, Ltd. Dielectric material.
29 030 T. R. Scott and Standard Telephones and Cables, Ltd. Electric cable.
29 027 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.) Carrier current telegraph systems.
29 028 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.) Electromagnetic devices.
29 045 F. Storch. Electromagnetic apparatus. (25/9/28, Germany.)
29 073 Universal Gramophone and Radio Co., Ltd., and L. Young. Gramophone pick-ups.
29 071 Electric Furnace Co., Ltd. Resistance furnaces.

September 26th.

29 215 C. S. Agate and W. A. J. Thorn. Electric switchgear.
29 186 R. Ambronn. Apparatus for determining direction of magnetic fields of the earth, etc. (20/11/28, Germany.)
29 144 F. Argyrides and C. Joannides. Electrical time recording and synchronising.
29 191 British Thomson-Houston Co., Ltd. Electric measuring instruments. (27/9/28, U.S.)
29 127 A. O. Couyoumdjian. Electromagnetic speech amplifiers, etc.
29 249 J. Davies. Tuning devices for radio receiving sets.
29 211 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken.) X-ray installations.
29 132 B. W. and G. B. Handley. Electric switches.
29 129 Jenaer Glaswerk Schott and Gen. Ignition devices for mercury vapour apparatus.
29 188 Siemens-Schuckertwerke Akt.-Ges. Telephone, etc., cables. (5/10/28, Germany.)
29 218 Telehor Akt.-Ges. Production of alternating currents for driving synchronous motors. (7/11/28, Germany.)
29 171 F. H. Wingrave. Control mechanism for electric signs.
29 128 H. Wintle. Electric heating elements.
29 120 Wright, Bindley and Gell, Ltd. Electric heating elements.

September 27th.

29 288 Akt.-Ges. Brown, Boveri et Cie. Metal vapour rectifiers. (5/10/28, Germany.)
29 371 Associated Electrical Industries, Ltd. Electric circuit interrupters. (27/9/28 U.S.)
29 299 F. E. G. Bailey and B. Scher. Electrically operated sound producers.
29 279 L. Blundell and W. Curtis. Wireless receivers.
29 338 British Thomson-Houston Co., Ltd. Precision electric lamp. (27/9/28, U.S.)
29 330 British Thomson-Houston Co., Ltd. Means for amplifying electric impulse. (17/10/28, U.S.)
29 295 J. P. Bowen. Submarine or aerial oscillators.
29 380 N. H. Claugh, Gramophone Co., Ltd., and Marconi's Wireless Telegraph Co., Ltd. Electrical correction shaping, etc., arrangements.
29 257 O. Emersleben and Loewe-Radio Ges. Resistance-coupled amplifier. (28/9/28, Germany.)
29 296 E. M. S. McWhirter and Standard Telephones and Cables, Ltd. Printing telegraph apparatus.
29 343 A. H. Mason. Remote control of wireless, etc., apparatus.
29 360 D. von Mihaly. Scanning, etc., discs of television apparatus.
29 310 F. Schwien. Electric indicator of tyre deflation.
29 369 Stickstoffwerke Ges. Galvanic batteries. (28/9/28, Germany.)
29 384 Telefunken Ges. fur Drahtlose Telegraphie. Wireless telegraphy. (28/9/28, Germany.)

COMING EVENTS.

Friday, January 10th.

Institution of Electrical Engineers (North-Western Centre).—Free Trade Hall, Manchester. Faraday Lecture by Captain P. P. Eckersley on "Broadcasting by Electric Waves." 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster, London, S.W. Paper by Mr. H. J. N. Riddle on "The Track Circuit in Railway Signalling." 7.30 *p.m.*

Saturday, January 11th.

Association of Mining Electrical Engineers (South Wales Branch).—Visit to the Great Mountain Colliery, Tumble. Paper by Mr. S. T. Richards on "Electricity in Mines—First Aid."

Sunday, January 12th—18th.

Radio Week.

Monday, January 13th.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 3 *p.m.*

Institute of Transport.—15, Savoy Street, Victoria Embankment, London. Paper by Mr. A. Davies on "The Co-ordination of Transport."

Institution of Electrical Engineers (Western Centre).—Royal Hotel, Cardiff. Annual dinner. 6.15 for 7 *p.m.*

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Efficiency." (Opened by Mr. A. Morgan). 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Paper by Mr. H. W. Taylor on "Voltage Control of Large Alternators." 7 *p.m.*

Institution of Automobile Engineers.—Queen's Hotel, Birmingham. Paper by Mr. H. K. Whitehorn on "Petrol-Electric Vehicle Characteristics." 7 *p.m.*

Electrical Contractors' Association (Hastings Sub-Branch).—Lewcock's Restaurant. Ordinary meeting.

Tuesday, January 14th.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Ordinary meeting.

Institution of Electrical Engineers (North Midland Centre).—King Street, Leeds. Informal discussion on "Colliery Electrification" (To be opened by Mr I. Scott Mackenzie). 7 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—North British Station Hotel, Edinburgh. Paper by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by means of Thermal Storage." 7 *p.m.*

Paisley Association of Electrical Engineers.—Visit to Messrs. The Seedhill Finishing Co., Paisley. 7.30 *p.m.*

Wednesday, January 15th.

Overhead Lines Association.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Discussion on "How Far is Recent Criticism of Overhead Transmission Lines Deserved." 5.30 *p.m.*

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.

Institution of Electrical Engineers (Wireless Section).—Savoy Place, Victoria Embankment, London. Paper by Mr. H. A. Thomas on "A Method of Measuring the Overall Performance of Radio Receivers." 6 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel. Paper by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by means of Thermal Storage." 7.30 *p.m.*

Thursday, January 16th.

Institution of Electrical Engineers (Hampshire Sub-Centre).—University College, Southampton. Papers by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by means of Thermal Storage," and Mr. T. G. N. Haldane on "The Heat Pump—An Economical Method of Producing Low-Grade Heat from Electricity." 7.30 *p.m.*

Friday, January 17th.

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Domestic Hot Water." Speaker, Mr. C. H. Smith. 7.30 *p.m.*

Saturday, January 18th.

Association of Mining Electrical Engineers (South Wales Branch).—Cox's Café, Cardiff. Annual dinner.

Passing of Two Pioneers.

THIS week the British electrical world has lost two notable figures. Dr. DE FERRANTI and Mr. HENRY ALABASTER both died on Monday, the former at Zurich and the latter at his home in Surrey. To each in his different sphere of activity the electrical industry owes much, and their passing will be widely mourned. Mr. ALABASTER, who had attained the ripe age of 83, was chairman and managing director of the Electrical Review, Ltd., until a few months ago, and he remained a director of the company to the end, so that like Dr. DE FERRANTI, who was 18 years younger, he died in harness. Dr. DE FERRANTI'S pioneering and inventive genius has left a deep impress on British electrical engineering and manufacturing. He was the real originator of a "Brighter London" by his work in developing a satisfactory supply of electricity for lighting in the Metropolis.

S.W. England and S. Wales Scheme.

THE seventh and the largest of the electricity schemes yet submitted by the Commissioners to the Central Board was published on Wednesday. The scheme covers an area of nearly 18 000 sq. miles, and embraces important coal mining districts, seaports, china-clay districts and tin mining. At present there are 165 authorised undertakings in the area, operating between them 107 stations, and it is proposed by the Commissioners to reduce this number to eight "selected" stations, including new units in the neighbourhoods of Southampton and South Wales. Eleven other stations are suggested as "temporary" stations while Portishead and Upper Boat (Treforest) will supply the base load. The stations will be interconnected by a series of high pressure main transmission lines, designed in a series of ring mains, comprising 739 circuit miles of line and 25 transformer stations. Incidentally, it is interesting to note that the interconnection of the stations in the area will release for revenue earning purposes 180 000 kW of plant now kept as spare, representing in capital about £3 060 000. The scheme contemplates standardising the outputs of 20 undertakings at an estimated cost of £764 450, the two chief undertakings coming under such standardisation being the South Wales Electrical Power Distribution Co., and the Cornwall Electric Power Co.

Cost of the Scheme.

THE cost of the scheme to the Board for the erection of the transmission system is estimated at £4 163 484, while, in addition, there will be an expenditure by undertakers of about £1 934 360 in extensions. It is estimated that the full advantage of the scheme can be secured with a saving of about £1 383 506 on capital expenditure, up to 1936-7, as compared with the capital expenditure that would be necessary if the present system were continued. After this date the saving on capital expenditure would be progressively greater as compared with individual development. The Commissioners have outlined a provisional plan of working the stations, with the necessary estimates. These suggestions are of course tentative, since the working of the scheme, including the fixing of tariffs, is the responsibility of the Board, but, taking the figures as they stand, the Commissioners estimate that in five years there will be a saving to the undertakers in the area of about £1 390 475, or an average of roughly £280 000 per annum. Schemes have now been published covering 94 per cent. of the area and 98 per cent. of the populations of England and Wales, in addition to Central Scotland. The East England (Norfolk and Suffolk) scheme is in hand, completing England and Wales, but North and South Scotland have still to be dealt with.

Menace of Higher Taxation.

ON Monday the board of directors of the Manchester Chamber of Commerce passed a resolution expressing the apprehension which is generally felt by British business men regarding the uncertainty concerning the policy of the Government in the forthcoming Budget. The resolution emphasised the profound conviction of the board that rigid economy in national expenditure is more than ever necessary to-day, and pointed out

Digitized by Google

that the fear of fresh burdens of direct taxation being imposed is undermining confidence in the future. It is impossible to overstress the importance of this matter. British industry and trade have been struggling to recover their former position in the world under a load of taxation such as none of our competitors has to carry. Several times since the war we have seemed to be on the point of making a real advance, only to be forced back by some fresh adverse circumstance. A year ago the outlook appeared moderately reassuring, but the spring brought the first tremors of the series of financial crises which was to shake confidence more and more as 1929 unrolled itself, and the result of the general election was another disturbing factor. Seven months' experience of Labour government has not been calculated to assist the recovery of confidence in the outlook. Large fresh commitments involving a heavy and annually increasing drain on the public funds have been the only contribution towards the solution of the problem of unemployment which Mr. MACDONALD'S administration has yet produced. The first instalment of the bill has still to be presented to the taxpayer, who has good ground for viewing the prospect with serious misgiving.

The Last Straw.

MEANWHILE in Europe and North America there is quite a different story to tell. The German Government is planning a 25 per cent. reduction of income tax, to be remitted in three stages during the next three years. Taxation in France is being reduced by £22 000 000, in Italy by £5 500 000, and in the United States it is proposed to decrease taxes on incomes by £32 000 000. In Norway and Sweden also reductions of taxation are foreshadowed. It is a disheartening contrast to turn back to contemplate the position in this country. While Mr. THOMAS is looking to the City to provide the means of reconstructing and reviving depressed industries, the Government, of which he is a member, is following a financial policy which is anything but an inducement to the investor to supply fresh capital for undertakings which will have to bear the brunt of the additional taxation that is threatened. Lower taxation would be the greatest stimulus to British trade and industry that could be devised ; conversely, an increase in the heavy existing burden would, in many cases, prove to be the last straw.

Our Overseas Trade.

BRITISH electrical exports during the year 1929 increased by £1 213 311 when compared with 1928, the respective totals being £19 534 706 and £18 321 395 ; imports, on the other hand, by the same comparison advanced by £1 957 862. The Board of Trade Returns, details of which are published on another page of this issue, show that during the year just closed exports of electrical machinery tended to fall off when compared with 1928, whereas imports of similar machinery increased. The year's favourable trade balance of exports over imports was £11 134 777 and though this is a little less than the balance in 1928, it should be borne in mind that prices have been lowered during the past year. It is therefore quite possible that though the trade balance of 1929 was slightly less in cash value than that of 1928, the volume of shipments of goods during the year was well in advance of 1928. Further, 1929 was, so far as this country is concerned, marked with many manufacturing difficulties, such as the severe frosts of February and March and the drought of the summer. Both these climatic features tended to slow up the heavy electrical industry, the first by making transport extremely difficult, both here and on the Continent, and the second by depriving many works of their usual plentiful water supply. On the whole, the electrical industry may be said to have made the most of the year just closed and, though imports increased during that period, the fact that the increase was largely made up of raw materials, makes it possible to attribute such advance mainly to increased manufacturing developments in both the home and export markets.

Electrical Trade with Australia.

WE have from time to time drawn the attention of electrical manufacturers to what would appear to be neglect of the Australian market and make no apology for again referring to the subject. The importance of the Australian market on the other hand justifies what ever publicity we may be able to bring to bear upon it with a view to improving the position. Electrical goods shipped from this country to Australia during the year ended June last declined in value by over £1 000 000, and the unfavourable economic conditions in the Commonwealth will probably cause a further downward tendency in the current year. This drop in British imports into Australia is, however, not confined to the electrical industry, and it is very unsatisfactory to learn that over 60 per cent. of Australia's imports in 1928–29 emanated from countries other than the United Kingdom, indicating all the more clearly the tremendous scope for increased effort by British manufacturers. So far as the electrical industry is concerned our chief competitors are the Americans, and success has attended them largely because of the personal contact methods of selling adopted. The merits or otherwise of the American products we already know, and if the British manufacturing industry paid equal attention to the Australian market there is no doubt that we should have a different story to tell.

A Five-Day Week.

INDUSTRIAL circles are apparently waking up to the advantages offered by a five-day working week, for the executive members of no fewer than thirty trade unions met last week, under the chairmanship of Mr. JOHN BEARCH, of the T.U.C., and adopted a resolution requesting the General Council to press for a five-day week for all Government employees. In support of this resolution it is argued in trade union circles that a long week-end rest improves the efficiency and morale of the worker, and as a result the weekly output is not diminished. The idea of a five-day week is, of course, not new, and it may be recalled that BENN BROTHERS, LTD., the publishers of THE ELECTRICIAN, were pioneers in giving all their employees the whole of Saturday for recreation. The effect of this privilege on the staff is not only to inspire greater enthusiasm for work, but to indicate that the management has their well-being at heart. There are many firms which have an "every-odd Saturday-off" system, and these, although perhaps not bold enough at the moment to bring themselves into line with the five-day week movement, will, no doubt, do so in the not too far distant future.

S.W. ENGLAND AND S. WALES SCHEME.

Seventh Electricity Scheme to be Submitted to the Central Board—Nearly 18 000 Square Miles Affected—Eight "Selected" Units, Including Two New Stations.

THE seventh of the electricity schemes to be submitted by the Electricity Commissioners to the Central Electricity Board was published on Wednesday and is known as the South West England and South Wales Electricity Scheme.

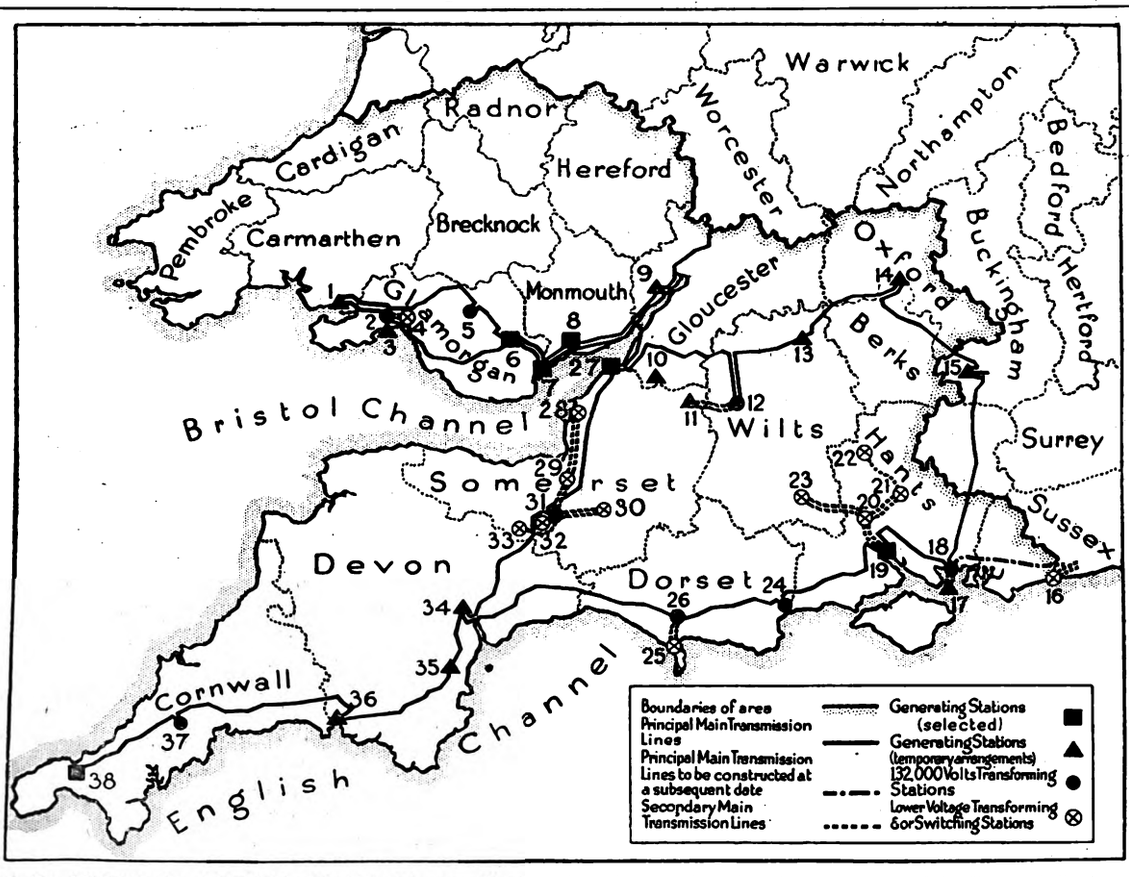
The aggregate maximum load on the undertakings in this area during the winter of 1927-28 was 207 156 kW, and is estimated to reach a total of 496 311 kW in the year 1935-36, being an increase of about 140%. By the winter of 1942-43, the aggregate maximum load is estimated to amount to 828 500 kW, or nearly four times the observed maximum load in the year 1927-28. It must be borne in mind that a considerable portion of the area has hitherto been without a supply of electricity; that many newly-authorised distribution areas are at an early stage of development; and that there is considerable scope for electrical expansion.

The sales of electricity to consumers in 1942-43 are estimated to reach a total of 2 188 million units, representing 359 units per head of population based on the 1921 Census. In view of the potentialities of the domestic demand for electricity in this extensive area, and allowing for the gradual accession to the public supply systems of demands hitherto met by privately owned generating stations, particularly in some of the colliery districts and other industrial parts of the area, the Commissioners have felt justified in allowing for the above increased rate of growth of output between the years 1935-36 and 1942-43.

It is not unreasonable to expect that the electrification of parts of the railways in this area, particularly in South Wales, will be carried out during the next ten or twelve years. No allowance, however, for railway traction requirements has been made in the estimates of output. The sources of supply and points of access to the transmission lines of the Central Electricity Board or of the larger undertakers are so located that supplies to the railway companies for traction and other purposes can be readily afforded when the necessity arises.

The large area to which the scheme relates comprises the whole of South Wales; the counties of Hereford, Monmouth, Somerset, Devon, Cornwall, Dorset, Wiltshire and Southampton; parts of the counties of Berks, Gloucester, Oxford and West Sussex; and the Isle of Wight; and embraces the whole or part of the areas of supply of 165 authorised undertakers. It is of interest to note that the extent of the area is about 17 090 square miles, as compared with areas covering from 5 000 to 9 000 square miles in the case of preceding schemes. The population of the last Census was approximately 6 164 880, representing an average density of about 360 persons per square mile, or less than half the average density of about 810 per square mile for the areas covered by the six previous schemes taken collectively. It includes densely populated areas in the coal mining districts; the maritime towns of Southampton, Plymouth, Falmouth, Bristol, Newport, Cardiff and Swansea; the growing industrial districts around Swindon, Bristol, Bath, Stroud, Frome, Melksham; the china clay districts in Cornwall and Devon; and the tin mining district in West Cornwall. There is an increasing tendency with the advent of cheap power to establish new industries in the southern portions of Great Britain, and this process should be facilitated by the recent authorisation of important distribution undertakings in this area for affording supplies to many towns which have hitherto been without any. While the Isle of Wight is included within the area, the scheme does not make any specific provision for the connection of the supply system in the island to the transmission system of the Central Board, the supply system within the island having already been approved by the Commissioners.

The cost of generation in this area in 1936-37 on the completion of the scheme will form approximately 81% of the total cost of the units delivered by the Central Board to authorised undertakers for distribution in turn to their bulk and other consumers. The remaining 19% represents the expenses incurred by the Central Board and includes the



Illustrating the S.W. England and S.W. Wales Electricity Scheme. **The routes to be taken by the main and secondary transmission lines are indicated, while the "selected" stations are (3) Treforest, (7) Cardiff, (8) Newport, (10) Portishead, (19) Southampton, and (38) Hayle The sites of two new stations have not yet been decided upon. The "temporary" and transformer stations are also indicated in the map, the numbers representing (1) Llanelly, (2) Swansea, (4) Neath, (5) Mountain Ash, (6) Pontypridd, (9) Lydney, (11) Bath, (12) Melksham, (13) Swindon, (14) Oxford, (15) Reading (16) Littlehampton (17) Portsmouth, (18) Fareham, (20) Romsly, (21) Winchester, (22) Andover, (23) Salisbury, (24) Bournemouth, (25) Weymouth, (26) Dorchester, (27) Avonmouth, (28) Weston-Super-Mare, (29) Bridgwater, (30) Langport, (31 and 32) Taunton, (33) Wellington, (34) Exeter, (35) Newton Abbot, (36) Plymouth, and (37) Summercourt.**

capital and other charges upon the Board's transmission system and their general administration expenses. These figures do not include any charges incurred on the standardisation of frequency, which have to be met separately.

A careful analysis was made of the technical and financial data applicable to each station in the area, taking into account the capital expenditure on the station and other standing charges as well as the estimated cost of future extensions in certain instances, so that the Commissioners could select those stations which are or are likely to become the most efficient and able to deliver the cheapest energy to the transmission system. The stations determined to be selected stations are :—Cardiff, (Cardiff Corporation); Hayle, (Cornwall Electric Power Co.); Newport, (Newport Corporation); Portishead, (Bristol Corporation); Southampton, (Southampton Corporation); Upper Boat, (South Wales Electrical Power Distribution Co.); representing six out of the 107 public generating stations now in operation in the south western area. The scheme also provides for the working, if necessary, of 11 other generating stations under temporary arrangements between the Central Board and the owners, namely the stations at Bath, (Bath Corporation); Exeter, (Exeter Corporation); Feeder Road, (Bristol Corporation); Llanelly, (Llanelly and District Electric Supply Co., Ltd.); Lydney, (West Gloucestershire Power Co., Ltd.); Moredon, (Swindon Corporation); Newton Abbot, (Torquay Corporation); Oxford, (Oxford Electric Co., Ltd.); Plymouth, (Plymouth Corporation); Portsmouth, (Portsmouth Corporation); Swansea, (Swansea Corporation).

Base Load Output.

In providing for the future demands in the area it is contemplated that the base load output will be allocated as far as possible to the selected stations at Portishead and Upper Boat; and that the remaining requirements will be met by the four other selected stations with the assistance of those worked under temporary arrangements.

While the scheme only provides for the operation as required of 17 stations for the purposes of the Central Board, it nevertheless contemplates that certain of the remaining public generating stations in outlying portions of the area will continue to be operated independently for the time being until by reason of further development it becomes economically practicable for the undertakers concerned to obtain supplies in bulk either directly or indirectly from the system of the Central Board. The stations of some 20 undertakers coming within this category contain at the present time only 5 800 kW of generating plant in aggregate, and in 12 cases the undertakings are likely to be connected up for bulk supplies within a reasonable time.

It will be observed that the scheme does not make any provision for the utilisation of electrical energy from any of the privately owned generating plants in the colliery districts of South Wales. When the transmission system is constructed, however, the Central Board may be able to effect suitable arrangements for the use of any surplus energy which may be available from such sources. It is contemplated that a new selected station will be required on the south coast in the south-east portion of the area by or about the year 1938, and that a second new selected station will be required in South Wales by or about the year 1940.

The scheme provides for overhead primary transmission lines to be operated at a voltage of 132 000 V between phases, the carrying capacity of each primary line covered by the estimates being not less than 50 000 kW. Ring mains have been regarded, as heretofore, as an essential feature in the design of the system and have been adopted (except for the time being in the case of the spur line from Exeter to Hayle) so as to afford alternative routes to points of supply. In the case of the old spur line to Cornwall, the extension of the Hayle generating station from time to time will provide the alternative source of supply to any of the "grid" points fed from that line. In determining the size of conductors for the primary overhead lines, regard has been had among other matters to the amount of power to be interchanged between selected stations; the amount of standby plant provided at each station under the scheme; and the necessity for running the most economical (base load) stations fully loaded at all times so far as the aggregated load curve for the area will permit, and for limiting the amount of load allocated to the less economical stations.

The scheme involves the provision of about 739 circuit miles of primary transmission lines, or one mile for every 1 280 kW of generating plant estimated to be installed in the area for the purposes of the scheme during the next 13 years. In the case of previous schemes, the amount of generating plant estimated to be installed during the same period per circuit mile of primary transmission line ranges from about 2 860 kW to 5 180 kW, with a general average of about 3 580 kW. The present scheme thus necessitates between two and three times the amount of primary transmission lines per kilowatt of generating plant installed, as compared with the average for previous schemes, this feature reflecting the greater extent of the area served and also its sparser character and generally lower stage of electrical development.

The transmission system for the south western area will eventually connect up through Reading, and possibly along the south coast also, with the system of the Central Board in South East England; and through Worcester with the system of the Board in Central England, thus becoming a contributory portion of the comprehensive system for Great Britain. The cost of the primary transmission system and transforming stations associated therewith (and of certain secondary transmission lines to be provided by the Central Board) is estimated to amount to £4 163 484.

While the transmission lines shown on the map and any further secondary transmission lines which may subsequently be constructed by the Central Board will constitute the means of affording direct supplies in bulk to the authorised undertakers connected to the system, various other secondary transmission lines which have already been or will be constructed by some of the principal undertakers in this area will also serve for the giving of supplies in bulk to other undertakers not directly connected to the Board's system. In addition, the various towns and villages in the different areas of supply will be served by networks of high tension lines for transmission and distribution which have been or will be constructed by company undertakers such as the South Wales Electrical Power Distribution Co., the West Gloucestershire Power Co., Ltd., the Llanelly and District Electric Supply Co., Ltd., the Bournemouth and Poole Electricity Supply Co., Ltd., the Wessex Electricity Co., the Cornwall Electric Power Co., the North Somerset Electric Supply Co., Ltd., and the Exe Valley Electricity Co., Ltd.; by municipal undertakers such as the Corporations of Southampton, Torquay, Bristol, Bath, Taunton, Exeter, Portsmouth, Gloucester, Cheltenham and Newport; and by other authorised distributors in Devon, Somerset, Dorset, etc.

Frequency Problem.

The Commissioners have come to the conclusion that it is necessary for the proper interconnection and working of the selected generating stations in the area that the frequency of the systems of the authorised undertakers in South Wales and Cornwall should be changed to the standard of 50 cycles per second.

The expenditure involved is materially less than that contemplated in other areas where standardisation has already been decided upon and is in process of being carried out. The estimated net cost of standardisation in the south western area when fully effected is £764 450.

It is estimated that by the end of 1936–37 the capital expended under the scheme on transmission and standardisation of frequency will be: By the Central Board: transmission lines and transforming stations, including capitalised interest, £4 163 484; standardisation of frequency, £764 450; by owners of selected stations: on extensions of existing stations (117 500 kW of generating plant plus equivalent boilers, together with additional boiler plant equivalent to 150 500 kW) £1 934 360, making a total expenditure of £6 862 294.

On the basis of individual development by the various authorised undertakers in the absence of the scheme, involving no standardisation of frequency, it is estimated that provision would have to be made by 1936–37 for further generating plant in new and existing stations amounting to 322 725 kW (inclusive of the above-mentioned figure of 117 500 kW) and additional boiler plant etc. to meet the load in the area and to allow for further immediate growth, representing an estimated capital expenditure of £4 085 900. To this figure there would have to be added further expenditure by certain of the company undertakers on main transmission lines, amounting to about £335 450, thus bringing the total expenditure in the area in the absence of the scheme to about £4 421 350. By the year 1936–37 a proportion of the existing spare plant in the several generating stations will have been released for revenue earning purposes under the scheme, such released plant amounting in all to about 180 000 kW and representing an original expenditure of about £3 060 000.

ELECTRIFICATION AND RURAL AMENITIES.

C.P.R.E. Deputation's Requests—Minister of Transport's Reply—Proposals for Collaboration—Control of Architecture—Unfairness of Singling Out Electricity for Special Restrictions.

REPRESENTATIVES from the Council for the Preservation of Rural England were received at the Ministry of Transport last week by Mr. Herbert Morrison, M.P., the Minister of Transport. The suggestions and recommendations contained in the Appendix to the Council's letter to the Prime Minister, dealing with the National Electricity Scheme in its relation to the safeguarding of rural amenities, formed the basis of the discussion. The deputation was headed by the Earl of Crawford and Balcarres, K.T. (President of the C.P.R.E.).

The deputation made it clear at the outset that they had no desire to place unreasonable impediments in the way of cheap electricity, and they submitted that power distribution can be achieved without disfigurement of the country provided the routes are wisely chosen and the works and buildings well designed, and that the present system does not ensure this.

Points Brought Forward.

They urged (1) That the Ministry of Health as the National Regional Planning Authority should be consulted in the first instance, on the utility side, the C.P.R.E. and C.P.R.W. as the guardians of rural amenity on the amenity aspect, and the Air Ministry with regard to the future provision for civil and military aviation requirements.

(2) That a really authoritative and impartial statement be issued by some disinterested scientist of repute as to what is and what is not "technically possible."

(3) That as there is a general feeling at present that wayleaves are being obtained on insufficient information as to the effect of the scheme on the locality, all schemes, whether of the Electricity Board or of local undertakers, should be exhibited in plan at a reasonable number of public places in the areas affected and that it should be an obligation on the undertakers to make their plans known in the first instance.

(4) That advantage should be taken of the existence of the C.P.R.E. Advisory Panels to obtain the assistance of architects who are conversant with local conditions.

(5) That the layout of transmission lines should not be left solely to engineers, but that they should be associated with regional planners.

(6) That before taking lines over commons, playing fields, National Trust properties and areas of great beauty which are peculiarly sensitive to disfigurement, enquiry should be directed to ascertaining (*a*) whether no practicable alternative route is available, and (*b*) whether injury could be obviated or minimised by carrying underground at least those stretches of the transmission lines which would pass over ridges or other prominent features of the landscape, or by insisting upon diversions so that the route shall follow depressions and not disfigure the skyline where the open space cannot be avoided.

(7) That the open sub-stations shall, where indicated, be surrounded by a suitable belt of indigenous trees.

(8) That in cases where glades have to be cut through afforested land for cables, masts or turbine pipe lines, the ground so denuded shall be replanted and every effort made to heal scars made by pipe lines on the mountain sides as in Wales.

(9) That regard be paid to the colour of insulators.

It was also suggested that the policy of erecting a small number of "super power stations" throughout the country was not economical on the ground of the great waste of our national fuel reserves and capital expenditure, and that the theory that power should be generated by burning fuel where the bulk of the heat can be most usefully employed might bear investigation.

In replying to the deputation, the Minister said that he would first of all like to thank them for the broad view that they had taken of the whole subject. It seemed to him that their aims and his were in essence identical. They were all agreed that the development of the country's resources must not be held up, and that this development should take place in such a way as to have the greatest practicable regard to the preservation of amenities. It was not open to him to give any general ruling as to the attitude he would adopt, but that he must consider each case on its own individual merits. He could, however, assure them that the question of amenity would always have due regard paid to it, and he instanced two recent cases in which he had refused his consent to overhead lines on that score.

As regards the national grid, the policy, recommended in the Weir Report and embodied in the Act of 1926, of generating electricity at a series of large and efficient stations interconnected with one another had been definitely accepted as the best technical practice. The suggestion referred to of relying on a series of small "waste-heat" stations did not accord with technical opinion, and he did not think that any good purpose could be served by an enquiry into the possibilities of this proposal. It must be taken that the national grid was to go ahead and in respect of these high tension main transmission lines he did not see any difficulty in arranging a certain measure of consultation with the central body of the Council for the Preservation of Rural England. He would propose that, as soon as the scheme for any area was available for publication, a copy should be sent to them by the Electricity Commissioners. This would give the Council the earliest possible notice of the general lay-out; the Central Electricity Board and the Commissioners would be ready to consider any representations which the Council might wish to put forward.

The schemes of local undertakers were in a different category. In these cases he did not necessarily know of the proposals until the undertakers applied to him for consent to an overhead line, and in many cases the undertakers completed their negotiations with the local bodies concerned so as to have the whole matter agreed before bringing it before him. In these circumstances it was impossible for him to deal with any bodies other than the elected local authority which had a definite statutory *locus*. He suggested that it should not be difficult for the local representatives of the Preservation Council to obtain information and to work through the ordinary Local Government machinery. Any attempt to give a semi-official *locus* to other bodies could only lead to inordinate and unjustifiable delays.

The Minister then pointed out that he had no power to control the architectural features of transformer stations and sub-stations, but he and the Electricity Commissioners did, and would continue to do, all they could to encourage a proper standard. Cause for complaint in this direction was not restricted to the electrical industry, and it was not altogether fair to single it out for special restrictions; it ought to be dealt with on a wider basis.

As regards greater attention being paid to the siting, screening and nature of construction of sub-stations, overhead lines, pipe lines, etc., he was in complete sympathy with the Council's views. He thought, however, that the undertakers, especially the better of them, already paid attention to these points, but he would be glad to co-operate with the Council in drawing up a circular on this matter which could be sent to all undertakers. In particular, this circular could press for the employment of an appropriate and competent architect in connection with buildings of any importance.

Recognition Difficulties.

The Minister informed the deputation that he did not think it was feasible to recognise regional town planning committees as bodies to be specially consulted on the question of overhead lines. As he had already stated he must deal with the elected local authority which had a statutory *locus* in the matter and was often the town planning authority, and in any case as constituents of the regional committees, could consult them on matters of regional planning if they so desired. The Ministry of Transport and the Electricity Commissioners were already in close touch with the Town Planning Department of the Ministry of Health and with the Air Ministry on these aspects of the question.

There seemed to be a rather exaggerated impression amongst some people that electrical development would involve a close network of lines covering the whole of the country. Such a picture was fantastic. Apart from the big structures of the grid, which were very limited in number, the ordinary rural transmission lines were not very conspicuous; in fact, many existing lines in rural areas generally escaped observation altogether.

OIL-FILLED ELECTRIC CABLES.

Their Design and Construction—Special Merits—How Oil Pressure is Maintained—Lower Cost—Multi-core Possibilities—Enormous Factor of Safety.

AT a meeting of the London Branch of the Association of Mining Electrical Engineers on January 7th, Mr. R. E. Horley, of the Pirelli General Cable Works, Ltd., read a paper on "Oil-Filled Electric Cables," Mr. J. R. Walton (Branch Vice-President) was in the chair.

Mr. Horley remarked that at the present time 132 000 V cables were being laid in London between Kidbrooke and Deptford, Wimbledon and Battersea capable of transmitting 80 000 kVA. To-day, underground cables could be manufactured for pressures as high as 220 000 V, although only a few years ago the highest voltage considered practicable was 22 000.

Heating up of Cables.

Three-core cable insulated with dried paper impregnated with a very viscous compound gave satisfactory service for many years up to 22 000 V, and it was thought that the same type of cable, insulated for higher pressures up to 33 000 V, would be equally satisfactory. In Europe and America many cables for this pressure were manufactured and laid, but after a time breakdowns became very frequent. The reasons for the failure were then obscure, and many authorities for a time abandoned the idea of transmitting power at such high pressures. As the result of considerable research into the problem it was ascertained that when a cable of normal construction and impregnated with the ordinary viscous compound is in service, the current heats up the cable. The comparatively large volume of compound held in the insulation then expands, and distends the lead sheath. When the cable cools down during periods of lighter loading, the compound contracts, but the lead sheath does not, so that spaces are left between sheath and cores. In time, compound drains out of the insulation into these spaces, resulting in the formation of voids within the cable insulation. If dielectric power factor tests are taken after the cable has been in operation for some time, the power factor is found to have increased, indicating change in the degree of impregnation of the insulation. Electric breakdown or discharge across voids or spaces in the cable results in the production of a waxy substance, the generation of gases including hydrogen and the formation of water by chemical combination. Although the waxy substance has been found to have excellent insulating properties, the formation of water is, no doubt, one of the chief causes of cable deterioration. Again, the low mechanical pressure to which the dielectric is submitted, especially when the load is off, leads to a low dielectric strength and consequently possible breakdown. In addition, the gaseous films, especially when the mechanical pressure is low, are highly ionised and build up conductive laminæ which produce distortion in the electrostatic field along the surfaces of the paper tapes. At high stresses it has also been found that gases migrate through the paper sheets under the action of the ionic bombardment and build up an ionised path in the direction of the stress.

These points have been studied with great care in the design of the oil-filled cable system. In this system, single cables are used so that the stresses are radial. The impregnating medium is a mineral oil of low viscosity, and the system is designed so that when the oil expands due to the increase in the cable temperature, the extra volume, instead of distending the lead sheath, is accommodated by means of external reservoirs which return the oil to the cable when it contracts during periods of lighter loading. The cable is thus maintained full of oil under all working conditions. The oil is fed into the cable through a central channel formed by stranding the conductors round a plain narrow metal strip so that a cavity is formed at the centre of the core. This cavity is kept completely filled with oil by means of feeding tanks at a pressure which is maintained just above atmospheric pressure at all points in the cable. The oil used for impregnating the cable is clarified by passing it through a centrifugal machine and degasifying it. The degasifying of the oil is most important, having regard to the effect of gaseous films in a cable dielectric.

Owing to the preparatory treatment of the impregnating oil and the improved method of impregnating the cable, the stress per mm. of insulation that can be used with safety is about 50 % higher than the maximum stress that may be safely employed in cables of ordinary construction. The thickness of dielectric in oil-filled cables is thus considerably less than that of normal type cables.

The special feeding tank for dealing with the expanding or contracting oil is in effect a reservoir of certain capacity connected to the cable, and placed at a height above it in order to obtain the necessary hydrostatic pressure as determined from calculations upon the profile of the line. It is essential, however, that the oil in the reservoir shall not be in contact with the surrounding air in order to maintain it in its degasified condition, and, further, it must be kept practically at atmospheric pressure independent of the quantity of oil in the reservoir. These conditions have been fulfilled by constructing the reservoir in the form of flexible walled cells made of corrugated nickel plates, the number and size of the cells depending upon the amount of oil required for the operating conditions in the cable at the particular point. A number of tanks may be paralleled together by means of valves and manifolds to give the necessary volume of oil.

It has been determined that the pressure at any point within the cable must not be allowed to drop below atmospheric and, therefore, the length of cable that may be fed from one source is limited. The length of section, however, may be considerably increased by installing a pressure tank, its function being to assist the feeding tank in providing accommodation for expanding oil and returning oil to the cable upon cooling. It differs in principle from the feeding tank in that it does not depend upon gravity for its action, and, therefore, need not be placed at a height above the cable. The size of the pressure tank depends upon the two following considerations: (1) When the cable is cooling down; how much air imprisoned in the cells of the tank must there be so that its increase in volume between its normal static pressure and the minimum pressure required to send oil to the farthest point fed from the feeding tank will be equal to the volume of oil required by the length of line the pressure tank is feeding? (2) When the cable is heating up; how much air in the cells is required so that starting at the static pressure the tank can accommodate the excess oil due to expansion of oil in the cable without being compressed to a higher pressure than the safe maximum working pressure of the tank?

Whichever of these two calculations gives the higher result decides the size of the tank used. With regard to the cost of the system, in spite of the expense involved in the oil-feeding accessories, the total cost is less than that of a normal cable capable of transmitting the same amount of power owing to the fact that it is possible to transmit much greater loads with safety.

Discussion.

Mr. S. Austin Stigant asked what provision was made for taking care of the expansion set up in the cable itself as the result of variations of load. Further, he said he had not yet seen any references to the application of the oil-filled system to multicore cables; were there any inherent difficulties in applying it to such cables? He also asked to what extent the introduction of the hollow-core oil-filled cable increased the current-carrying capacity, and to what extent, if any, the dielectric stress on the cable could be increased by virtue of the larger diameter of the central core? Had difficulties been experienced arising from the sludging of the oil in the hollow core? Mr. F. Heppenstall, discussing the problem from the users' point of view, referred to the reliability of oil-filled cables. The oil-filled cables in America, which would carry 100 000 kW at 132 000 V, were the largest cables in the world when they were put into operation. The power company which had installed them was liable to a penalty of $400 for every minute during any cessation of current and there was no spare cable. Those facts were sufficient testimony to the reliability of 132 000 V oil-filled cables. Another attribute of such cables was that they were extremely robust. He believed there was no reason why oil-filled cables should not operate at any temperature up to 80 deg. or, possibly, 100 deg. C.

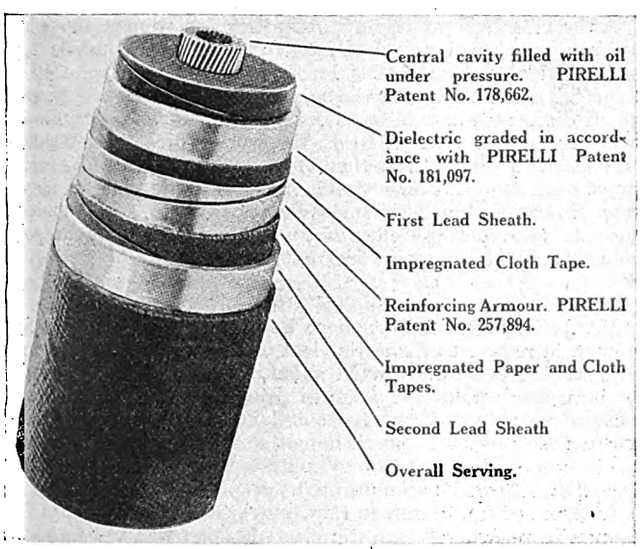
Mr. A. F. W. Richards asked what oil was used for the cables, and whether any provision was made for the heating of the oil containers? Even in this country we experienced variations of temperature from zero Fahrenheit to probably 140 deg.

Digitized by Google

Fahrenheit in the sun ;- did these variations affect the viscosity of the oil sufficiently to upset the balance ?

Mr. J. R. Cowie (Branch Hon. Secretary) said that the pressures exerted on a terminal sealing bell or an ordinary end box could be surprisingly high. Figures put before him had shown that the pressures on terminal end boxes varied from 80 to as much as 400 lb. per sq. inch. One of the main problems was what would be the pressure on the end joints or end boxes or sealing bells at the points at which the cables were joined up with other apparatus. It had been found that an oil which was shown to possess a reasonably high dielectric value when tested by the well-known methods might contain a dangerous percentage of moisture. Were special precautions taken to ensure that the oil used was reasonably free from moisture ?

Mr. Horley, replying, said that in London the oil-filled cables were laid in the familiar triangular formation, but did not remain in the same relative positions throughout the whole of the length between joints. Over part of the route the top cable was laid over against the bottom cable and was then brought back to the original relative position before the



An oil-filled cable, cut to show details of construction.

next joint was reached. Each cable was treated in that way so that there was a definite amount of slack between any two joints, allowing scope for expansion. He did not consider that this precaution was really necessary. There was no reason at all why multi-cored cables of the oil-filled type should not be made. In fact, there was a 60 000 V oil-filled three-core cable working in Milan. This was an ordinary belted type cable, but the oil channels were formed in the lead sheath itself, between the belt and the lead. The joints were of the ordinary straight-through type. It was working quite satisfactorily. So far the attention of his company had been concentrated upon 66 000 and 132 000 V cables, and if cables of that type were made with three cores the diameters would be greater than those of single-core cables, and the lengths of cable which could be handled would be shorter, so that the number of joints would be increased. In America three-core cables of the oil-filled type were used even down to 11 000 V.

The extent to which oil filling increased the carrying capacity of cables obviously varied with the size of conductor, but in the normal type cable the temperature rise accepted was usually about 30 deg. C., starting at 15 and rising to a maximum of 45 deg., some makers claiming that they could deal with a temperature of 50 deg.; but an oil-filled cable could deal with a temperature rise up to about 60 deg., so that there was a wide margin. The specification for the London installation had demanded heat cycles up to 100 deg. C. on cable laid in the ground. His company had carried out those cycles without trouble. With the apparatus at their disposal they could only go to 135 deg. C., and after that it was demonstrated that the cable was just as good as before. The oil containers were not maintained at a temperature of 100 deg. C. because if such large temperature ranges were used, the pressures to be dealt with would increase ; that would mean either the provision of much more apparatus or else the strengthening of the cable to a very large extent. Further, a certain amount of trouble would probably be occasioned in the joints. The jointers of oil-filled cables were given special training.

There was no danger of sludging of the oil, because sludging was caused by oxygen in the air. All the air was carefully removed from the oil-filled type of cables before they were laid and they were hermetically sealed. The oil used was a high-grade transformer type of oil, the best that could be bought.

Dielectric Stresses.

With regard to dielectric stresses, if we had erred at all, we had erred too much in the direction of safety. For oil-filled cables his company were using only half the amount of insulation used on the normal type cables. For a 66 000 V cable they were using only 8½ mm. of insulation. Such a cable, working at 66 000 V had a pressure to earth of about 38 000 V. They had carried out life tests at 160 000 V for 500 hours, and the cable had been totally unaffected thereby, so that the factor of safety was enormous. Life tests had been carried out on the 132 000 V cable at 350 000 V, and there had been long period tests also up to 400 000 V, so that there again the margin of safety was very great. They were of opinion that the normal type 132 000 V cable could be run at 220 000 V, and their 66 000 V cable could be run at 132 000 V. They were also making a 33 000 V oil-filled cable in which they were using 5 mm. of insulation, which contrasted with the 8½ mm. to be found in the normal type of cable.

The type of oil used had a freezing point of minus 30 deg. C., so that difficulties in regard to the oil would not arise when laying the cables during the winter. Because the oil was so fluid they could be bent to sharper angles than the normal type of cable. The cables were full of oil when wound on the drums finally and when being laid, and there was no fear as to the effects of bending. There was no heating of the containers, because the cold had very little effect on the oil. In calculating the size of tanks and the pressure they examined the oil at all temperatures at which the cables were likely to operate and at temperatures beyond the operating temperatures, and took into account the viscosity, because there was a moment during the cycle in which the pressures rose to a maximum. This occurred when switching on at about one-third full load.

With the oil-filled cables there was no difficulty in maintaining the terminals fully impregnated. If a terminal were near a large change in the profile of the line, they could put in a stop joint and a small pressure tank to take the pressure on the terminal. In America, experiments were carried out in which two or three lengths of oil-filled cable were connected to an experimental overhead line. These were shocked with voltages of 500 000 several times, and the cable was then dissected in order to ascertain if it had suffered, but it had not, and it was concluded that the factor of safety was enormous.

HYDROGEN-COOLED MACHINES.

Commercial Application in America—Wind Reduction Claims.

MANY and marked advantages are claimed for the hydrogen-cooling of electrical machines. The innovation is now stated to be definitely established upon a commercial basis and to have passed from the experimental stage into industrial practice. The General Electric Co. of New York claims to occupy a pioneer position in this respect, and according to the company's official organ, the "General Electric Review," for November last, windage loss is reduced upwards of 90 per cent, owing to the lower density of hydrogen as compared with air, the better heat conductivity of the lighter medium (7¼ times higher than air) facilitates the removal of 30 per cent. more heat by forced convection, there is considerable reduction in damage arising from corona discharges, electrical stress concentrations are eliminated, and oxidation of insulation being obviated, flexibility, and, with it, durability, of the insulations are maintained indefinitely. In the result a notable increase in output is secured, i.e., 30 per cent. at atmospheric pressure and 50 per cent. at 15 lb. gauge. Add to this, practically noiseless running and the fact that such machines are at once totally enclosed and waterproof, it needs little imagination to see that the vogue of the hydrogen cooled machine is one of increasing magnitude. Such cooled machines are, the makers claim, eminently suited for outdoor installation, and reference is made to the fact that machinery already in operation includes units of between 10 000 and 15 000 kW capacity, while orders for others are in hand.

WOMEN IN THE ELECTRICAL INDUSTRY.

Scope in Many Directions—Educational and Training Difficulties—Opportunities in Rural Electrification—Design of Domestic Apparatus.

AT a joint meeting of the London Technical Group of the Electrical Power Engineers' Association and the Electrical Association for Women at the Institution of Electrical Engineers, London, last week, a lecture was given by Miss C. Haslett (Director of the Electrical Association for Women) on the prospects for women in the electrical industry. Mr. P. Rycroft (Chairman of the London Technical Group of the Electrical Power Engineers' Association) presided.

Miss Haslett said that the electrical industry seemed to her especially to offer women interesting scope for employment in many directions. A few women had achieved distinction as electrical engineers, but for some years to come she thought there would be only a comparatively small number who would train fully as engineers, although there were undoubtedly many directions in which women so trained could be of practical use to the industry. The difficulty of getting practical workshop or power station experience was still great, and the fact that women were prohibited by law from working after 8 p.m. was also an obstacle. It was hoped in the next session of Parliament that it would be removed. Trained women, however, were now to be found in electrical works doing experimental work in connection with electric fires and similar apparatus; others were doing statistical and designing work.

A number of women had seats on boards of directors of small supply undertakings—one woman held the position of sales manager to a firm manufacturing electric tools and many were acting as secretaries and assistants to electrical engineers. With one exception, no woman held any responsible position in electrical publicity, although there should be openings in this field.

The fact that more women had not taken to the technical side of the industry was largely owing to two main reasons—(1) that engineering had not been considered, until recently, a suitable profession for women, and (2) that the general education of girls had not assisted them towards a technical or scientific career. This last obstacle was serious and had been discussed with the Board of Education with the result that some attempt was to be made to give girls training in electrical matters while they were at school.

It was in regard to the domestic uses of electricity that there was the greatest scope for the services of women, because all problems connected with domestic electrification were involved in problems related to household management and hygiene, and we were only on the threshold of the possibilities in this direction. More and more as the public were educated in the uses of electricity in the home there would be the need for women who themselves were highly trained. The successful women of the future would not need to train fully as an engineer but would need to have an everyday working knowledge of electrical terminology and electrical economics; above all, she must have the right kind of personality.

Training Classes

Every supply undertaking employing women should regard it as its duty to give its women employees opportunities for becoming as fully acquainted as possible with the technical side of the business so that they might answer all those queries which the consumer was apt to wrap in obscure language. It was a pity that in this country we had not evolved a better term than "demonstrator" or "saleswoman." She would like to see some term evolved equivalent to that used in America such as "director, home service department." Until the electrical industry offered more attractive salaries they would not get the best type of women to take up this class of work. Speaking of the type of work which women can undertake on the supply side, Miss Haslett specially mentioned canvassing houses and discussing the costs with housewives, and on the question of training for this class of work pointed out that the Electrical Association for Women had, in collaboration with the Ministry of Labour, begun classes for women at the Borough Polytechnic in electrical housecraft. In the matter of rural electrification also there was great scope for women's activities. The Women's Institutes throughout the country were becoming very interested in the question of domestic electrification and were demanding lectures and information. There would seem here to be scope for a woman attached to the supply authorities who could go out to the villages, before work was put in hand, in order to discuss with those in the neighbourhood the reason why overhead lines were necessary and the way in which co-operation might be secured in obtaining wayleaves. In this connection Miss Partridge had been doing valuable work and had herself trained a number of apprentices who were capable of wiring houses and explaining intelligently to the country folk the mysteries of electricity. There seemed also to be considerable opportunity for the use of electric caravans, staffed by one or two women, to travel about the country districts, giving lectures and cinema and lantern slide displays.

Another interesting opening for women was as electrical buyers in large retail shops. There were now one or two women so engaged and women who had a knowledge of the woman public could possibly buy to great advantage.

After reference to the opportunities for women in public work connected with electricity on borough councils and municipal committees, Miss Haslett emphasised the need of the electrical industry for the services of both men and women in all directions and pleaded for freedom for all individuals, whether men or women, to do the work which their training and abilities most fitted them for, without artificial restrictions. In the next few years many efficient women might emerge into the limelight in the electrical world, and we might also envisage the possibility of a woman Minister of Transport or a woman Minister of Electricity.

Discussion.

Mr. Jeffery agreed that there were many opportunities for women in regard to domestic electrification both in the towns and rural areas, and women should certainly be able to do an immense amount of work in regard to the design of apparatus used in the average small home. Much of the apparatus now in use in small homes seemed to be designed for use in homes where there was unlimited money and where the domestic help was also unlimited.

Alderman Mrs. Hammer (Hackney) said that the need for women in regard to domestic electrification was very urgent. Women liked to talk to women about anything domestic, and for that reason alone a woman would get ten orders to a man's one. We were lamentably behind in this country, and every home without electricity should be visited by a woman who could show the housewife what could be done by electricity. Such women should be properly trained and properly paid.

Mr. W. J. Oswald said he disagreed with the idea that there was some physical disability for women in regard to the workshop training necessary before the higher positions in the industry could be acquired. There was no doubt that women could qualify for those positions where the demand was not so much for practical as scholastic training. It seemed to him also that women could exercise a great influence upon the design of electrical apparatus for the home.

Councillor Mrs. Gregory (West Ham), in discussing the education of girls in electrical matters, said that women could be born engineers just as much as men could be born chefs, and it was necessary to discover if a girl had the ability and inclination to enter the electrical industry when she was 13 or 14. Mrs. Gregory added that she had an all-electric home and that one aim of her life was to see all other working women similarly situated.

Mr. Drew said that his firm made electrical instruments and some of the work was so delicate that it could only be performed by women. Some of their women employees were very clever, but the firm could not get them to go any further, and if the Electrical Association for Women could persuade girls to go in for some sort of technical training, the firm would welcome it. If the girls cared to study they might occupy good positions, and the firm would be only too pleased to promote them.

Miss Haslett, replying, said she was certain women were suffering from an inferiority complex because of their early up-bringing, but women had been as much to blame as anybody. As regards training, a course had been started that evening at the Borough Polytechnic for women who were not engineers but were secretaries to engineers, inspectors of factories, etc., or who held other positions where a knowledge of a technical side would help them towards promotion.

IMPORTANCE OF COLOUR IN LIGHTING.

Two Aspects to be Studied—Reflection and Translucence—Illumination and Decoration—Possibility of Attaining Perfect Balance by Day and Night—Blending Fittings with Furnishing—Wide Choice Available.

By W. A. GIBSON MARTIN.

THERE is an ever-increasing demand for colour. Shop window displays, city streets, everyday clothing, places of entertainment, the homes of the people—all are a tribute to the insistent use of colour. Manufacturers are aware of the demand and research is urged forward in the endeavour to make goods attractive to the eye, and, therefore, more saleable.

Goods which apparently had reached saturation point in their own market were clothed in colour, and new uses were found for them. No wholesale house can afford to overlook the advantage of showing goods in a wide range of colour. No retailer dare overlook the tremendous opportunity which colour offers to allow him to hold old and attract new customers. To the electrician, who is so closely connected with the art of display and with the lighting and decoration of the home, a knowledge and appreciation of colour is imperative.

Colour must be studied by the electrician from two aspects. There is the appearance of colour as daylight falls *upon* it: and there is the appearance of colour as light is passed *through* it. As a colour scheme must be satisfactory from both aspects, the electrician is more concerned with the effect of colour than those business concerns which supply articles affected by one aspect only. The electrician, however, is deprived of certain valuable properties provided by black and white, which are not colours in the proper sense of the term, although they are extremely useful in giving brilliance or relief with certain combinations of colour. The electrician also, is deprived of the neutral colours grey and brown, both of which are invaluable in colour work. Of course, it is quite possible to give the effect of black, white, brown and grey as light falls *upon* an electric fitting, but there obviously cannot be a black light, a white light is unattainable with present incandescent lamps, and neither grey nor brown light would be satisfactory.

With the advance in colour-appreciation amongst the general public, there has arisen a craze for self-expression: unusual, not to say freakish, suggestions are often made which the electrician mindful of his professional reputation cannot carry out. Electricity is a substitute for daylight. Those who want harsh greens and solid blues in electric lighting do not fit green or blue glass in the windows through which daylight comes. They confine their efforts in this direction by merely "tinting" daylight, using a fine curtain net close to the glass. Therefore, in choosing a substitute for daylight, they should use colours which will provide a light as closely resembling daylight as possible, using suggestions of colour to bring the *appearance* of the fitting into harmony with the colour scheme without altering to any extent the light from the fitting.

The colour problems of the electrician are further complicated by the fact that light passing through fabric (as in the case of a totally enclosed fitting covered in cotton or silk) is quite different from light which passes through glass. If the source of light is totally enclosed in fabric, the result is a diffused light particularly sympathetic to the decorative scheme and to the eye. This method of lighting as applied to ballrooms was fully described in THE ELECTRICIAN of January 18th, 1929, when the principles underlying the use of colour in fabric fittings were given in detail. Light passing through glass is direct, as distinct from diffused light; and, as direct light is preferred at the moment for most purposes, the suggestions in this article refer to direct and not to diffused lighting.

Proper Use of Coloured Light.

As a general guiding principle, the dominating light for a colour scheme should be as similar to sunlight as possible, restricting the use of coloured lighting to small or auxiliary fittings as a means of decoration rather than as an illuminant. The amateur carrying out a blue and green colour scheme in a room with a south-west exposure would have blue or green light from the fittings, whereas gold, amber or ordinary bulbs are the only practical choice, a touch of blue or green being introduced in the decoration of the fittings in a way which will still allow plenty of gold or amber light to flood the room. When two or more warm colours are used together, it has been suggested that the light may be rose, for instance, or even wine colour, but, again, ordinary bulbs with gold or white fittings are necessary to give sufficient illumination. In rooms decorated in purely secondary or tertiary colours, the same method should be used for lighting.

Colours may be divided according to their relation to the primary colours, red, blue and yellow; or according to their order in the spectrum, red, orange, yellow, green, blue, indigo, violet; or according to their warmth or coolness, red, orange and gold being considered warm colours and blue and green being referred to as cold colours. The last is the most useful classification for modern colour schemes, and particularly for the electrician: as will be at once recognised, cold colours can be used to a very limited extent, and, even then, only for purposes of contrast or decoration.

High Level of Artistry.

Given sufficient light of gold, yellow or amber, illuminating the room evenly and thoroughly, the electrician can use other colours to bring up the decorative scheme to a high level of artistry. Wall brackets can be used to spread a soft red light on panels, to throw a blue light over a piece of furniture in red Chinese lacquer, or a delicate green light on a picture. Standard lamps may be used to brighten up alcoves, to repeat a colour-note in a corner, and to give a specially desired light on embroidered curtains. Lights may be concealed in cornices, plate racks and pillars, to bring out decorative details of carving. In designing a decorative scheme in colour, the house furnisher is compelled to compromise because of the difference between day and artificial light. A colour which is perfect in daylight does not appear nearly so effective after dark: a colour which is ideal in artificial light is crude in daylight. The electrician who has a knowledge of colour can avoid the necessity for a compromise: he can arrange the lighting so that the colour scheme is perfectly balanced by night or day.

The metal portions of electric fittings can now be had in almost any finish. Amongst new finishes there are Oriental red and blue, old ivory and green bronze. This opens up a new method of providing colour while still giving plenty of normal light. The Oriental reds and blues are just what have been wanted for Chinese rooms, for use with Eastern carpets and hangings, and for rooms with valuable Oriental curios, as well as for studies and libraries. Old ivory is a beautiful finish for ultra-modern rooms. Green bronze finish will harmonise with verdure tapestry walls, with the artificial silk fabrics which are now used for curtains, bedspreads and coverings. No longer will the metal parts of a fitting appear an anachronism.

In these days of universal colour-appreciation, the electrician is particularly well-equipped to meet the demands of the public. If that demand is studied, guided along the best channels from the practical point of view, and encouraged to develop along the right lines, the electrician will become something of an artist in the production of beautifully coloured lighting effects.

---

154 KV TRANSFORMER ORDER.

Twenty-five Units to be Made by British Firm.

WHAT is claimed to be the largest industrial transformer order ever placed in this country has been obtained by the HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD., of Walton-on-Thames. These transformers, comprising twenty-five units, have an operating voltage of 154 000 V and will, we understand, be the highest voltage power transformers so far manufactured in the country. The transformers have been ordered by the NORTHERN ALUMINIUM CO., LTD., of Bush House, London, and the value of the order is nearly £150 000. Tenders were invited from the leading Canadian and European manufacturers. The contract was negotiated and completed in London by Mr. W. V. Esperson, managing director, and Mr. D. S. Anderson, chief purchasing agent, of the Northern Aluminium Co., Ltd., and by Mr. W. W. Hughes, chairman and managing director, Mr. W. C. Kennett and Mr. H. W. Biskeborn, of the Hackbridge Electric Construction Co., Ltd. Mr. S. E. Clotworthy will be the electrical engineer representing the purchasers during the course of manufacture.

COST OF ELECTRIC COOKING.

Misleading Comparisons—The Case of Water-heating—Advantages of Electricity for Grilling and Roasting—Figures which should be More Widely Circulated.

By S. F. BICKELL, A.M.I.E.E.

CONDITIONS in the world of electric cooking are rapidly changing. Gone are the days when the chief engineer of a supply authority was able to handle personally the commercial side of the undertaking, together with the generation and distribution. To-day a new and important post has been created amongst the personnel of the utility company, the holder of which is designated " Consumers' Engineer."

The first duty of the Consumers' Engineer is to advertise his wares, and it may be well to consider carefully the advantages of electricity as a household servant, compared with alternative source or domestic power.

Relative Efficiency.

So much is said of the relative cost of cooking by gas and electricity that one is inclined to accept figures quoted without troubling to confirm or refute them. The gas authorities make much of the fact that a unit of electricity at 1d. provides only 3 410 B.Th.U.'s, whereas gas at 10d. per therm develops 100 000 B.Th.U.'s, or 10 000 for 1d. This is somewhat disconcerting until one begins to consider the relative efficiency of the two mediums, and in making a comparison it is manifestly unfair to select any one operation as symbolical.

It is frequently the practice, however, even within the electrical industry itself, to select one specific application for attention, such as the boiling of water or the heating of a room. This is just as unfair and misleading as to select, say, the relative overall efficiencies of ovens. For a true comparison identical houses should be considered, the one employing electricity, the other gas, for all lighting, heating and cooking.

Electric vacuum cleaners, bed warmers, fans, curling irons, or hair dryers, compared with similar devices operated by gas, have a relative efficiency of 100% to 0%. In other words, electricity is able to provide those amenities of life which other fuels cannot do, and the aggregate of these benefits from the point of view of labour saving, convenience, hygiene, added luxury, saving in decorations, and so forth, will be found heavily to outweigh those few cases wherein electricity falls behind when comparing actual fuel consumption per operation.

Placing these benefits on one side, however, and dealing solely with the question of cooking, we find ourselves faced by the generally accepted inferiority of electricity as a medium for heating water. Consider the results shown in Table 1. To boil two pints of water by means of an electric boiling plate costs 0·253d. and by gas 0·106d., with gas at 10d. per therm and electricity at 1d. per unit. These figures are used to show that the heating of water by electricity is uneconomical. Domestic cooking can be divided into three operations, namely, roasting (or baking), grilling, and boiling. The latter term is loosely applied to embrace the heating of water, but actually very little water is required to be boiled on the electric cooker. The average family requires approximately ½ gallon of boiling water per day per head for culinary purposes, which covers tea making, vegetable cooking and other uses. Three pints of this quantity represent " first-boil " operations, the remaining pint " second-boil."

From Table 1 we see that the comparative costs of gas and electricity are 0·212d. to 0·479d., showing a loss by electricity of 0·267d. But the ½ gallon of water referred to represents only 10% of the quantity of hot water required per head in the average middle class household. A fair approximation of the daily requirement of each member of the house is five gallons, and this water, heated to 180° F., for the purpose of washing up, baths and toilet, will cost 4d. where a storage tank is employed. The electric storage tank normally operates at an efficiency of 95%, whereas the latest type of gas geyser can only utilise 58% of the B.Th.U.'s delivered to it, without the same convenience. (A by-pass flame for the latter device consumes 200 c. ft. per month, and is therefore not often employed.) Electricity, therefore, costs only 2d. per day per head more than gas for all hot-water purposes. In comparison, an open coal grate and saddle-back boiler costs 6d. to heat 20 gallons to 190° F. with coal at 48s. per ton. Taken over the day, then, electricity is not such an expensive medium for heating water as is frequently assumed, particularly having regard to the cleanliness and convenience enjoyed. Certain gas companies even advertise a maintenance service whereby they clean and regulate burners weekly at 2d. each, thereby proving the necessity of such cleaning.

Turning to the matter of grilling we find that an electric grill of 1 500 W loading will perfectly cook 2 lb. of steak or 1½ lb. of chops in 12 minutes at a cost of 0·3d. A gas grill of 40 c. ft. per hour capacity costs 0·36d. for the same operation. Here is a saving, though small, in favour of electricity, but it must be borne in mind that the grill is the most obnoxious part of a gas cooker. At the same time the fat or dripping obtained in the latter case bears no comparison with that in the former. Actually the dripping obtained from electric grills in a restaurant is worth 3d. per lb., whilst that from similar gas grills is not marketable.

Turning to the subject of ovens we find much in favour of electricity. Foremost comes the question of meat shrinkage. It has been found empirically that meat cooked in an electric oven looses by shrinkage 5% to 10% of its original weight; by using a side oven and coal fire 15% to 18% is lost, and by employing a gas oven for the same operation the loss increases to 25%. In the case of the average family where a 5 lb. joint of beef at, say, 1s. 4d. per lb. is perhaps the usual roast, the cash value of the loss is as follows:

7½d. by electricity.
1s. 1¾d. by coal.
1s. 7d. by gas.

The extra loss by gas roasting over electricity is, therefore, 11½d., or, roughly, 2¼d. per lb.

It has frequently been said by competitors of the electrical industry that this saving in the case of electricity is merely water, and that it is of no value. But a joint to be properly cooked should be raised in a given time to a certain temperature, and at that temperature the same water content will be exhausted whatever the source of heat. It is foolish to contend that the sealing of the joint or the coagulation of the juices on its surface is a sufficient barrier to the passage of steam under pressure. The real test is in the consumption of the meat, and here we have an irrefutable superiority in favour of the electric method.

Now, to cook a 5 lb. joint by electricity the oven must be preheated for 20 minutes, consuming 600 W, and the meat must be cooked for 1½ hours, consuming a further 400 W, making a total of one unit.

With gas ten minutes is required for preheating in an up-to-date cooker with a burner capacity of 35 c. ft. per hour. This operation consumes 6 c. ft. Cooking continues for 1½ hours with a further consumption of 30 c. ft., making a total of 36 c. ft. for the operation. So that the relative cost for fuel is 1d. for electricity and 1·6d. for gas, a saving of 0·6d. in favour of electricity. Add to this the previously mentioned saving of 11½d. in shrinkage, and we have the surprising but quite accurate figure of 1s. total. Supposing the oven to be used only twice a week for roasting, there is an ample financial margin with which to meet the loss in the case of water heating.

Setting apart the acknowledged advantages of electric cooking from the point of view of hygiene, there is a real saving to the housewife on the score of cost. Figures of this nature should be widely circulated to refute the regrettable popular impression that electric cookers are more expensive to use.

ROUND THE JOBS.

The 2½ per Cent. Allowance—New Form of Sub-Contract Agreement—Payments on Account—Consulting Engineers—Lead-Covered Wiring Systems—Necessity for Conscientious Workmanship.

By "CONTRACTOR."

THE electrical contractor, entering into a sub-contract with a builder or main contractor on a job, is very much the under-dog in many respects.

In the first place, the electrical contractor is probably asked to tender by the architect; having tendered on what he considers, and may even have stated, to be a net price, his tender is accepted, and, in return, he gets a "Form of Contract" to sign—a form which was probably not in his mind when he drew his tender and in which he finds that, among other things, he is expected to allow 2½% to the main contractor, this percentage to be ostensibly to cover the use of ladders and scaffolding, whereas, in fact, it is nothing more than a sort of *pourboire* to the main contractor for having been good enough to follow the architect's instructions in placing the sub-contract with the electrical contractor in question.

Tenders Lost on Small Margins.

The correct procedure for the electrical contractor to follow, of course, when he finds himself faced with this condition, is to repudiate it; to point out that his tender was on a net basis, and to refuse point-blank to allow this 2½%. As, however, this course of action may land him into all sorts of discussions and disputes with the main contractor, with whom he wants to keep on good terms, he is apt to find himself taking the easier course of allowing this 2½%, and bearing in mind the name of the particular main contractor, so that the next time he tenders for a job when he knows this builder will be the main contractor he will protect himself against this 2½% deduction. Even in this, however, he runs a risk, for next time one or more of his competitors may not have so protected themselves against the 2½%, and many tenders are lost on a smaller margin than this.

Arising out of this it is interesting to see that a move has at last been made in the direction of procuring a more equable form of sub-contract agreement as between sub-contractor and contractor. A special committee of specialist associations has evolved a form of sub-contract which appears to me to be all that can be desired. Although it protects the sub-contractor on important points, such as that already touched on, it does not go to the other extreme and make conditions to which the main contractor could possibly take exception. It does specifically contract out of any obligation on the part of the sub-contractor to allow a percentage to the main contractor for any reason whatsoever.

Again, in the matter of payment on account, it is explicit and reasonable. For it states that the main contractor shall in every case give seven days' notice to the sub-contractor of his intention to apply through the architect for a payment on account, thus enabling the sub-contractor to make his application to the main contractor, so that this may be incorporated in the "General Certificate" for payment. As things stand at present it is much too common for the sub-contractor to make application to the main contractor for a payment on account only to be told by the latter that he will have to wait some time, as he, the main contractor, has just made application for payment on account, and has not incorporated any sum for the sub-contractor, not having heard from him that such a sum was due.

It remains only to ensure that this new form of sub-contract agreement is insisted on wherever possible by the electrical contractor. Of course, it will be difficult, and, at the start, there is no doubt that many electrical contractors will be bullied into taking the main contractor's form of agreement. The only way to emphasise to the main contractors the existence and the importance of this new form is for electrical contractors to be careful, in all instances where they are submitting a tender, to include a note, somewhere on the tender, to the effect that the tender is made subject to the conditions of the form of sub-contract agreement approved and issued by the Joint Committee of Specialist Associations. Then, when their tender is accepted, they must, as far as possible, stand firm on the sub-contract being drawn according to this form of agreement.

Many contractors I know are disappointed if a consulting engineer is called in to superintend the electrical work on a contract. Perhaps it is that they feel that their pride is injured by the inference that they themselves are not competent as engineers to look after the job. Perhaps it is that they feel that here is the addition of one more to the ranks of those who are out to get their pound of flesh.

I am sure that this is a very silly attitude to adopt from both these points of view. In the first place, the calling in of the consulting engineer does not reflect in any way upon the skill or the competence of the electrical contractor any more than the calling in of an architect reflects upon the skill of the builder. In the second place, although a consulting engineer is employed by the customer, his client, and must therefore keep the interests of his client at heart, it is fallacious to assume that the consulting engineer is, if I may use the phrase, on the side of his client over all technical points. As a matter of fact, in practice it is very often the reverse, and we find the consulting engineer getting the contractor's proposals adopted by the customer, where the latter would have been suspicious if the proposal had come direct from the contractor.

Again, in the matter of payments extra to the contract, the consulting engineer, though he naturally disallows extravagant charges, will usually succeed in getting a reasonable charge allowed where the contractor, if left to his own devices, might very probably fail. Again, from the point of view of the customer—and we must remember that the customer, who is holding the purse-strings, is entitled to some consideration—it is very valuable to have two opinions. The consulting engineer draws his specification. The contractor, perhaps, has a suggestion or two to make in modification of that specification and, if such suggestions are good, the consulting engineer will not turn a deaf ear to them. Finally, and this perhaps is the most important factor from the point of view of the electrical contractor, the latter conducts his negotiations and takes his instructions from someone who is fully acquainted with his work, and with whom he can talk technicalities and from whom he may expect lucid instructions. The writer believes that a contract carried out under a consulting engineer results in a better job and a better profit.

Of late there has been some correspondence on the subject of the safety of lead-covered wiring systems, a correspondence which culminated in a letter from the secretary of the Institution of Electrical Engineers pointing out that lead-covered systems have received the sanction and approval of the Institution, provided that they are carried out according to certain regulations. Now this is very important, because lead-covered wiring systems, from their apparent simplicity of erection, are more liable, in my opinion, to failure than any other system. Every amateur who wires his own house does it with lead-covered cables. What could be simpler than clipping up to the walls this easily-handled material? Many contractors, I believe, consider that a lead-covered job does not demand their most skilled electricians. The result is failure in all cases where the I.E.E. rules are not strictly followed.

Continuity of Sheath.

When erecting a screwed-barrel job, for instance, metallic and electrical continuity of the tube is practically assured, but when erecting a lead-covered job the continuity of the sheath, a matter of the utmost importance to the safety of the installation, is often neglected. Lead-covered wiring systems can only be considered satisfactory when they are erected by highly-skilled labour and with very conscientious workmanship. Anyone who wishes to read some sane views from a practical engineer on the subject of lead-covered wiring systems could not do better than refer to the recently-published book by D. S. Munro, entitled "The Practice of Electrical Wiring."

The Northern Ireland Ministry of Labour is holding an industrial lighting exhibition in the Employment Exchange, Corporation Street, Belfast. The exhibition, which opened on January 14th, and will conclude on February 1st, seeks to demonstrate that good lighting saves time, increases output, avoids eye-strain, promotes safety, facilitates supervision, and ensures a more contented staff. The exhibits deal with methods of attaining maximum lighting efficiency.

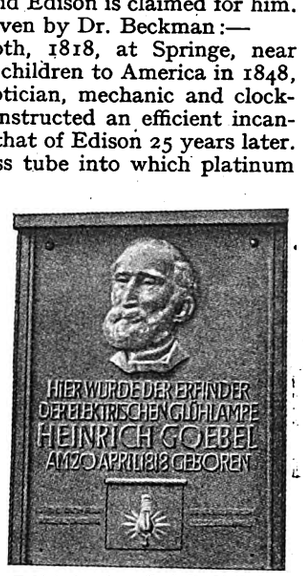
INVENTION OF THE ELECTRIC LAMP.

Claims of H. Goebel to Priority.

A BRUSSELS correspondent, M. Lionel Calisch, calls our attention to the claims of Heinrich Goebel to be regarded as the real inventor of the electric incandescent lamp. He sends a cutting from the Austrian "Radio Amateur" for December, 1929, comprising an article by Dr. H. Beckman, in which Goebel's work is briefly described and a priority of a quarter of a century over Swan and Edison is claimed for him.

The following particulars are given by Dr. Beckman:—

Goebel was born on April 20th, 1818, at Springe, near Hanover; went with his wife and children to America in 1848, and set up in business as an optician, mechanic and clockmaker. In the year 1854 he constructed an efficient incandescent lamp, closely resembling that of Edison 25 years later. Goebel's lamp consisted of a glass tube into which platinum wire was smelted to conduct the current into the interior of the glass cylinder. To this platinum wire was attached a filament consisting of a bamboo thread (as in Edison's lamp), which was brought to a glow by the electric current. A good vacuum was necessary, and this Goebel had already learnt to secure, while he lived at Springe, in connection with the making of barometers. He smelted to the lamp a glass tube about a metre in length, filled the tube with mercury and plunged it into a bowl containing mercury. When placed upright the flow of the mercury checked the atmospheric pressure, thus securing the vacuum in the lamp. Between 1855 and 1860 Goebel regularly exhibited his lamp in the evenings in the squares and streets of New York. The time was not ripe, however, for the sale and use of the lamp because a satisfactory supply of current was not available. Goebel died in 1893 in New York, and the Elektrotechnische Gesellschaft, Hanover, has erected a tablet to his memory, describing him as the inventor of the electric glow lamp, on the house in which he was born. The inscription reads:—"Hier wurde der erfinder der elektrischen glühlampe Heinrich Goebel am 20 April 1818 geboren."



Tablet placed on Goebel's birthplace in Hanover.

Our Brussels correspondent suggests that we should conduct an investigation of the claims of Goebel and "let us know the *real* inventor of the incandescent lamp." But, interesting as the subject undoubtedly is, we regret that we have neither the time nor the facilities for such an inquiry, nor would the result be decisive in any case. Probably a further search would reveal others on whose behalf claims could be maintained, for most inventions are the fruit of a long series of experiment by numerous investigators. There is no doubt that Swan and Edison are entitled to the credit of producing commercially successful lamps, though, as in the case of Adams and Le Verrier, the joint discoverers of the planet Neptune, their respective countrymen may never see eye to eye in regard to their respective merits. If Goebel preceded them, he was, like many another pioneer, unlucky in being ahead of his time, but in the interests of truth his name should not be forgotten among the "prophets of the dawn."

LITERATURE ON WATER POLLUTION.

The Department of Scientific and Industrial Research has issued "Summary of Current Literature on Water Pollution Research," No. 1, Vol. III, containing abstracts Nos. 1 to 119. These abstracts are made from the monthly summaries on the subject which have been issued by the Department since October, 1927, and further abstracts will be included in future issues of the Summaries. In addition to information which is of great value from the public health point of view, the abstracts contain much interesting matter relating to the treatment of water for boilers, the abstraction of water from reservoirs for electrical undertakings, etc. The price of the Summary is 1s. 3d. net, and it is published by H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, Edinburgh, Manchester, Cardiff and Belfast.

TELEPHONES AND RADIO.

World Position—Great Scope for Growth.

WRITING in the January number of the "Telegraph and Telephone Journal," Mr. W. H. Gunston estimates the number of telephones in use at the end of 1929 throughout the world at not less than 34 250 000—probably the true figures are considerably larger. At the end of 1927 there were 30 904 000, and twelve months later the number had risen by 1 740 000 to 32 644 000.

Distribution by continents at December 31, 1928, was as follows:—

Europe	9 185 000
Asia	1 205 000
Africa	205 000
North America	20 885 500
South America	491 500
Australasia and Oceania ..	672 000
Total	32 644 000

The European increase of 644 000 (7·5 per cent.) in 1928 was much the largest yet recorded. North America showed a larger numerical gain (906 000), but the percentage of growth (4·5) was lower than in Europe. From 1921–28 inclusive the number of telephones in Europe has increased by about 4 000 000 (77 per cent.) as compared with 6 500 000 (46 per cent.) in North America.

With one telephone to every 56 inhabitants, Europe falls far behind North America; but if the backward countries of eastern and southern Europe are excluded, the ratio for the north and west at the end of 1928 was 1 to 25 (Great Britain 1 to 25·8). In 1928 the position of the leading European countries in regard to rate of growth (with the percentage in parentheses) was:—

Austria (27); Russia (15); Belgium (15); France (9·3); Switzerland (9·2); Poland (9); Spain (8); Great Britain (7·6); Italy (7·5); Holland and Czechoslovakia (7); Germany (5); Sweden (4).

In Asia there are 840 inhabitants to each telephone, and in Africa 704. Japan (exclusive of Chosen, Formosa, Quantung and Saghalien), with 834 686, is far ahead of all other Asiatic countries, China with 130 000 (estimate) and India with 53 689 following at a remote distance, in spite of their much larger populations. The Dutch East Indies, with 49 398 telephones, were little behind India, although having only about a sixth of the population.

North America shows great disparity between the 6·6 and 7·2 inhabitants per telephone of the United States and Canada and the 221 of Mexico and 270 of Central America. In South America the ratio ranges from 41 in Argentina and 61 in Uruguay to 349 in Colombia and 427 in Peru.

The United States can boast of 157 cities with upwards of 10 000 telephones each, against Germany's 34, Great Britain's 18, and Canada's 15. New York alone had 1 702 889 at the end of 1928—not many short of the total number installed in Great Britain (1 759 686).

Comparing Great Britain with other principal countries of the Empire inhabited almost entirely by European races, we find the position to be:—

Country	No of inhabitants per telephone.
Great Britain	25·8
Irish Free State	110·0
Canada	7·2
Australia	12·8
New Zealand	9·6

Canada and Australia are ahead of the European country with the lowest ratio (Denmark, 10·8), and considerably ahead of Sweden (12·6) and Norway (15·3), being beaten only by the United States (6·6).

20 000 000 Radio Listeners.

Although broadcasting is only seven years old, as compared with the half-century or so in which the telephone has been at work, a recent estimate gave the number of radio receiving sets in use in the world as about 20 000 000, of which nearly half were in the United States and one-eighth in Great Britain. If in seven years the number of radio receivers in use can attain to four-sevenths of the number of telephones, in spite of the long start obtained by the latter, it would be rash to attempt to set limits to the growth of the radio manufacturing industry in the years to come.

BOOK-KEEPING FOR ELECTRICAL CONTRACTORS—III.

Cash and Stock Accounts—Day Book and Ledger—Analysing Credit Sales—Invoices and Returns.

By S. HOWARD WITHEY, F.C.I.

THE sales of the electrical contractor will consist of both cash sales and credit sales—that is to say, while certain instruments, batteries, generators, accessories, etc., will be supplied to customers in the shop for immediate cash, other electrical goods such as dynamos, cable, wire, belting, fans, etc., will be supplied subject to payment some time in the future. Both these kinds of sales will fall under the same general heading or headings in the periodical final accounts, but the method adopted for recording the original transactions in the subsidiary books will differ.

In applying the principles of double-entry, no difficulty will be experienced if it is borne in mind that money or value entering or coming into an account must be recorded on the left-hand or debit side of that account, and that money or value leaving or going out of an account should be entered on the right-hand or credit side of that account. As each cash sale will have the effect of increasing the contractor's cash or bank balance and of decreasing the stock, it follows that all such transactions will have to be shown on the debit or receipts side of his cash book, or cash account, and also on the credit side of the goods or stock account.

It will not be necessary, however, to make two entries in the books every time goods or articles are sold on a cash basis. Indeed, to do so would rapidly fill the cash book with a mass of comparatively small amounts each of which would have to be transferred or posted to the sales account. By keeping a cash sales or takings book each transaction may be entered and the daily totals recorded on the debit side of the cash book in a separate column provided for the purpose, or, as an alternative, the cash register records may be added up each day and the total entered in the cash book, providing sums paid in by credit customers are not included in these daily totals. At the end of each month the total of the cash sales columns should be posted to the credit side of a general sales account kept in the impersonal ledger, together with the date—viz., the last day of the particular month, and the words "By Sundries per Cash Book."

In those cases where the contractor wishes to ascertain the amount of gross profit made under each heading, it will be necessary to analyse the takings for posting purposes. For example, he may desire to know the total sales of electric bells, lamps, lighting sets and insulators, in order to determine whether or not one or more of these branches should be developed or suppressed. To ascertain these separate totals it would be essential to classify the cash sales records, and to enter in the cash book the amount of cash taken each day under those headings, the separate items being posted to the credit side of separate goods accounts bearing those names.

When electrical goods or articles of any description are sold on credit, the contractor's book debts will be increased and his stock decreased, consequently, in order to give effect to such transactions the personal accounts of the different customers should be debited with the amounts involved, and the goods or stock account credited. In practice, this is effected by recording each credit sale in a day book or sales book, and by transferring the selling price to the debit side of an account opened in the customer's name in the contractor's sales ledger. Each day book item should show the date of the sale, or the date on which the goods were actually despatched; the customer's name and postal address; and the number, quality, class and price of each different kind or brand. In addition to this information, the method of delivery could be stated, also any special terms or conditions which may have been agreed to. If no classification of the credit sales is deemed necessary or desirable, the monthly totals of the day book should be transferred to the credit side of the general sales account, with the date and the words "By Sundries per Day Book," the folio of the ledger being inserted underneath each day book total, and the folio of the day book against each ledger entry.

To be able to analyse the credit sales under two or more headings, it will be advisable to use a form of day book which has been ruled by the printers with a sufficient number of additional cash columns so that each amount recorded in the book can be extended under its most appropriate heading.

Two specimen rulings are shown, the first being suitable for ascertaining the total sales of motors and switches, and the second for determining the sales of wire, lamps, transformers, and fuses.

As soon as the details connected with a particular sales

DAY BOOK (Form A)

Date.	Invoice No.	Customer's Name and Address.	Particulars.	Ledger Folio.	Total.	Motors.	Switches.	Sundries.

DAY BOOK (Form B)

Date.	Invoice No.	Name and Particulars.	Details.	Ledger Folio.	Total of Invoice.	Wire.	Lamps.	Transformers.	Fuses.	Sundries.	Remarks.

Digitized by Google

transaction have been entered up and carefully checked over, an invoice should be made out and forwarded to the buyer. In this connection, while some electrical contractors prefer to type their invoices and to file carbon copies as a part of the slip system, others keep a press-copy invoice book, copies of all invoices being retained in this book. Unless authentic copies of the invoices are kept, it will be difficult, and in some cases quite impossible, to verify the accuracy of the original entries.

The number of goods and articles returned by customers will vary considerably in individual cases according to the volume of the contractor's turnover and the particular class of electrical products sold. Where the returns consist in the main of such things as wrong capacity circuit breakers, unsuitable terminals, or unsuitable grades of enamel, etc., and are not likely to be very numerous, they should be recorded at the end of the contractor's day book, where a number of pages can be reserved for the purpose. Each entry should give the date on which the goods, materials or stores were actually returned; the name of the sender; the quantity, number or weight of the returns; and the original selling price or allowance agreed to. If no analysis of the sales has been made, it will not be necessary to classify the returns inwards under their respective headings, and each item will be posted direct to the credit side of the particular personal account in the sales ledger, with the date, the words "By Returns" or "By Credit," and the folio, the monthly totals of the returns section of the day book being transferred to the debit side of the general sales account. But if the sales have been analysed under two or more headings, the returns should also be analysed under the same headings, but instead of posting the monthly totals of each classification column to the debit side of its respective sales account, they should be deducted from the corresponding monthly totals of the sales before the latter are transferred to the credit side of the sales accounts. Where the number of returns inwards is really considerable, and a sub-division of the office work is called for, it will be better to keep a separate returns inwards book or sales credit book, and the same applies to allowances made by the contractor in lieu of actual returns, these allowances being booked in exactly the same way, and corresponding with the details stated on the credit notes forwarded to the customers.

The copies of the credit notes retained by the contractor should not be attached to the respective invoices, but should be placed on a separate file and numbered in consecutive order with the entries made. At the close of each month's work, these forms can be wrapped up in a neat bundle and endorsed, leaving the file available for documents relating to the current month.

The next instalment of this series will show the correct method of keeping and balancing the electrical contractor's cash book.

(To be continued.)

CORRESPONDENCE.

Vacuum Cleaners for Hire.

[To the Editor.]

Sir,—Many housewives will shortly be turning their attention to the subject of spring cleaning, and, not unnaturally, the means of acquiring a vacuum cleaner either by purchase or hire will form one of the preliminary details which have to be considered.

Since many housewives are not able to purchase a cleaner outright, on account of the many claims upon the domestic exchequer, and since also many are still prejudiced against hire purchase methods, the advertiser of a vacuum cleaner daily hire service is looked upon as a friend in need.

Unfortunately for the domestic electrical appliances trade, the machines hired on such daily service are not up to the standard which the public has been educated to expect, with the result that an altogether erroneous opinion of cleaners is acquired. This is likely to become too general to be healthy.

It is within the writer's experience that many shopkeepers acquire second-hand electric vacuum cleaners solely for the purpose of the daily hire service. These machines in many instances have been thrown upon the second-hand market through old age or have shown some defect through mishandling.

These hire services, therefore, are doing irreparable harm to manufacturers, because, after such machines have been in use for some hours, a breakdown usually occurs and the particular machine or its trademark is then definitely condemned. Further, when such an unfortunate user discusses with her friends the mysteries of household cleaning she will not forget to air her views on vacuum cleaners in general, and XYZ's in particular, with the result that possible converts become positive detractors. They in their turn will also talk and the proverbial snowball will receive added speed.

As a remedy, might I suggest that electrical vacuum cleaner manufacturers approach such shopkeepers with a view to effecting the exchange of old machines for new ones, at the same time pointing out the infinite harm which such poor service can do to their own and the manufacturer's trade.

The position strikes me as being serious, and one which requires immediate action. With the large number of canvassers employed by vacuum cleaner makers, the names of offending shopkeepers could be quickly ascertained, particularly as the reputation of all cleaners is at stake, irrespective of type, make or nationality.—I am, etc.,

"Adsum."

London.

Generator Interference with Wireless.

[To the Editor.]

Sir,—Replying to "Q.'s" query: If he has one pole earthed a bank of condensers of about 10 m.f.d. directly across the brushes should do all that is required. The condensers should be connected as close to the brushgear as possible. If both poles are insulated from earth he should use two banks of 10 m.f.d. in series with a centre tapping to earth as sketch.—I am, etc.,

C. Culmer Hodges,
A.M.I.E.E., A.M.I.Mech.E.

Dawlish,
January 10th.

BOOK REVIEWS.

Motorships of the World. Edited by A. C. Hardy. (London: Sampson Low, Marston). Pp. iv+132. 12s. 6d. net.

This register of the motor ships of the world is approximately complete up to July of last year. It contains a classified record of motor vessels in alphabetical order of names with particulars of owners, dimensions, main and auxiliary engines. A route map of the world's principal motor shipping routes and a short article on "Motorshipping and the Economics of Water Transport" are other features.

Übertragungstechnik. By Rudolf Winzheimer. (Munich and Berlin: R. Oldenbourg.) Pp. vii+233. 12 marks.

Within the last decade the transmission of speech and music with and without wires has assumed considerable technical as well as commercial and political importance. It is with the acoustical and electrical interrelations of speech transmission that the present book deals. There is definite need for a treatment of this subject, and, as Director of Telegraphs in the German Post Office at Munich, the author's work merits attention. The book opens with a short dissertation on the growth of broadcasting, with its combination of landline and ether transmission. Next comes a physical treatment of the acoustic problems of sound reproduction and the various electrical circuits and devices developed to deal with them. A mathematical analysis of linear, non-linear, phase and back-coupling distortion is given very lucidly. The reader here requires a working knowledge of the operational or complex algebraic methods of solving alternating-current circuits. Chapter II deals with general transmission theory over metallic lines in an orthodox manner familiar to those acquainted with telephone technology. The conditions for distortionless transmission are developed. The author provides three excellent chapters on amplifiers and repeaters, and their arrangement and testing equipment. Chapter VI details the modified metallic line network linking up a number of broadcasting stations, and Chapter VII a short account of telephone cables. The book concludes with a chapter on the chief arrangements of sending and receiving equipment for radio telephony, with special reference to its interlinkage with landlines, as in the London–New York, Berlin–Buenos Aires and Holland–Dutch East Indies telephonic systems.

NEWS IN BRIEF.

Electrical Development in the Hedjaz—"Watts in a Home"—The New Telephone Instruments—Electrical and Engineering Wages—Morecambe's Showrooms.

THE Western Union Telegraph Co., announces that the company's fast cable between New York and Bay Roberts, Newfoundland, which was interrupted by the earthquake in November, has been reopened for traffic.

Mr. C. C. Catten delivered a lecture, entitled "Electric Light and Eyesight Preservation," to the Electrical Association for Women (South Wales and Monmouthshire Branch) at the Engineers' Institute, Cardiff, on January 7th.

The City Electrical Engineer of Hull suggests that the public buildings of the city should have a permanent installation of floodlighting to be used on appropriate occasions. The City Architect is to report as to the installation and maintenance of suitable floodlighting of the Guildhall.

The Senate of the University of London invites applications for the University Chair of Electrical Engineering.

Burton-on-Trent Transport Committee recommends the purchase of automatic traffic signals and warning signs, at an estimated cost of £606.

Eastbourne Electricity Committee is to ask the Housing Committee to allow for heating points in all future houses erected by the Committee.

Hull Hospital Committee has agreed upon a revised scheme for an electrical installation at Tilworth Grange at a cost of £610, and tenders are to be invited.

Morecambe Electricity Committee has obtained premises in Queen Street for electricity showrooms. Tenders for the fitting and decorating are to be obtained.

A new out-patients' block is to be erected at Burnley Hospital to accommodate a new electrical department and a new X-ray department, at an expenditure of £20 000.

Wakefield Education Committee has decided to re-wire and provide new lamps at the technical college and school of art and crafts at a cost of £360, plus cost of lamps.

Mr. W. Maurice, lecturing on "The Development of Miners' Electric Lamps" at the School of Mines, Treforest, said it was agreed that enhanced lighting in mines resulted in from 10% to 15% increase in output and a reduction of 2% in the amount of rubbish sent out.

It is reported that the Hedjaz Government is now studying schemes for the installation of an electrical plant midway between Jeddah and Mecca to supply both cities with electricity, to construct an electric tramway, and to provide harbour works at Jeddah and lighthouses and beacons along the Arabian coast.

The Bradford police box system came into official operation on January 8th. The 101 boxes, each with its own red signal lamp and telephone, will enable the police authorities to dispense with twelve district police stations. Every box is connected directly with headquarters at the Town Hall, and the signal lamps are to attract the attention of constables on their beats.

Following the recent decision of Carnarvon T.C. to take over the electricity undertaking from the National Electric Construction Co., the Council has decided to advertise for a manager at a salary of £350, rising to £450, and to retain the services of Mr. Price White as consulting engineer during the period of changing over—estimated at two years—at a fee of £250 per annum.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of January 17th, 1880, stated that Mr. Edison had set himself to construct a portable electric lamp (comprising a constant battery for supplying the current) which would be "no larger than an ordinary moderator lamp."*

Illumination of the coal hoists belonging to the Alexandra Dock Company at Newport was projected.

A correspondent suggested that the Hughes induction balance might be used for the detection of metals in the earth.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of January 20th, 1905, a description was given of the Fisher Street sub-station of the Metropolitan Electric Supply Company which, with a capacity of 3 000 kW from six 500 kW generators was said to be "the largest sub-station with rotary machinery running in this country."*

A forthcoming paper to be read at the I.E.E. by Mr. C. L. Addenbrooke, was on "The Value of Overhead Mains for Electric Distribution in the United Kingdom."

* * *

FIFTEEN years ago it was recorded in THE ELECTRICIAN *of January 15th, 1915, that the Hughes induction balance had been utilised in the location of bullets and shell fragments in wounded soldiers.*

The decision to electrify 1 880 miles of the Swiss State Railways was announced.

* * *

TEN years ago, in the issue of January 16th, 1920, THE ELECTRICIAN *criticised the lack of propaganda on behalf of electricity in connection with the attention that was then being given to housing problems.*

The Electrical Engineer has reported further to Barking Electricity Committee upon the scheme for the hire purchase of electric cookers. Consideration has been deferred as further information is to be obtained by the Treasurer.

Amongst the Royal Institution Lectures before Easter next will be one on February 6th by Dr. R. L. Smith-Rose on "Radio Direction Finding by Transmission and Reception" and a series on March 8th, 15th, 22nd, and 29th, by Sir Ernest Rutherford on "Atomic Nuclei and their Structure."

Glasgow Electricity Committee has considered a report by the Manager on a claim by the Electrical Power Engineers' Association for recognition of extra services and responsibility in connection with change of frequency work. The Central Electricity Board is to be consulted with regard to the claim.

The Electrical Association for Women play "'Watts' in a Home," will be performed at the Rudolf Steiner Hall, Park Road, London, N.W., on Tuesday, February 11th, at 8 p.m.

An offer by the Lancashire Electric Power Co. to instal and maintain an electric cooking stove free of charge at Chorley Grammar School and Technical Institute has been accepted.

The new type of telephone instrument, in which the receiver and transmitter are combined, will shortly be available for subscribers connected with automatic and the larger manual telephone exchanges.

At a meeting on January 22nd the executive committees of the engineering trade unions will discuss a proposal that the employers should be asked to establish national standard wages for plain time-rate workers.

The Chief Constable of Eastbourne has submitted a plan to the Watch Committee for placing illuminated signs marking the ends of the parking places. If such signs are fixed, drivers using such parking places will be permitted to extinguish their lights.

The Electrical Trades Union is pressing for an increase of the wages of men in the electrical contracting industry in London from 1s. 10½d. to 2s. an hour. The claim is mainly in respect of men employed on electrical contracts in building work, and does not affect the electricity supply industry, in regard to which the wages agreement was recently extended until the end of this year.

A "Financial Times" correspondent in Warsaw reports that negotiations with W. A. Harriman for the electrification of an important area in Poland are still continuing. The "Gródek" company, owning one of the greatest hydro-electric plants in Pomerania, has received offers from three foreign groups who wish to undertake the electrification of the western part of Poland. Belgian interests have subscribed to a new issue of capital of an electro-technical company in Warsaw.

A claim by the Association of Wireless and Cable Telegraphists for a revision of the wages and conditions of marine wireless operators was discussed at a conference with the Engineering and Allied Employers London and District Association (representing the wireless companies) in London, last week. Objection is taken by the operators to the method of fixing pay according to the tonnage of the ship. The conference was adjourned to a date to be fixed to enable the employers to consider the position.

PERSONAL.

SIR Alexander and Lady Roger have returned to England after three months' tour of India, Ceylon and Egypt.

Mr. Cyril Edward Lloyd has joined the board of Associated Electrical Industries, Ltd.

Barking Electricity Committee recommends the appointment of Mr. A. B. Catling as assistant engineer.

It is announced that Mr. C. W. G. Little, chief engineer to the British Electrical Federation is about to retire.

Mr. E. Marsden, electrical engineer to the Newmill Urban Council, has been appointed borough electrical engineer at Louth.

Miss Jean Cowan, daughter of Sir Henry Cowan, chairman of Measurement Ltd., whose engagement is announced to Mr. J. R. Barnes, the Lancashire amateur cricketer. Miss Cowan played cricket for her house while at Roedean School.

Personal estate of the value of £50 240 was left by the late Mr. Wm. Falconer King, electrical engineer, of Hunter's Quay, Argyll.

Mr. S. A. Pollock, chief of the G.P.O. research station at Dollis Hill, has resigned in order to take up a commercial appointment.

Coventry Electricity Committee recommends the appointment of Mr. W. J. Marston, assistant electrical engineer, as electrical engineer.

Southwark (London) B.C. Appointments Committee recommends the promotion of Mr. J. Holcroft to the position of station superintendent.

The Council of the Institution of Electrical Engineers has elected Sir Richard Tetley Glazebrook, F.R.S., to be an Honorary Member of the Institution.

Dover Electricity Committee recommends that the salary of Mr. R. W. Boorn, shift charge engineer, be increased in accordance with the schedule of the National Joint Board.

Mr. J. W. Robinson has resigned the position of President of the London branch of the Association of Mining Electrical Engineers, and Captain A. C. Sparkes has been elected in his stead.

Mr. A. M. Manighetti has been appointed continental technical representative for the Sterling Varnish Co., Ltd., of Trafford Park, Manchester, and is leaving England on January 20th.

Mr. C. L. Fisher, director of Hydro-Electric Securities Corporation, has been elected to the boards of the Standard Gas and Electric Co., and the Standard Power and Light Corporation.

Mr. G. G. L. Preece, until recently manager in the Manchester district for Bruce Peebles and Co., Ltd., of Edinburgh, has now been appointed to the position of sales manager for England and Wales.

Ald. A. Cook, a member of Fulham (London) Electricity and Lighting Committee, has been re-elected as one of the members on the employers' side of the District Joint Board, Electricity Supply Industry, Area No. 10.

Mr. Joseph Y. Shaw, for 31 years rolling stock superintendent to the Manx Electric Railway Co., has retired, and has been presented by the directors with a cheque and by the staff with an engraved gold hunter watch.

The marriage of Mr. George Frederick Farnfield, electrical engineer, of the Victoria Works, Victoria Road, Bexhill-on-Sea, and Mrs. L. V. Edwards, was solemnised at the Parish Church, Charing, near Ashford, Kent, on December 29th.

Mr. James Speight, who joined the Ormskirk Electric Supply Co. on its formation some 17 years ago and was latterly the engineer and manager, has retired. The undertaking was recently taken over by the Lancashire Electric Light and Gas Co.

The marriage of Miss Catherin Beatrice Birkett, third daughter of Mr. Robert Birkett, who was for 23 years borough electrical engineer at Southend-on-Sea, and Mr. Eric Rugg was solemnised at the Church of St. John the Baptist, Southend on-Sea, on January 4th.

Wolverhampton Corporation has agreed to fix the salary of the transport manager, Mr. C. O. Silvers, at £1 000 per annum, rising by annual increments of £50 to a maximum of £1 250. His present salary is £1 075. The salary fixed for the position of electrical engineer (now vacant) is £1 000, rising by increments of £50 to £1 200.

After 50 years' service with the Anglo and Western Union Cable Companies, Mr. T. O'Donoghue, who has been superintendent at the Western Union Cable Co.'s station at Penzance for the past ten years, retired on December 31st. At the annual dinner of the staff Mr. O'Donoghue was presented by Mr. J. V. Bentley, on behalf of the staff, with a piece of plate suitably inscribed.

Burnley Transport Committee has considered applications for the position of manager through the retirement of Mr. Henry Mozley, and has reduced the list to thirteen. These include Messrs. Charles E. Crossley, Chesterfield; Frank H. Crossley, Ashton-under-Lyne; Alfred S. Handsford Bristol; A. A. Jackson, Nottingham; E. H. Mason, Manchester; Sydney Mitchell, Newcastle; R. H. Nuttall, Luton; Cyril P. Paige, Wakefield; Arthur E. Scorey, Southampton; H. P. Sharpe, Rotherham; Charles H. Stafford, Reading; Charles Symon, Aberdeen; J. A. Wild, Lincoln.

Obituary.

ALD. T. RUSHTON, on January 9th, chairman of Leeds Tramways Committee.

MR. FREDERIC HUMPHREY BILLOWS, for many years superintendent of the Indo-European Telegraph Co.

DR. DE BOISSIERE, radiologist at several hospitals in France. He died at Havre, of radio-dermatitis caused by his work in applying X-rays.

MR. J. ALLWORK, aged 81 years. He was for many years a director of A. and C. Bridgland, Ltd., electrical and general engineers, of 33, London Road, East Grinstead.

MR. HAROLD ERNEST MEDHURST, aged 30 years. Mr. Medhurst was for some years engaged as an electrical engineer at the Rochester power house of the Kent Electric Co., Ltd.

MR. CHARLES GODFREY JAMESON, on Christmas Day. He was engineer and manager for the British Aluminium Co. at Kinlochleven. He was largely responsible for the Fort William hydro-electric scheme and died on the day originally planned for admitting the water to the Ben Nevis tunnel.

MR. H. ALABASTER.

WE regret to have to record the death of Mr. Henry Alabaster, a director of the Electrical Review, Ltd., who passed away at Sanderstead, Surrey, on Monday, after a brief illness (bronchitis). Mr. Alabaster, who was in his 84th year, was born in London in August, 1846. Early in 1874 he became interested in the "Telegraphic Journal and Electrical Review," which was started on November 15th, 1872, thus beginning a long lifetime's association with the electrical industry, to the development of which he made a substantial contribution. This connection was continuous until the end. His Jubilee was celebrated in February, 1924, by a dinner at which a presentation was made to him and Mrs. Alabaster by his co-directors, staff and employés. Mr. Alabaster was for many years in partnership with the late Mr. T. E. Gatehouse and with Mr. H. R. Kempe in the firm of H. Alabaster, Gatehouse and Co. and, on the formation of the business into a limited company (The Electrical Review, Ltd.) in 1919, he became chairman and managing director. He held this office until the autumn of last year, when he resigned owing to advancing years, continuing as a director until his death.

During a connection with the electrical profession and industry lasting for 56 years, Mr. Alabaster was interested in most of the movements affecting them. He became an Associate of the I.E.E. in 1887, and was one of the founders with Mr. T. E. Gatehouse and Mr. A. Izard of the Electro-Harmonic Society, which on its twenty-first anniversary presented these three gentlemen with souvenirs. For some years, Mr. Alabaster was joint-auditor with the late Mr. Sidney Sharp of the I.E.E. accounts. He was one of the founders and joint-secretary with Mr. A. M. Sillar of the Electrical Engineers' Ball, and was also an early member of the Dynamicables. Mr. Alabaster will be remembered as a generous subscriber to the Electrical Trades' Benevolent Institution and to various printing trade and other charities. In 1901 he presided at the meeting of electrical contractors held at Anderton's Hotel, at which the Electrical Contractors' Association was formed.

The funeral was held at Brookwood Cemetery yesterday, and a recent photograph of Mr. Alabaster is reproduced on page 79.

DR. FERRANTI.

TO Dr. Sebastian Ziani de Ferranti, who died on Monday at Zurich at the age of 65, is due, perhaps more than to any other, the credit of establishing the electricity supply industry as we understand it to-day. He was born in Liverpool, and from an early age manifested the liveliest interest in electrical science, and while at college at Ramsgate in 1877 designed, amongst other electrical apparatus, an arc lamp not unlike the Brush "clutch" lamp. At the age of 14 he commenced the construction of his first dynamo. His first practical working start was made when he obtained employment with Siemens Bros. and Co., at Woolwich, during the period when the Mackay Bennett submarine cables were being made. At the age of 17 he was deputed to erect and supervise the running of a temporary lighting plant at Wolverhampton when experience with such plant was in an experimental stage. About the same time he made a series of experiments with electric furnaces for Sir William Seimens. Ferranti's first patent was the zig-zag armature, and a company was formed in 1882 to exploit the invention, with Ferranti as engineer to the company at the age of 18. It was later discovered that Sir Wm. Thomson (afterwards Lord Kelvin) had invented a similar machine, and arrangements were made for manufacturing the "Thomson-Ferranti" alternator. The power developed by these machines was found to be enormously greater than anything previously obtained, and in 1883 Ferranti established the firm of S. Z. de Ferranti and Co., Ltd.

Grosvenor Gallery.

In the same year Messrs. Gaulard and Gibbs introduced into this country the Gaulard and Gibbs transformer system of distribution, and it was decided to light the Grosvenor Gallery by this system. Later came requests from neighbouring tradesmen for a supply of current, and these led to negotiations with Ferranti for extensions of plant, and in 1886 he was appointed engineer to the Grosvenor Gallery Co. A year later two 700 H.P. Ferranti alternators were put down and 36 000 lamps soon connected, generating plant being housed in basements of buildings adjacent to the Gallery. The difficulties of finding accommodation led Ferranti to select for his station a site at Deptford, and here was erected 10 000 H.P. plant with a 10 000 V distribution system. Building operations were commenced in 1888, and the capacity of the plant in the station was ultimately increased to 65 000 H.P.

Early workers in the electrical industry will remember the discussions (often heated, but always guarded in their condemnation, appreciation, or otherwise, of Ferranti's scheme) which centred round what was then described as the "Deptford experiment." The Electric Lighting Act of 1888 led to the abandonment of part of the original Deptford scheme, but not before the success of 10 000 V transmission was proved. At that time Ferranti was faced with a variety of problems in the solution of which there was no previous experience to guide him. He saw that for economical transmission he would have to employ a high pressure, and he chose 10 000 V. This for one thing involved him in the task of building a transformer that would step up the 2 300 V of his generators to 10 000 V. The difficulties under which he had to carry out the design were made worse by the fact that there were no instruments in existence which could measure so high a pressure, and he had to fall back on the makeshift of joining a hundred 100 V lamps in series, the transformer being judged to be giving the required 10 000 V when these lamps glowed with normal brightness.

A Cable Problem.

Another problem was to get cables that would carry the high-pressure current, and he was obliged to design and make these for himself. He employed concentric tubes of copper separated by brown paper impregnated with ozokerite wax, and as they were in lengths of 20 ft. over 7 000 joints were required in the 28 miles laid. The cables happened to be contrary to the Board of Trade regulations, but they proved quite satisfactory, and some of them were still in use 35 years after they had been put in place.

Dr. Ferranti was a past President of the Institution of Electrical Engineers and was awarded the Faraday medal in 1924. He was elected a Fellow of the Royal Society in 1927, and the University of Manchester gave him the honorary degree of D.Sc. in 1911. He was President of the British Electrical Development Association.

A photograph of Dr. Ferranti is reproduced on page 79 of this issue.

OVERSEAS TRADE.

Twelve Months' Exports Exceed Imports by over £11 000 000.

SHIPMENTS of electrical apparatus and machinery from the United Kingdom during December last amounted to £1 711 880, an improvement on December, 1928, of £276 442, and for the twelve months ended December, 1929, £19 534 706; an advance on the same months of 1928, of £1 213 311. Similar imports during last month amounted to £911 543, or £293 678 more than during December, 1928. For the twelve months of 1929 electrical imports were valued at £8 399 929, an increase on the 1928 return of £1 957 862.

Electrical exports during December exceeded imports by £600 337, while for the twelve months the excess was £11 134 777.

Export items, which showed improvement when compared with last year's return for the month of December include motors other than railway and tramway motors, increase £56 249; wires, other then rubber insulated, not being telegraph or telephone, increase £67 418; telegraph and telephone wires other than submarine, increase £41 626; submarine telegraph and telephone cables, increase £33 203.

On the import side items which contributed to the increased value during the month included electrical machinery, which by comparison with the same month of 1928, increased by £41 082; telegraph and telephone instruments by £9 461; electric glow lamps by £64 103; and electrical instruments by £118 332.

We give below figures for December, 1929, and for the year:

	Month of December		Twelve Months	
	1928	1929	1928	1929
	£	£	£	£
IMPORTS.				
Electrical Machinery	150 373	191 455	1 731 430	1 893 930

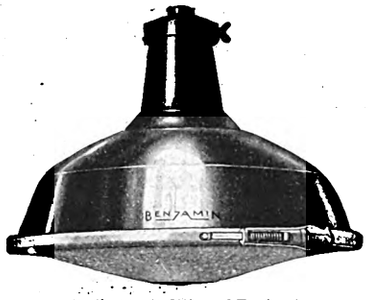
DOMESTIC ELECTRICAL APPLIANCES.

New Apparatus and Equipment of Interest to the Electrical Contractor—Shop Window and other Fittings.

DEALERS in radio accessories may be interested in the Ferranti electro-dynamic loud speaker, of which particulars have been supplied us by the makers, FERRANTI, LTD., of Hollinwood, Lancashire. The design of this speaker, it is stated, enables full advantage to be taken of the amplifying properties of the Ferranti A.F. 5 transformer. The speaker consists essentially of a light right-angle cone suspended in such a way as to allow a large amplitude of vibration, and fitted with a low-resistance coil which moves in the circular gap of an electro-magnet. Means are adopted permanently to centre the coil in the gap, so preventing the possibility of distortion through the coil moving laterally and touching the magnet. The intensity of the magnetic field is claimed to be considerably higher than is usual with most other types of electro-dynamic speakers. Under working conditions the pressure across the field winding is 230 V and the average flux density in the gap is 10 500 lines per sq. cm. In appearance the a.c. and d.c. speaker chassis are similar. Incorporated in the a.c. chassis are a mains transformer and a rectifying valve, with smoothing condensers, to provide the field winding current.



The "Visor" fitting of Benjamin Electric, Ltd.

The Ferranti electro-dynamic speaker employs a low impedance coil, which is light in weight and permits the use of a very small magnet gap. It must, therefore, be operated from an output transformer of fairly high ratio. The average impedance of the coil is, in fact, 20 ohms, and when used with a single output valve having an impedance of the order of 2 400 Ω the output transformer should have a ratio of 15/1, the OPM 3 being suitable. If two such valves are used in push-pull, a ratio of approximately 22·5/1 will be correct, and the OPM 3 c push-pull output transformer is recommended. The total energy consumption of the two types of speaker is as follows:—A.C. type SA1 . . 35 W. D.C. type SD1 . . 25 W. If the speaker is used in conjunction with the Ferranti all-mains receiver, model 31, no additional output transformer is necessary.

Increased attention is being given to the use of "artificial daylight" units, the latest of which to come to our notice is the "Benjamin Visor" produced by THE BENJAMIN ELECTRIC, LTD., of Brantwood Works, Tottenham, London, N.17. This unit falls into the class of those not claimed to give entirely true correction, but it is stated to give a close enough approximation to daylight to enable close and prolonged work to be carried out comfortably and with no fear of visual fatigue. It can be used for general lighting in coal-screening plants, laboratories, printing shops and textile factories—and in other places where, although accurate colour matching may not be essential, colour discrimination is important. The "Visor" artificial daylight unit is made in three sizes, for use with standard gas-filled lamps from 60 to 200 W. It consists of a Benjamin one-piece R.L.M. reflector with "Crysteel" enamelled finish, special blue-tinted glass front and a spring clip band with locking lever. The spring clip ensures positive tension on the band of the cover. and forms a dust-tight joint. A detachable top flange allows the whole unit to be removed from the flange and lampholder, to ensure ease of wiring.

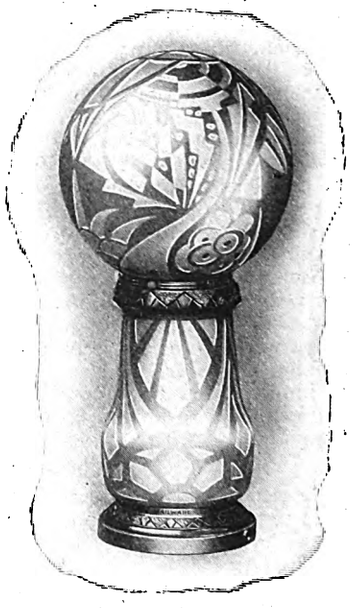
The new "H.B. No. 10" drink mixer is easily operated, durable and attractive to look at. It is marketed by S. G. LEACH AND CO., LTD., of 26, Artillery Lane, London, E.1. The user has merely to grasp the cup with one hand, slide it into position along the guiding column and the motor starts. The high speed of the motor, together with the "scientific agitator," ensures—it is claimed—the complete and rapid mixing of the drink, be it cocktail or malted milk. The upright of the mixer is normally finished in white porcelain enamel; it can, however, be supplied to order in jet black, jade green or ivory for a small extra charge. The enclosed type universal motor operates on 105 to 120, or on 200 to 250 V. The sliding contact switch is concealed in the upright. The agitator is silver plated. Accessories include the nickel silver cup, six feet of flex, adaptor, and a wooden box for packing.

The H.B. mixer No. 2 differs from the newer model in being somewhat more heavily built and also in being suitable for use with ordinary drink containers. Another useful H.B. product comprises an electric drink heater, which has a cup and a heating portion as separate units. The element is totally enclosed, the outside metal shell being nickel-plated, buffed and polished. The heater can be operated from any lampholder on 105 to 120 V, or 200 to 250 V, a.c. or d.c.

PHILIPS LAMPS, LTD., Philips House, Charing Cross Road, London, W.C.2, have given details of their latest output of lamps for projection work, cinemas, theatres, flood-lighting, etc. The Philips vertical tube type projection lamps, class A.1 (burning position: cap down), are rated from 100 to 1 000 W, and have a life of 100 hours. The standard voltages are 15, 30, 50; 100, 110 and 115; and 200-260. The vertical round type, class A.2 (burning position: cap down), have a maximum wattage of 1 500 and voltages from 100 to 115 and 200 to 260; the life is again 100 hours. Class A.3 comprises "end on" round bulbs with a life of 300 hours, rated for 100, 250 and 500 W. Epidiascope lamps—which, together with class A.2 can be supplied with silver mirrors at an extra charge—floodlighting lamps and standard projector lamps, class F, for 4, 6, and 12 V are also offered.

For attracting the attention of the public to shop window displays and at the same time eliminating the chance of the onlookers' eyes becoming tired, Messrs. Phillips are now recommending the "Philiray" reflector, which is made from crystal glass, highly polished on the inside and having numerous facets. On the outside of the reflector are two coats of silver protected by several applications of copper, which—it is stated—is electrically deposited by a new process. Finally the external surfaces receive two coats of aluminium. The design of the facets above referred to gives in effect an immense number of minute mirrors, ensuring a good reflection of light and an unusually arresting appearance. The firm gives a five-year guarantee against peeling, checking and tarnishing.

Those who are familiar with the advantage of "Supastone" glass will doubtless be pleased to learn that THE WHOLESALE FITTINGS CO., LTD., of 23, 25, 27 and 37, Commercial Street, London, E.1, have, as the result of numerous experiments, successfully developed artificial daylight units which utilise Supastone glass. The three-ply lighting glass of this name absorbs very little light, and the new "Da-Ray" units are claimed to produce a daylight effect with the minimum of absorption. "Da-Ray" units are stated to "produce a brilliant natural diffused daylight effect without glare" with an efficiency of 93%. Photometric tests are said to show an almost uniform distribution of light. The units are supplied in three sizes, with 8 in., 12 in., and 14 in. diameter glassware, the gasfilled lamps recommended being respectively up to 100, 200 and 300 W. The unit, an example of which is shown in our illustration, is dustproof and has polished surfaces which are simple to clean. The firm offers to supply a sample "Da-Ray" to any trader for a seven days' test.



A new design of fitting offered by Hailwood and Ackroyd, Ltd.

The GENERAL ELECTRIC CO., LTD., has now gone a step farther in the manufacture of electric irons by the introduction of a feature which provides a decorative touch. "Magnet" irons are now being manufactured with the domes finished in

Digitized by Google

blue, green or red enamel, the sole and handle support being in nickel plate. The G.E.C. have lately built and equipped at their works in Birmingham a new section for carrying out enamelling work in large quantities, more especially to cope with the vitreous enamelled parts of cookers and electric fires; the vitreous enamel finish of the coloured iron is thus able to be of a high standard. The finish is claimed to be impervious to changes of temperature; it will not show any tendency to chip or peel, nor will that unsightly discoloration be possible which usually takes place when a nickel-plated iron is carelessly used and overheated. They are made only in the 5 lb. size and packed in a neat black and gold box, with three yards of black circular flex and bakelite BC adaptor.

For many of the applications of the "Osram" photo-cell the new Osram photo-set should prove of considerable service. The unit comprises a one-valve amplifier, a standard Osram photo-cell and a 50-milliamp. relay. It has been designed and produced by the General Electric Co., Ltd. No external batteries are required to work the photo-set, resistances being so arranged that the supply mains, a.c., or d.c., provide both filament current and the positive anode potential to the amplifying valve. The values of the resistances are adjusted to allow the correct filament current to pass. The voltage between the anode of the valve and the filament is about 150. When no light falls on the photo-cell, a current flows in the anode circuit of the valve. As soon as light falls on the cathode of the photo-cell, the grid of the valve assumes a negative charge, and the anode current of the valve is stopped. This change of current through the operating coil of the relay closes a secondary contact, and lights up the indicating lamp. The change in current through the relay-operating coil is about 10 milliamps. The secondary contacts will carry about 50 milliamps.

Larger currents can be dealt with by a further relay circuit, in place of the indicating lamp. If the photo-cell current is as great as 0·1 microamp. the response will be very rapid when light falls on the cell. As the grid takes a short time to assume its original potential, the response is not so rapid when the light is turned off.

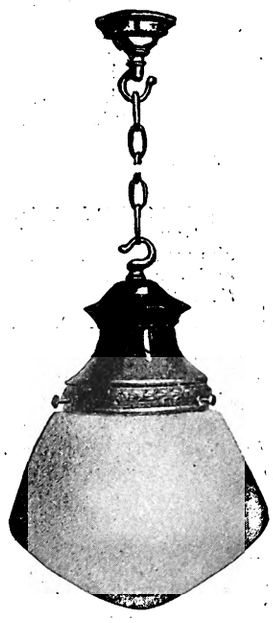
L. G. HAWKINS AND CO., LTD., 30-35, Drury Lane, Kingsway, London, W.C.2, have sent us particulars of "Peter the Heater" model No. 3. When the intense frosts of last year played havoc with unprotected motor cars, over 1 800 of "Peter the Heater," model 2, were put into commission, and with this encouragement the larger model 3 has been produced. The new model has the various popular points of the No. 2, and in addition, provides a portable inspection lamp with hinged wire guard protection. The light can be directed with considerable accuracy by a well-designed reflector, and the hook-shaped carrying handle (which is also used for hanging the heater under the bonnet of the car) is conveniently placed—while the top of the heater is recessed to provide a good refuge for such things as screws.

Moulded Accessories.

Until recent years, many electrical accessories were made of metal—not always because metal was a suitable material, but sometimes merely because a custom had developed. Apart from being a conductor, metal has the added disadvantages of being subject to corrosion from the polluted air of towns and the brine-saturated air of coastal districts, thus calling for continual cleaning. A substitute for metal which is claimed to provide most of its advantages and few of its drawbacks is "Jacelite" moulding, manufactured by J. A. CRABTREE AND CO., LTD., of Lincoln Works, Walsall. The firm produces lampholders in "Jacelite" moulding of three colours, and recommends them for all domestic locations where all-metal lampholders have formerly been used. They are offered as an improvement—in design as well as in material—over the metal type, but as they are not provided with protective skirts they do not comply with Home Office regulations for factory use. "Home Office" types are, however, also manufactured in various models, as in 2 454 for cab-tyre and workshop flex and 2 574 for ordinary flex. The high degree of safety of these skirted lampholders makes them desirable for some domestic locations.

A new enclosed lighting unit, known as the "Eralite" fitting, employing special glassware designed to give an illumination approximating to that of natural diffused daylight, has been put on the market by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., of 38-39, Upper Thames Street, London, E.C.4. The glassware used in this fitting has been designed to correct the light from the lamp, and the approximation to natural light is claimed to be of a high degree. By the use of "Eralite" units colours are seen virtually in their natural tones, and the general light effect is pleasing in character and lacking the coldness usually associated with filtered light. The fitting comprises a heavy gauge, spun, ventilated canopy with cast ornamental work, solid brass ceiling plate and Cash's chain.

An electric washer, known as the "Efesca Easy" washer has recently been introduced by FALK, STADELMANN AND CO., LTD., of 83-93, Farringdon Road, London, E.C.1. The washing is done by means of vacuum cups which are attached to tubes and work up and down at the rate of 60 times per minute. These vacuum cups, on striking and rising from the surface of the water, produce air pressure; every time the cups reach the bottom of the stroke they change position (twenty times per minute) so that every portion of the washing comes under their action. On the up stroke suction is created, and the clothes at the bottom of the tub are drawn upwards; thus each article is moved, and thoroughly washed—not only surface dirt, but also the dirt that is embedded in the meshes being quickly removed. The delicate operation of the cups makes it possible for the most flimsy lace or the most expensive fabric to be washed thoroughly, without fear of damage. The chamber adjoining the washing container is used for drying. It is composed of an inner perforated tank, with an up-to-date centrifugal dryer. The dryer can be packed with clothes, which, it is stated, will be "damp dried" ready for ironing or airing in three minutes. This operation is claimed to be more efficient than mangling, while buttons cannot be crushed or broken, and no creases will be formed in the washing. It ensures even drying, and all the water whirled out of the clothes is returned to the washing tub. The machine can be emptied either from the exhaust vent provided or from the draining board, as required, a pump being fitted for this purpose. A heating arrangement is fitted under the washing container to maintain the water at the correct heat during the various washing operations.



The new "Da-Ray" unit referred to on the previous page.

Another series of new fires which may be mentioned among the large number introduced for the winter season are those put on the market by ELECTRIC HEATING AND HARDWARE, LTD., of Crown Works, Berkley Street, Birmingham. In the ascending order of price these fires are known as the "Westminster," "Carlton," and "Beaufort." The Westminster is obtainable in silver nickel, antique brass and oxidised copper, or oxidised silver; like the other models, it has two elements, one is on the main, the other controlled by a special kick switch. The Carlton and Beaufort, which both belong to the firm's "Glowincoal" class of fire, have kick switch control for each or their two elements, smoke and flame effect, and all porcelain insulation. These three fires have parabolic reflectors of chromium, and are stated to be remarkable for the long heat beams emanating from such reflectors. The resulting high radiant efficiency is claimed to effect a saving in consumption of 25 to 33⅓%. Owing to this high efficiency the maximum loading has been reduced from 3 to 2½ kW. All elements are of the plug-in type.

A floor-polisher known as the "Hobby" is now being manufactured by THE WASHING-UP MACHINE CO., LTD., of 34, Fulham Road, South Kensington, London, S.W.3. It has a ¼ H.P. motor, driving three sets of brushes set triangularly—a worm on the motor shaft engages with helical gears on the three brush spindles. All the gearing is in an oil bath. The machine is provided with rollers, and during polishing these are put out of use by means of a lever operating a cam movement, which lowers the base of the polisher relative to the rollers. A cake of hard polishing substance is held down on the upper periphery of the brushes, so that polish is applied gradually and evenly all over the floor as the machine is systematically moved over the area. A very convenient type of switch is fitted, and our representative found the machine unexpectedly light and easy to manipulate.

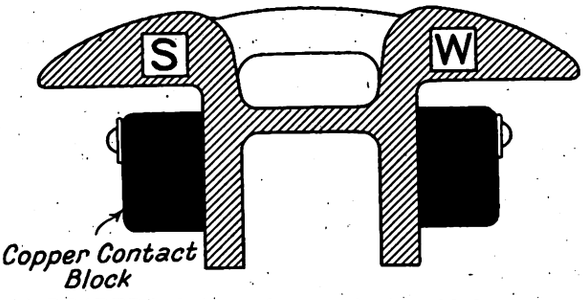
BUSINESS ITEMS.

IT is reported that orders received by the GENERAL ELECTRIC CO., of New York in 1929 amounted to $445 000 000, against $348 000 000 for 1928.

The HART ACCUMULATOR CO., LTD., Marshgate Lane, Stratford, London, E.15, recently entertained a party of officers of H.M.S. "Vernon" and explained to them at the works the various processes of "Hart" battery manufacture.



A READER is desirous of communicating with the manufacturers of the fusebridge, of which this drawing is an actual size resemblance. We are unable to trace the makers ourselves, and if any reader can assist us will he please communicate with the Editor?

CROMPTON PARKINSON, LTD., Bush House, Aldwych, London, W.C., ask us to point out that if any readers have one of this company's desk diaries in their possession and have not yet received a 1930 refill, application should be made to the address above.

We are informed by the "Typerlite" Co., 86, Cannon Street, London, E.C.4, that their "Typerlite" units for use with all kinds of office machines have been adopted by the Midland Bank. One-piece "Typerlites" for lighting office machinery have also been adopted at the head office of Barclays Bank Ltd.

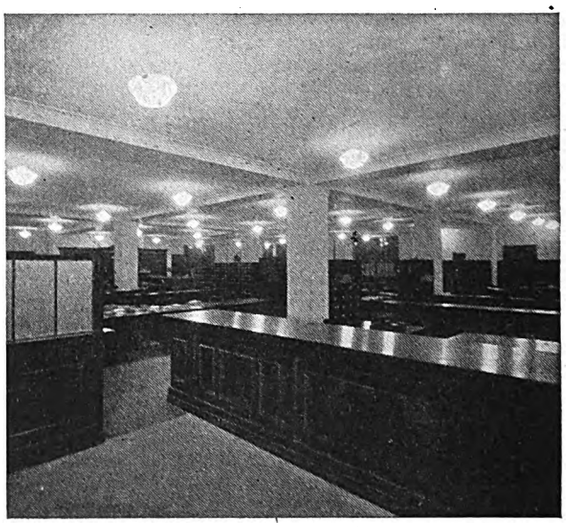
The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C., is identifying itself wholeheartedly with the Radio Week Campaign. The windows of the head office in Kingsway, and at the twenty three branch establishments throughout the country, have attractive displays staged of a representative range of the wireless products of the company. In addition, the company enlisted the aid of all those who handle these products, and many dealers are featuring G.E.C. goods only.

An electrical exhibition was held in the Y.M.C.A. Institute, Motherwell, during the annual Carnival from December 27th until January 4th, the difficult task of staging the display being achieved by Mr. W. D. Brassington, the burgh electrical engineer, and his staff. Among the attractions was a "Sun-Ray" apparatus and ozoniser by QUAIN SUNLIGHT LAMPS, LTD., and an instructive E.L.M.A. display of model room, shop and workshop interiors, showing correct and incorrect lighting. Miss E. Pettigrew, of the CREDENDA CONDUITS CO., LTD., demonstrated electric cooking; the J. P. TUBULAR HEATING CO., LTD., gave a display of its well-known tubular heater, a festooned specimen of flexible type claiming that "it ties 'knots' in other forms of heating." The GENERAL ELECTRIC CO., SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., the EDISON SWAN ELECTRIC CO., LTD., METRO-VICK SUPPLIES, L. G. HAWKINS AND CO., LTD., and SANTON, LTD., were among others represented; a selection of E.D.A. posters, effectively framed in panels, was another exhibit.

A number of electrical exhibits were shown in the scientific section of the annual Conversazione of the Birmingham and Midland Institute which was held from January 7th to 10th. The GENERAL ELECTRIC CO., LTD., Witton, had on view two models representing two different types of sub-station layouts as supplied to the Central Electricity Board in connection with the Central England Scheme. One model, of the H.D.B. type, represented a high steel structure carrying bus-bars in duplicate, with oil circuit breakers on the ground. The other type, "L.N.E.," showed a lower form of construction, having isolators on concrete stools and oil circuit breakers on the ground, this latter type being used for the small or less important stations. High power electric aerodrome lights and illuminated wind indicators were exhibited by CHANCE BROS. AND CO., LTD., Smethwick. Mr. W. WILSON, of the General Electric Co., had three simple exhibits illustrating in a graphical manner the production of mechanical power in three types of electric motor. Professor J. B. KRAMER, also of the General Electric Co., gave demonstrations with television apparatus.

A number of "Wembley" lanterns have recently been installed by the Bloemfontein Municipality for street lighting, and the untouched photograph reproduced on p. 76 shows a night view of President Brand Street, which is illuminated by means of these units equipped with 500 W white bowl-sprayed Osram gasfilled lamps mounted at a height of 22 ft. with 120 ft. spacing. The civic authorities of Bloemfontein are extremely proud of the installation, and photographs of the lighting have been featured in the Orange River Colony newspapers alongside a photograph of the Thames Embankment lighting in London, to show that a really up-to-date system of street lighting has been adopted. In all some 110 lanterns, complete with brackets for pole mounting, have been supplied by the BRITISH GENERAL ELECTRIC CO., LTD., of Johannesburg. The Bowling Greens and the "Wanderers'" sports ground at Bloemfontein have also had a lighting system installed, Geco reflectors, equipped with 1 000 W lamps, being employed for this purpose. A number of tennis courts are also lighted, the installation including specially designed elliptical reflectors.

Elaborate preparations are in hand to ensure that the speeches at the opening ceremony of the Five Power Naval Conference, which takes place in the Royal Gallery of the House of Lords on January 21st, shall be perfectly audible to all present. No fewer than seventeen microphones will be installed, pride of place being taken by the special gold and silver cased instrument reserved by the MARCONIPHONE CO., LTD., for the exclusive use of the King. This is to rest on a pedestal before the Throne, and has been entirely refurbished for the event. Round the table at which the twenty-eight delegates are seated will be fourteen Marconi-Reisz microphones, of the type used for broadcasting, and two more are allotted to the interpreters. As each speaker rises a "look-out" man posted in an alcove will signal by telephone to the engineers in charge of the apparatus in the ante-room, and the correct microphone will be switched into circuit. Thus every word will be picked up by the apparatus with a minimum of background, and the danger of "howl back," due to the proximity of the loud speakers, is practically eliminated. An eleven-valve power amplifier will deliver its output to seven loud speakers of a special type suspended vertically from the roof. These employ rubber diaphragms driven by a moving coil, and are disposed to give an adequate distribution of speech over the entire seating area.



A SECTION of the new offices of the Commercial Union Assurance Co., Ltd., 22, Cornhill, where Siemens "Silvaray" fittings and gasfilled lamps are employed. Over 300 such fittings have been installed in the offices on the upper floors, the whole of the electrical installation work being carried out by Electrical Installations, Ltd., under the supervision and to the plans and specifications of Albion T. Snell and Partners, the consulting engineers for all internal engineering services.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BLACKPOOL CORPORATION.—Supply of six 6 600 V, 50 cycle, three-phase, sub-station switchboards. Particulars and specification from Mr. Charles Furness, borough electrical engineer, Electricity Offices, Shannon Street, Blackpool .

LLANDUDNO HOTEL.—Re-wiring of bell system of a large hotel at Llandudno. Specification, etc., from Messrs. J. H Jones and Fogg, Tatlow and Co., 69, Mostyn Street, Llandudno; deposit £1.

Lighting Installations.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 17th.—One year's supply of cables, electricity meters, cable terminal and other boxes, switches, wires, lamps and sundries. Specification, etc., from the Town Clerk, Municipal Buildings, Upper Street, London, N.1.

BRADFORD CORPORATION, January 18th.—Electrical installation at Thornton district baths. Specification, etc., from the City Architect.

CHELTENHAM CORPORATION, January 18th.—Supply of electric light fittings, etc., for one year. Tender forms from Mr. J. S. Pickering, borough engineer. Municipal Offices, Cheltenham.

ISLE OF MAN GOVERNMENT PROPERTY TRUSTEES, January 18th.—Electrical installation in Gronk Ruagh Hospital, Ramsey. Specifications from the Government Office, Douglas; deposit £1 1s.

MANCHESTER WATERWORKS COMMITTEE, January 18th.—Supply and erection at Haweswater, Westmorland, of three 275 H.P. oil engines, direct coupled to three 200 kW d.c. generators, etc. Specifications, etc., from the Engineer, Waterworks Offices, Town Hall, Manchester; deposit £2 2s.

WEST RIDING COUNTY COUNCIL, January 18th.—Electric light installation in the mixed department of Riveton Park Council School. Specifications from Mr. A. Rayner, 151, Cross Hill, Ecclesfield.

CENTRAL ELECTRICITY BOARD, January 20th.—Supply and erection of 3·3 kV, 6·6 kV, and 11 kV switchgear, for connecting the Board's supply to undertakers' busbars. Specification (N.W.E.—G.S.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

BELFAST GUARDIANS, January 21st.—Electric lighting installation in connection with alterations and additions to nurses' home at Belfast Infirmary. Specification can be seen and form of tender obtained on application to Mr. R. H. Wilson, clerk to the Guardians.

METROPOLITAN WATER BOARD, January 21st.—Supply and erection of four steam turbines, with pumps, and two electric generators, for Surbiton pumping station. Specification, etc., from the Chief Engineer (Room 173), 173, Rosebery Avenue, London, E.C.1; deposit £3 3s.

WORKSOP RURAL DISTRICT COUNCIL. January 21st.—Electric wiring of 26 houses now being erected at North Carlton, near Worksop. Forms of tender and specifications from the Surveyor, Council Offices, Highfield House, Carlton Road, Worksop.

BATH CORPORATION, January 22nd.—Supply of 60 000 lb. boiler, 7 000 kW turbo-alternator and e.h.t., h.t. and l.t. cables required during 12 months. Specifications, etc., from Mr. J. W. Spark, city electrical engineer, 7, Dorchester Street, Bath; deposit £2 2s.

HULL CORPORATION, January 22nd.—Supply and fixing of two 9 in, centrifugal pumps, with a.c. motors, switchgear, piping, etc. Forms of tender and other particulars from Mr. T. Thomas, city engineer, Guildhall, Hull; deposit £1.

HULL CORPORATION, January 22nd.—Electric wiring and fitting of first portion of Eastfield Road School. Specification, etc., from the City Architect.

GRIMSBY CORPORATION, January 23rd.—Manufacture, supply and erection of 10 000 kW three-phase turbo-alternator, with condensing plant. Specification, etc., from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby; deposit £2 2s.

LIVERPOOL CORPORATION, January 23rd.—Twelve months' supply of C.L.I. wrought-iron standards, brackets, etc., and No. C.L. 2 c.i. lamp columns, and malleable c.i. pitching irons, etc. Tender forms from the City Lighting Engineer, 17, Highfield Street, Liverpool. State name and number of schedule for which form is desired.

LIVERPOOL CORPORATION, January 23rd.—Twelve months' supply of materials to the electric supply department, including cables, compounds and tapes (Form E.S.1), insulated cables (E.S.2), meters (E.S.3), incandescent lamps (E.S.5), a.c. motors and starting gear (E.S.7), electric cookers and kettles (E.S.11), etc. Tender forms from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

LIVERPOOL CORPORATION, January 24th.—Supply of 10 300 copper bands, 35 in. by 65 in. long. Forms of tender from the City Engineer, Municipal Buildings, Dale Street, Liverpool.

MANCHESTER CORPORATION, January 24th.—Supply of sheet steel neutral earthing cubicles, etc., for power transformers, Cumberland Street sub-station. Specification (No. 261) and form of tender from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

ECCLES CORPORATION, January 25th.—Supply of 250 kVA three-phase, oil-cooled transformer, 6 600/400 V, 50 cycles. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Cawdor Street, Patricroft, Lancs; deposit £1 1s.

NORWICH CORPORATION, January 28th.—Supply and erection of refrigerating plant at the Isolation Hospital. Specification, etc., from Mr. J. S. Bullough, city engineer, Guildhall, Norwich.

CLUTTON RURAL DISTRICT COUNCIL, January 29th.—Electric light installations in 55 houses. Specifications, etc., from the engineer, Mr. J. Wayne-Morgan, 6, Church Road, Whitchurch, Cardiff.

COWDENBEATH CORPORATION, January 29th.—Electrical work in connection with erection of 32 houses at Randolph Street, Cowdenbeath. Specifications, etc., from Mr. C. A. Alexander, burgh surveyor, Town House, Cowdenbeath; deposit £2 2s.

WORSLEY URBAN DISTRICT COUNCIL, January 29th.—Twelve months' supply of electric lamps, etc. Forms of tender from the surveyor, Mr. J. Howard, Town Hall, Walkden.

ARMAGH COUNTY EDUCATION COMMITTEE, February 1st.—Electric lighting installation at Armagh New Public Elementary School. Plan and specification can be seen at the office of Mr. J. St. J. Phillips, 16, Donegall Square South, Belfast, or at the Education Offices, Armagh. Tender forms will be supplied.

CENTRAL ELECTRICITY BOARD, February 1st.—Supply and erection of 33 000 V overhead transmission lines in South-East England. Specification (No. S.E.E.—S.L. 3) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross London, W.C.2; deposit £2 2s.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, February 11th.—Twelve months' supply of cables for street mains and services (tender form E.S.1); lamps (E.S.2), meters (E.S.3), creosoted cable protection boards (E.S.4); plywood meter boards and insulators (E.S.5); ironclad service cutouts (E.S.6); street lighting standards and electric fittings (E.S.7); and creosoted wood service tee boxes (E.S.8). Forms of tender from the Electrical Engineer, 37, High Street, Cheadle, Cheshire.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

WAITEMATA (N.Z.) ELECTRIC POWER BOARD, January 18th.—Supply of three-phase 11 000 V 50 cycle transformers. (Reference B.X. 6 027.)

INDIA STORE DEPARTMENT, January 21st.—Supply of 43 205 battery cells, etc. Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

POSTMASTER GENERAL'S DEPARTMENT, MELBOURNE, January 21st.—Supply of dry cells (schedule C. 550). (Reference B.X. 6041.)

Digitized by Google

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 21st.—Four electric motor driven ventilating fans. (Reference A.K. 8 857.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 21st.—Spare parts for automatic telephones. (Reference B.X. 5 917.)

LATVIAN POSTS AND TELEGRAPHS, January 22nd.—Supply of telephone cable. (Reference B.X. 6 054.)

SOUTH INDIAN RAILWAY CO., January 24th.—Supply of cables and accessories, in connection with Madras improvements. Specifications and forms of tender (£1, not returnable) from the Company's offices, 91, Petty France, Westminster, S.W.1.

PRESIDENT Brand Street, Bloemfontein, illuminated by Wembley lanterns and Osram lamps. *(See note on page 74.)*

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 4th.—Friction disc saw, with electric motor, for cutting steel joists and rails (tender No. P.W. 3/46). (Reference A.X. 8 998.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 13th.—Supply of electric tube butt welding set. (Reference B.X. 6 005.)

LOUIS TRICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of distribution system (poles, conductors, transformers, meters, sub-station equipment, etc.). (Reference B.X. 6 003.)

CHILEAN STATE RAILWAYS, February 19th.—Supply of apparatus and material for a signalling service between Maipu and Cartagena stations and between San Fernando and Talca stations. (Reference A.X. 9 008.)

JOHANNESBURG MUNICIPALITY, February 20th.—Supply of switchgear (contract 322). (Reference B.X. 6 044.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of switchboard plugs (schedule C. 548). (Reference B.X. 5 998.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttleton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

POSTMASTER-GENERAL'S DEPARTMENT, March 24th.—Supply of dial parts (schedule C. 555). (Reference B.X. 6 047.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats Waitaki power scheme, section 8. (Reference B.X. 6 048.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

Tenders Accepted.

OLDHAM CORPORATION.—Union Cable Co., Ltd., supply of cable.

WAKEFIELD CORPORATION.—J. E. Fowler, electric wiring of 18 stalls at Pitching Market, £28 6s. 6d.

MAIDENHEAD T.C.—Edgar Fitton and Co., Manchester, heating apparatus, diphtheria ward, £371 9s.

EALING CORPORATION.—H. C. Poole and Son, electric wiring, Health Centre, Islip's Manor, Northolt, £100.

WEST HAM CORPORATION.—Murex, Ltd., supply of 63 tons of British standard tramway rails. (Recommended).

TENTERDEN CORPORATION.—C. Milsted and Son, electric light installation in houses at Shrubcote and Danemere.

H.M. OFFICE OF WORKS, ETC.—T. Clarke and Co., Ltd., electric light, rewiring of infirmary block of Chelsea Royal Hospital.

EASTBOURNE CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd., erection of overhead lines to Friston and East Dean, £2 537 9s. 8d. (Recommended.)

STEPNEY (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., exhaust fan, £30; Metropolitan-Vickers Electrical Co., Ltd., electric motor, £85. (Both recommended.)

GENERAL POST OFFICE.—Telephone exchange equipment: Richmond (Surrey), Automatic Telephone Manufacturing Co., Ltd. Telephonic repeater equipment, General Electric Co., Ltd.

BRADFORD CORPORATION.—Aiton and Co., Ltd., steam piping for turbine, Hopkinsons, Ltd., main steam valves for turbine, J. Carter, electric lighting at Bolling secondary school, £1 038 7s. (All recommended).

STOKE NEWINGTON (LONDON) BOROUGH COUNCIL.—Bromford Tube Co., lamp columns, £6 10s. 5d. each; Holophane, Ltd., lanterns, £2 6s. 6d. each; Acme Lighting and Engineering Co., time switches, £3 1s. 6d. each. (All recommended).

REIGATE CORPORATION.—Callender's Cable and Construction Co., Ltd., cable extensions in Carlton Road, Redhill; T. S. Marriage and Co., Ltd., wiring small houses under hire-purchase scheme, 13s. 5d. per point; with extra 8s. 6d. for a two-way switch on any point.

LONDON COUNTY COUNCIL.—Burdette and Co., Ltd., preliminary electrical work in connection with adaptation of St. Magnus for a new secondary school at Forest Hill, £141. Also tendered: A. Hawkins and Co., £155; Coleby and Co., £162; A. Dean and Co., Ltd., £174; Smethurst and Co. (London), Ltd., £195.

HACKNEY (LONDON) BOROUGH COUNCIL.—Plant in connection with the 30 000 kW extension at Millfields Road generating station: Simon-Carves, Ltd., boiler house, boiler house plant and accessories, including coaling gear, £222 039 (recommended); also tendered:—John Thompson Water Tube Boilers, Ltd., £223 495; Stirling Boiler Co., Ltd., £238 756; Mitchell Conveyor and Transport Co., Ltd., £250 795; Underfeed Stoker Co., Ltd., £254 501; Babcock and Wilcox, Ltd., £255 051. C. A. Parsons and Co., Ltd., 30 000 kW turbo-alternator, feed water heaters, and Hick-Hargreaves condensing plant and auxiliaries, £105 484 (recommended); also tendered:—A. E. G. Electric Co., Ltd., £84 516; Brush Electrical Engineering Co., Ltd., £102 750; Richardsons Westgarth and Co., Ltd., £105 600; English Electric Co., Ltd.; £106 001; British Thomson-Houston Co., Ltd., £106 350; Fraser and Chalmers Engineering Works, Ltd., £107 543; Metropolitan-Vickers Electrical Co., Ltd., £108 387; alternative tenders: C. A. Parsons and Co., Ltd., £99 993; English Electric Co., Ltd., £101 501; Herbert Morris, Ltd., overhead travelling crane, £3 040; also tendered:—Vaughan Crane Co., £3 115; Ransomes and Rapier, Ltd., £3 595; Babcock and Wilcox, Ltd., £3 928 5s.; Stothert and Pitt, Ltd., £4 170. A. Reyrolle and Co., Ltd., switchgear, £77 900; also tendered:—General Electric Co., Ltd., £77 224; English Electric Co., Ltd., £78 576 14s.; Ferguson Pailin, Ltd., £80 541; Park Royal Engineering Co., Ltd., £81 908 10s.; British Thomson-Houston Co., Ltd., £83 314; Metropolitan-Vickers Electrical Co., Ltd., £84 911.

WORK IN PROSPECT.

BATH.—Extensions to cost between £20 000 and £30 000, for Sir Isaac Pitman and Sons, Ltd. Particulars, Messrs. Hayward and Wooster.

BROMLEY (KENT).—Extensions, Maternity Hospital. Particulars, Mr. P. A. Coad, architect.

CROYDON.—Three new schools and extensions. Particulars, Mr. John M. Newnham.

DARTFORD.—Houses (14). Particulars, the Surveyor.

EASTBOURNE.—Houses (28). Particulars, the Borough Surveyor.

GARSTON.—School (412 places). Particulars, Mr. A. E. Prescott, County Architect, Hatfield.

LLANDRINDOD WELLS.—Extensions to intermediate school. Particulars, Mr. J. Mostyn, Director of Education.

MAIDENHEAD.—New block, Isolation Hospital. Particulars, the Borough Surveyor.

NEWCASTLE-ON-TYNE.—New warehouse. Particulars, Messrs. Cachett and Burns Dick, architects, Pilgrim House.

NOTTINGHAM.—Shops and offices. Particulars, Messrs. Calvert and Jesson, Low Pavement, Nottingham.

PERSHORE.—Senior school (400 places). Particulars, Mr. A. W. Priestley, Shire Hall, Worcester.

READING.—Housing scheme (237). Particulars, the Borough Surveyor.

RICCALL.—School. Particulars, the clerk, Mr. J. R. Procter, Beverley.

ROMFORD.—Intermediate school. Particulars, Mr. J. Stuart, Chelmsford.

ROTHWELL.—Conservative club. Particulars, Col. John Brown, Northampton.

RUGBY.—Block of offices. Particulars, Mr. W. T. Loveday.

RYE LANE.—Business premises. Particulars, Messrs. North Robin and Wilsdon, architects.

SCARBOROUGH.—New wing, stone pavilion, etc., Queen Margaret's School, to cost £42 000. Particulars, Mr. T. J. Rushton, 2, New Square, Lincoln's Inn, London, W.C.2.

RELIGHTING SAFETY LAMPS.

New Relighting Order Requiring Preliminary Examination of Lamps.

THE Secretary for Mines has made and published an Order in pursuance of Sections 33 and 35 of the Coal Mines Act, 1911, and of the Coal Mines General Regulations (Safety Lamps), 1927, authorising and prescribing conditions for the use of flame safety lamps fitted with self-contained relighting devices. The Order, which is entitled "The Safety Lamps (Relighting) Order of 1929," extends the operation of the Safety Lamps (Relighting) Order of 1927 from January 1st until further order, and is in the same terms as the existing Order, except that the opportunity has been taken to make clearer the intention of paragraph 3 in regard to the examination of the lamp to be made before relighting it underground. The intention of this requirement is to prohibit the relighting, without previous examination by the light of an electric safety lamp of approved type, of a lamp which has been extinguished by a fall or blow, and may have suffered damage in this or some other way. A foot-note has also been added explaining that "an electric safety lamp of approved type," for the purposes of paragraph 3, includes electric torches approved for the use of officials or for special purposes.

RESTRICTION OF RUBBER SUPPLIES.

IT is reported that the Dutch rubber producers, who are meeting at Amsterdam to consider methods of improving the position of the rubber industry, have decided to attempt to restrict production by 10% to 20%. A committee will visit Java to propose the restriction of tapping, and the deposit by European and native producers of 20 fl. per ton and 2 c. per kg. respectively, which will be forfeited if the proposed restriction obligations are not fulfilled. Rubber has fallen to about 7d. per lb.—the lowest figure in the last seven years—and this, with the rise in London stocks during the past year, is regarded as an indication that production is in excess of demand. In London and Liverpool the stocks amount to 78 630 tons, compared with 22 691 tons a year ago, and stocks throughout the world are estimated at 210 000 tons. On the other hand, consumption increased last year by about 130 000 tons, and the total consumption, including reclaimed rubber, was over 1 000 000 tons—a record figure. The Dutch producers desire to consult with British producers and other foreign interests on the situation.

RURAL ELECTRIFICATION.

Australian Opportunities for Manufacturers of Electro-Farming Equipment.

THE State Electricity Commission of Victoria announces that steps are being taken by the Commission to develop more aggressively the farm load, and as a result of initial activities numerous inquiries are being received in connection with electrically-operated farm equipment. It is apparent that the Commission must be in a position to furnish full information to its consumers on the prices, energy consumption and the source of supply of all types of farm electric devices, and particularly incubators and brooders; egg cleaning apparatus; milking plants; separators; dairy water heaters; water systems; milk coolers; refrigerators; pasteurisers; portable single phase, 460 V, fractional H.P. motors,, 230 V, integral reduction gear, variable speed single phase motors; lawn-mowers; greenhouse heating equipment. Also all classes of farm machinery, such as chaff-cutters, feed crushers, etc., in which electric motor drive is integral to the plant.

The Commission, therefore, invites such firms as manufacture any of the above equipment to communicate with 22, William Street, Melbourne, stating particularly (*a*) the name and address of their representative in Australia, if any; (*b*) if not represented, the terms on which they will ship sample equipment; (*c*) the price, weight, cubic measurement packed and whether wholly manufactured in Great Britain; (*d*) the output, wattage and energy consumption of appliances, together with as complete descriptive and illustrated matter as will enable the Commissioners or their clients to order, if necessary.

It may be mentioned that a large electrical exhibition will be held in Melbourne in September next, and the Commission would like to be in a position to introduce some of the latest farm electric appliances on that occasion.

TRADE PUBLICATIONS.

THE REVO ELECTRIC CO., LTD., Great Queen Street, London, W.C.2, has issued a new folder relative to loud speakers.

W. BEARDSALL AND CO., LTD., 5, Victoria Bridge, Manchester, have sent us copies of two new lists relative to lighting-fittings.

The current stock list of electrical accessories has been received from BAXTER AND CAUNTER, LTD., 219, Tottenham Court Road, London, W.1.

List 410 entitled "Conduit and Conduit Fittings" has been published by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38, Upper Thames Street, London, E.C.4.

The "Mignon" electric hand drill is the subject of a new folder by the ELECTRICAL EQUIPMENT AND CARBON CO., LTD., 100/111, New Oxford Street, London, E.C.1.

"Electro-Vapour Radiators" is the title given to a new coloured folder by the manufacturers, BENHAM AND SONS, LTD., 64/66, Wigmore Street, London, W.1.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., has published list Nos. 6638 and 6643, describing the type P 225 power amplifier and "Brookman's" rejector respectively.

We have received from FRY'S (LONDON), LTD., 24/26, Water Lane, London, E.C.4, a copy of the company's new catalogue dealing with tools. The new issue covers equipment for the engineering and carpentery trades and is profusely illustrated.

An interesting publication just issued by BRITISH INSULATED CABLES, LTD., Preston, Lancs., is a brochure entitled "The Central Scotland Electricity Scheme." This publication tells the story of the Scottish grid in words and pictures, the latter being large plates of outstanding excellence. The first illustration shows the marking out of the tower sites, and is followed by other pictures showing overhead line construction from this stage until a final landscape plate shows part of the country with the lines erected. In all there are twenty-five full-page illustrations with two pages of "cinema" snapshots showing steps in tower erection.

BENN BROTHERS' JUBILEE.

The Jubilee Dinner of Benn Brothers, Ltd., will take place at the Wharncliffe Rooms, Great Central Hotel, Marylebone, London, N.W., on Saturday, February 1st, at 6.15 p.m. The Rt. Hon. J. H. Thomas, M.P., Lord Privy Seal, will be a guest of honour at the dinner, and dancing will follow.

ELECTRICITY SUPPLY.

Proposed New Plant at Bath—Scunthorpe Assisted Wiring—Inauguration of Clitheroe Undertaking—Power Development on the St. Lawrence—Home System Charges at Preston—Glasgow's Change of Frequency.

WIMBLEDON Corporation is to apply for permission to extend the plant at the generating station.

Bath Electricity Committee recommends the City Council to apply for a loan of £24 960 for the installation of a 7 000 kW turbo-alternator.

An application has been made by Scunthorpe and Frodingham U.D.C. for a loan of £1 568 for the assisted wiring of an additional 200 houses. Under the scheme 340 houses have been wired, leaving 60 to complete the number sanctioned by the Commissioners.

Worcestershire County Highways Committee has received from the Shropshire, Worcestershire and Staffordshire Electric Power Co. an application for consent to erect overhead distribution lines along the Bewdley-Kidderminster Road, in order to supply street lighting in Wribbenhall. The Committee has consented to the erection of necessary short sections of overhead line.

Dagenham U.D.C. has accepted the offer of the County of London Electric Supply Co., Ltd., to lay mains and services and supply wiring and lighting fittings in connection with the new housing estate, at 18s. 8d. per point per house for a total of 107 houses. Tenants who desire to adopt the domestic two-part tariff system are to be supplied at the rate of 1s. per week, plus 1d. per kWh.

The Minister of Transport, on January 9th, informed a deputation from the Council for the Preservation of Rural England that the national grid was to go ahead. He did not see any difficulty in arranging a certain measure of consultation in the central body of the Council with regard to main transmission lines. Apart from the big structures of the grid, the rural transmission lines were not conspicuous.

The Chief Engineer of the Aldershot Command has informed Aldershot Corporation that it is proposed to extend the Command electricity station, and has asked whether the Council desires to increase its bulk demand above the present 1 200 kVA maximum. The Council has decided to ask that provision be made for a maximum of 1 500 kVA until the expiration of the present contract in September, 1931.

The inauguration of Clitheroe's electricity extension to the West Riding villages of Waddington, West Bradford and Grindleton will take place to-morrow (January 18th). The Mayor, members of the corporation and a number of visitors will be present at the opening ceremony, and there will be a cinema novelty at the picture house, demonstrating the many purposes to which electricity can be applied in country places.

Godalming T.C. is in negotiation with the Aldershot Gas, Water, and District Lighting Co. with reference to the transfer to the company of the local undertaking of the Urban Electric Supply Co. The Mayor announced recently that a sub-committee was negotiating with the Aldershot Co., and it was hoped that terms would be submitted enabling the Council to consent to the transfer. Guildford R.D.C. is not to oppose the transfer.

Modifications have been made in Fleetwood Council's electrical development scheme for the provision and laying of mains and supply of current to the south-westerly portion of the district. A modified scheme, involving an estimated expenditure of £15 000, has been adopted, subject to the Unemployment Grants Committee's sanction to the alterations and to 33⅓ per cent. of the requisite labour being obtainable from the distressed areas.

Derby T.C. has applied for a loan of £77 398 for electricity purposes and for the withdrawal of a previous application for a loan of £50 000 for mains, transformers and motors. Application has also been made to the Unemployment Grants Committee for grants towards the cost of laying pipes in streets where electricity mains are not at present provided, £3 100; and changing over supply in outlying districts where d.c. mains are in operation, £21 000.

Dungannon U.D.C. has received a letter from Electrical Supplies, Ltd., stating that the company considers the Council's resolution in favour of obtaining an option to purchase, should the firm be granted an Order by the Electricity Commissioners, unreasonable. A letter from the Dungannon Gas Co. states that if granted the Order it would be prepared to grant the Council an option to purchase. It has been decided not to support the Gas Co.'s application.

A concession has been granted for the supply of electricity within a radius of 14 miles of Jerusalem. The Power Securities Corporation, which has acquired the rights from the Greek pre-War concessionnaire, is to hold the concession for 44 years.

The conference between the Canadian Federal Government and the Ontario and Quebec Provincial Governments in regard to the water power of the St. Lawrence and other rivers, is to take place on January 20th. It is understood that the engineers of the Hydro-Electric Commission of Ontario and the technical experts of the Federal Government, who originally favoured different plans for power development on the St. Lawrence, have now arrived at a compromise in regard to the matter.

Mr. E. Kilburn Scott, who planned and supervised the installation of new electrical plant at the Royal Merchant Seamen's Orphanage, Bear Wood, near Wokingham, informs us that the plant has now been running for over a year, and the total cost of electricity generated works out at 0·084d. per kWh, or about 1d. including interest on capital and depreciation. The plant includes a 60 H.P. Fielding and Platt semi-Diesel engine driving a 30 kW dynamo, and a booster to charge the storage cells.

Wakefield Electricity Committee has decided to charge a flat rate of 2d. per kWh for shop window lighting and advertising displays, with a minimum of 21s. per 100 W lamp per annum.—The Committee is considering a draft scheme for assisted wiring of premises.—The percentage charges under the rateable value tariff for electricity are to be up to £20 rateable value, 17½%; above £20 and up to £60, 15%; above £60, 12½%.—Terms for the supply of electricity in bulk to British Ropes, Ltd., have been arranged.

It was alleged by Coun. H. E. Rhodes, chairman of the Electricity Committee, at a recent meeting of Preston Corporation, that certain people took undue advantage of the home system charges. In future, he said, it would be a condition that there should be a minimum consumption of 1 kWh per day per kilowatt installed. Some consumers were using less current than before they adopted the system. After hours lighting in shops would be reduced to 2½d. per kWh.—The Chairman said there had been complaints that unauthorised persons had been opening sealed electric slot-meters and robbing them.

A conference was held at Leicester recently between representatives of the Central Electricity Board, the County Council and other public bodies, with regard to the scheme for carrying electricity from Birmingham to places in the Midlands, including Leicester, Loughborough, Nottingham and Burton. The overhead cables would be carried by steel lattice-work towers. It is understood that objection was made by Leicester on the ground that it would interfere with the scheme for a municipal aerodrome at Braunstone. No agreement was reached at the conference, and it is probable that another will be held shortly.

The York City Electrical Engineer reports that it has become necessary to consider the advisability of commencing to change the centre portion of the town to alternating current, that he has prepared a scheme to effect this change-over, and that the cost is estimated at £36 395. The report has been adopted by the Electricity Committee.—The Committee has made an agreement with Osbaldwick Parish Council to supply and erect four brackets and nineteen posts for street lighting at a cost of £187, and to supply the necessary current and lamps and attendance during six months in each year, the lighting to be from dusk to dawn, at two guineas per lamp per annum.

Mr. Herbert Bell, manager of the Glasgow electricity department, reports with regard to the change of frequency in the north-west district of the city, that a complete survey has been made and that the approximate cost of the change over, based on the assumption that an extra supply at Port Dundas by the Central Electricity Board is available at the date previously arranged, will amount to £248 000, made up of generation, £35 000; inter-connection, £5 000; distribution, £131 000; adaptation of consumers' equipment £65 000, and management, £12 000. The Electricity Committee has instructed the manager to submit the scheme to the Central Electricity Board.

COMPANY NEWS.

Quiet Market in Electrical Securities—New Electrical Plant for Burma Mines—Calcutta Electric Supply Corporation and Foreign Shareholders—Reports, &c.

DURING the past week there has again been little activity in the electrical stock and share market, and changes in quotations, so far as the securities quoted in our list are concerned, have been slight, except in a few notable cases such as those of the County of London Electric Supply Co.'s ordinary shares, which have jumped from 42s. 6d. to 46s. 3d., Hydro-Electric Securities, which after a rise from 38½ last week have again improved from 40 to 43⅜, the Victoria Falls Electric Power Co.'s ordinary, which have risen from 57s. 6d. to 61s. 3d., and the Calcutta Electric Supply Corporation's ordinary shares, which have this week put on half-a-crown.

Calcutta Electric Supply preference have not yet regained the 1s. 3d. dropped a week ago, and they still stand at 20s. Rises have to be recorded this week in International Holdings from 5⅛ to 5⅝, Lancashire Electric Light and Power ordinary from 27s. to 27s. 6d., London Electric Supply ordinary from 26s. to 26s. 6d., Midland Counties Electric Supply ordinary from 27s. to 28s., South Metropolitan Electric Light and Power first preference from 25s. to 25s. 7½d. In the traction section advances have taken place in British Electric Traction preferred ordinary from 121½ to 122½ and 6% preference stock from 123½ to 125½, London Electric Railway 4% preference from 71½ to 72 and 4% debentures from 76½ to 77; Metropolitan Railway ordinary from 62½ to 64 and 3½% preference stock from 61 to 62; and Underground Electric Railways ordinary from 21s. to 22s.

Amongst the manufacturing companies the following increases have occurred:—British Insulated Cables ordinary, 1s. 3d.; W. T. Henley's ordinary, 1s. 3d.; and Telegraph Construction ordinary, 1½. Anglo-American Telegraph 6% preferred, Cables and Wireless "A" ordinary and Great Northern Telegraph shares each put on one point, while Marconi International Marine appreciated to the extent of 2s. 6d. British Electric Transformer 7% preference remain at 10s. as last week, having failed to regain the 3s. 1½d. dropped compared with the week before. Electric Construction first mortgage debentures are down by two points, to 69½, and Siemen's preferred by 1s. 3d. to 31s. 3d.

These paymts. will again bring distribution to £3 15s.% on Ord. and £6% on pfd. stk., the paymt. on dfd. same as last year.

CREED TELEGRAPHEN APPARATE G.M.B.H.—Messrs. Creed and Co., of Croydon, announce the formatn. of a company in Germany associated with the International Telephone and Telegraph System, to be known as Creed Telegraphen Apparate G.m.b.H. The new company has been formed to manufacture and exploit the sale of Creed printing telegraph apparatus in Germany.

AMERICAN COMMONWEALTH POWER CORPORATION.—The Corporation and subsidiaries rpt. gross earngs. of $24 721 431 for year to Nov. 30, increase $6 942 917. Net earngs. $10 879 146, agst. $6 919 291. Blce. for divs. and reserves of parent corporation $4 285 141, increase $2 503 786. Blce. for reserves, Federal taxes and surplus, after divs. on 1st and 2nd. pref. stks. of parent had been paid, $3 666 459 agst. $1 150 383.

SIMMS MOTOR UNITS, LTD.—The directors have sent a letter to shhldrs. statg. that the business during the past year has been quite satisfactory, and continues so, steady progress being made. In view of the recent quotatns. of the company's shs. on the London Stock Exchange, the directors feel that this informatn. will prove useful to shhldrs. The directors' rpt. and accts. for the financial period ended Dec. 31 will be issued at usual time—about the end of April.

BERLIN CITY ELECTRIC CO.—Redemption of part of the $15 000 000 (£3 000 000) issue of 30-year 6½% sinkg. fund debs. made last Feb. by Dillon Read and Co., on behalf of the Berlin City Electric Co. ("Bewag"), is announced by the bankers. The designated debentures, totalling $87 000 (£17 400) principal amt. of the issue, will be payable at 100% with int. on Feb. 1, 1930, at the office of Dillon Read and Co., in New York, at the offices of Guinness, Mahon and Co., in London, or at certn. offices in Amsterdam, Zurich, Basle, and Stockholm.

COMMONWEALTH AND SOUTHERN CORPORATION.—The Commonwealth and Southern Corporation is about to reorganise and acquire the businesses of the Allied Power and Light Corporation, the Commonwealth Power Corporation, the Pennsylvania-Ohio Electric Co., and the South Eastern Power and Light Co. The Allied Power and Light Corporation, which was formed last May, consolidated the Hodenpyl Hardy and Co., Stevens and Wood and other interests; and the Commonwealth Power Corporation controls the Consumers Power Co., Central Illinois Light, Illinois Power, Southern Indiana Gas and Electric, Ohio Edison, Illinois Electric Power, Tennessee Electric, etc. The South Eastern Power and Light, which was incorporated in Maine, in September, 1924, sold its various artificial gas properties to Central Public Service Corporation last March.

Company Meetings.

BURMA CORPORATION, LTD.—Mr. P. E. Marmion, presiding at a meeting in Rangoon on December 20th, said during the period under review they had taken the necessary steps to ensure that their undertaking shall always remain under British control. This had to be done to comply with the terms of their lease. No impediment had been put in the way of anyone, of whatever nationality, who wished to buy or to hold shares in the corporation. In addition to the extensions and alterations to their milling plant they had effected various improvements to their smelter and refinery and added to their hydro-electric station at Mansam Falls. The units generated in 1924 were 25 millions, against nearly 44 millions for the year under review, an increase of 76%. Arrangements had been made to replace some of the existing units with new plant in order to make available at Namtu still more electrical energy. Their efforts at making the best possible use of the volume of water at their disposal had met with singular success. It was truly a case of stretching the water to its maximum limit.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—A general meeting of members of the Corporation was held on January 10th to consider a resolution to alter the articles of association. The chairman, Lord Meston, said the resolution could be divided into two parts, the first dealing with alterations necessary to bring the articles of association into line with the provisions of the new Companies Act, and the second dealing with alterations to secure the maintenance of British control of the company. The first set of alterations was carried without discussion. The chairman, proposing the adoption of the alterations regarding the maintenance of British control, said their effect was, briefly, that the holding of shares in the company by persons who were not British subjects should be limited to 20% of the total number of issued shares, and that the directors of the company should be British subjects. A misapprehension appeared to exist to the effect that the proposals indicated hostility to the investment of American capital in India. So far as that company was concerned there was no such hostility, and never had been any. Another bogy was the idea that the proposal was aimed against Indian shareholders. That suggestion was misleading. British Indian shareholders were subjects of the Crown, and as such were not foreigners; they were in no way affected by the restriction. Nothing would be done to prejudice foreigners who were already holders of their shares. Their holdings would be put on their foreign register, but nothing else would happen. In the case of an ordinary commercial concern the control to be exercised by virtue of holding a majority of the shares was purely a matter of supply and demand. With a public utility company the position was different. Besides the present owners and any propsective future owners, there was a third interested party, namely—the public authority which brought the utility company into existence by granting it a concession. Last year the company had received an intimation from the Bengal Government that they regarded it as essential that control of the company should remain in British or Indian hands and that should transfer of that control be contemplated the Local Government would have to consider in consultation with the local authorities affected by the licences and with the Government of India, the question either of compulsory purchase at the time stipulated in the licences, or of imposing a condition in the licences requiring financial control to be held by British or Indian interests. Since then they had applied for a licence for a small subsidiary area and the Government had made it plain that they were going to await the company's action before any new licence was granted. Mr. T. J. Carlyle Gifford said that he represented over 80 000 ordinary shares held by investment trust companies and their view was that the example which the directors, and through them, the Government of Bengal, was setting was most injurious to the financial interest of London and Great Britain. On being put to the meeting, the proposals were supported by 33 votes against 14, and, as this did not give a three-fourths majority, a poll was demanded. On several shareholders withdrawing their opposition, the Chairman said although the official opposition was withdrawn, a poll had been demanded, and under the law this must proceed. The result is to be declared to-day (January 17th).

Order Made on Application for Discharge.

LANGLOIS, Herbert Augustus, electrical engineer, trading in co-partnership with Daniel Timothy Donovan, under style of THE LONDON ELECTRICAL COMPANY, at 119, St. Mary Street, formerly 124, Queen Street, Cardiff. Discharged December 3rd, consenting to Judgment for £150 and £1 10s. costs of Judgment, payable £50 forthwith and £100 on or before June 3rd, 1931, to the Official Receiver.

Partnerships Dissolved.

BLACKBURNE AND PARKER (Roger Giles Marrick BLACKBURNE and Walter Mansel PARKER), radio engineers, 20, Southsea Road, Kingston-on-Thames, and 46B, Victoria Road, Surbiton, by mutual consent as from December 1st, 1929. Debts received and paid by R. G. M. Blackburne, who continues the business.

BRISTOW AND CO. (Leonard BRISTOW and Edwin BRISTOW), electrical engineers and lampshade manufacturers, 40, Sloane Street, 5, Maddox Street, 63, Buckingham Gate, 9, Pollen Street, 21, Astwood Mews, by mutual consent as from September 30th, 1929.

MOUNTAIN, WOOD AND MACLEAN (Kenneth Arthur MOUNTAIN, William Wellesley WOOD and Archibald Barr MCLEAN), electrical and mechanical engineers, Sun Buildings, Newcastle-upon-Tyne, and at Birmingham., by mutual consent as from December 31st, 1929, A. B. MacLean, retiring from the business. Debts received and paid by K. A. Mountain and W. W. Wood, who will continue the practice under the former style of W. C. Mountain, Son and Wood.

Bankruptcy Proceedings.

BATES, VICTOR HAROLD, trading as THE LINTON RADIO SERVICE, High Street, Linton, Cambridgeshire, wireless engineer. The adjourned public examination herein was held recently at the Guildhall, Cambridge. According to the statement of affairs there were liabilities amounting to £204, against assets of £56, thus leaving a deficiency of £148. Debtor stated that he was formerly employed by his father in his boot business. In September, 1924, the debtor commenced business on his own account as a wireless engineer and boot repairer at Harlow with a capital of £55 in cash. The business was mainly wireless, but the greater amount of the profit came from boot repairing. In March, 1928, the debtor's mother died, and his father induced him to sell his business at Harlow and open a business in conjunction with him at Linton. Debtor stated that he agreed to do this on the understanding that his father would hand the Linton business over to him, but this he had failed to do. Debtor sold the business at Harlow for £140, and all the liabilities had been discharged except one. The debtor's father opened the shop at Linton and the debtor erected a workshop at the back at a cost of about £30. The debtor stated that his father's boot business and his own wireless trade were entirely separate. He attributed his failure to changing from Harlow to Linton, expenditure on buildings and plant at Linton, and insufficient profit. Debtor first became aware of his position about six months ago, since when he contracted a few debts, thinking that he would be able to realise sufficient on the sale of the premises and the business. The examination was adjourned for closing.

FELLOWS MANUFACTURING CO., LTD.—The statutory first meeting of the creditors and shareholders of the above were held recently at Bankruptcy Buildings, Carey Street, W.C.

The Official Receiver stated that the company was registered as a public company on July 25th, 1927, with a nominal capital of £175 000, to acquire Fellows Magneto Company under a scheme of reconstruction and to carry on business as manufacturers of wireless apparatus, motor electricians and ignition specialists.

According to the balance-sheet for the first seventeen months of the company's existence, the trading resulted in a gross profit of £109 343, nearly one-half of which was expended on advertising, and a net profit of £15 700. The result of the subsequent trading had not yet been ascertained, but it was clear that heavy losses had been sustained.

A draft statement of affairs had been lodged showing total liabilities £107 290, of which £46 336 was unsecured, and assets £61 612, which would be absorbed in the debenture and preferential claims. The deficiency with regard to contributories was estimated at £173 926. Those figures must only be taken as approximately representing the position, as proofs of debt amounting to £53 830 had already been received, as against the £46 336 returned as the amount of the company's unsecured indebtedness, but it was perfectly clear that no dividend could possibly be paid to the unsecured creditors unless the second debentures were to be set aside, in which event there might be a small dividend. Nor could any return be made to the shareholders.

The liquidation was left in the hands of the Official Receiver.

THE LEAD MARKET.

The market this week has been quiet and according to James Forster and Co. prices have fluctuated within narrow limits. Lead producers raised their price early in the week by 2s. 6d. per ton, but failed to stimulate demand, which remains dull.

Closing prices on January 10th were £21 8s. 9d. for January, £21 10s. for February, and £21 11s. 3d. for March and April, showing practically no change on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

COMING EVENTS.

Friday, January 17th.

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Domestic Hot Water." Speaker, Mr. C. H. Smith. 7.30 *p.m.*

Saturday, January 18th.

Association of Mining Electrical Engineers (South Wales Branch).—Cox's Café, Cardiff. Annual dinner.

Monday, January 20th.

Institution of Electrical Engineers (Mersey and North Wales–Liverpool Centre).—University, Liverpool. Discussion on "Low-Temperature Carbonisation of Fuel, with special reference to its combination with the production of Electricity." Introductory papers by Messrs. E. H. Smythe and E. G. Weeks. (Joint meeting with Liverpool Engineering Society.) 7 *p.m.*

Electrical Association for Women (Bristol and District Branch).—Rotary House, Colston Street. Lecture by Mr. S. Anderson on "Electric Light and Eyesight Preservation." 8 *p.m.*

Institution of Electrical Engineers (South Midland Centre).—University, Edmund Street, Birmingham. Paper by Messrs. T. W. Ross and H. G. Bell on "Recent Developments in the Protection of Three-Phase Transmission Lines and Feeders." 7 *p.m.*

Tuesday, January 21st.

Institution of Electrical Engineers (East Midland Sub-Centre).—College, Loughborough. Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch." 6.45 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Paper by Messrs. B. A. G. Churcher and A. J. King on "The Analysis and Measurement of the Noise Emitted by Machinery." 7 *p.m.*

Illuminating Engineering Society.—Royal College of Music, Prince Consort Road, South Kensington. Paper by Mr. C. H. Ridge on "The Art of Stage Lighting." 7 *p.m.*

Paisley Association of Electrical Engineers.—39, High Street. Lecture by Mr. A. Gerrard, on "Some Notes on Modern Tramway Equipment." 7.30 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Lecture by Mr. L. S. Atkinson on "Recent Developments in Modern Electric Lifts." 7.15 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Albert Hall, Cookridge Street, Leeds. Faraday Lecture by Captain P. P. Eckersley on "Broadcasting by Electric Waves." 7.30 *p.m.*

Institution of Electrical Engineers (South Midland Students' Section).—Birmingham University, Edmund Street. Paper by Mr. K. R. Sturley on "A.C. Potentiometers." 7.30 *p.m.*

Wednesday, January 22nd.

Electrical Development Association (North-Western Area).—4, Fountain Street, Manchester. Conference on "Sales Possibilities of Electricity in Advertising." By Mr. H. Lingard. 6.30 *p.m.*

Electrical Contractors' Association.—Savoy Hotel, Strand, London. Annual dinner. 6.30 for 7 *p.m.*

Institute of Wireless Technology.—Engineers' Club, Coventry Street, London. Paper by Mr. A. M. Houston Fergus on "Notes on the Fading of Wireless Signals." 7 *p.m.*

Institution of Automobile Engineers.—Engineers' Club, Albert Square, Manchester. Paper by Mr. H. K. Whitehouse on "Petrol-Electric Vehicle Characteristics." 7 *p.m.*

Thursday, January 23rd.

Electrical Association for Women.—46, Kensington Court, London. New Year Social. 3 *p.m.*

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch." 6 *p.m.*

Friday, January 24th.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Paper by Miss W. A. Leyshon on "Characteristic of Discharge Tubes under 'Flashing' Conditions, as Determined by the use of a Cathode Ray Oscillograph." 5 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre Students' Section).—Armstrong College, Newcastle-upon-Tyne. The Student Lecture.—"Electric Traction," by Lt.-Col. H. E. O'Brien. 7.15 *p.m.*

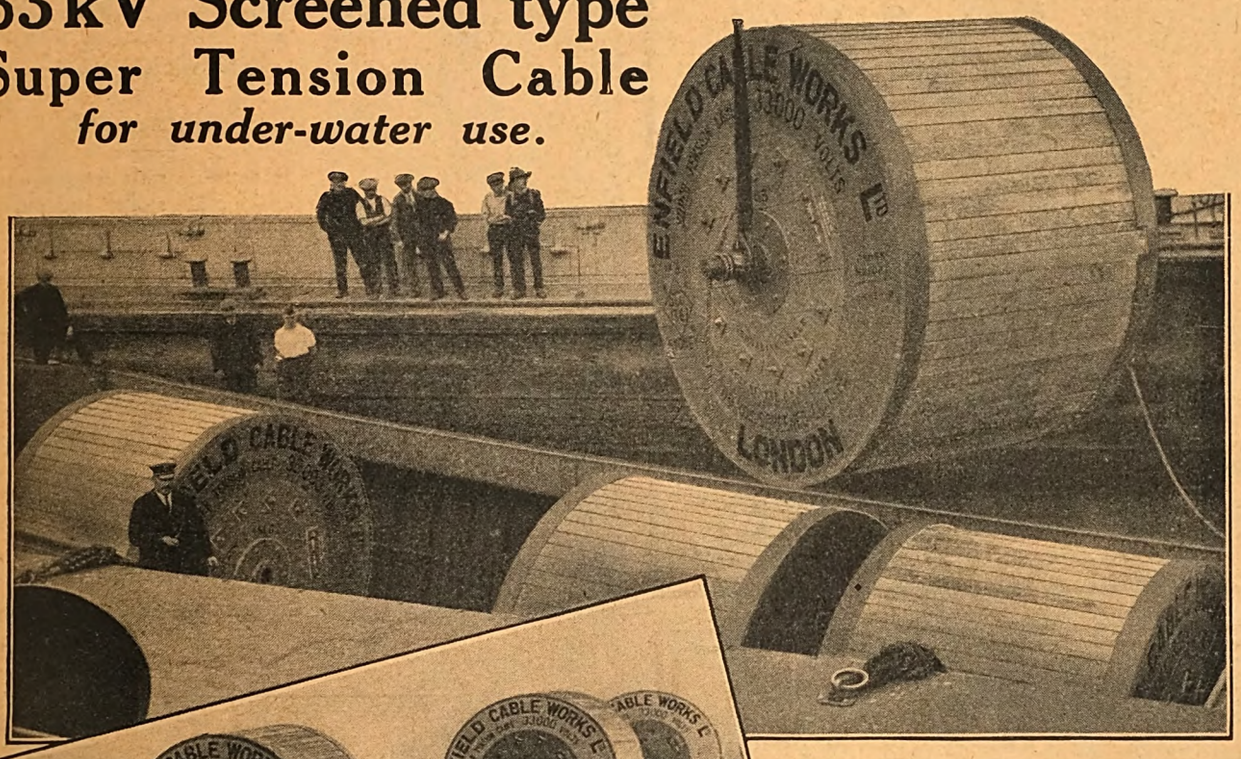
THE ELECTRICIAN

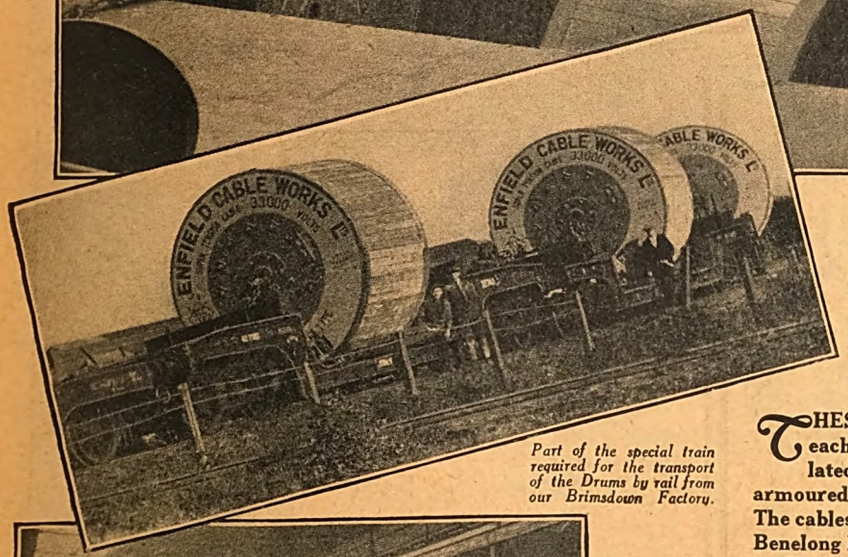
Vol. CIV.—No. 2695. Friday, January 24, 1930. [Registered at the General Post Office.] Sixpence

ANOTHER "ENFIELD" ACHIEVEMENT

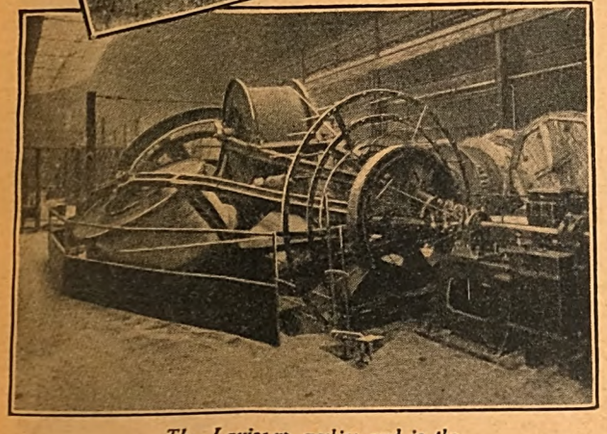
33kV Screened type
Super Tension Cable
for under-water use.



Drums being taken by barge for shipment per S.S. "Ferndale," King George V. Dock.



Part of the special train required for the transport of the Drums by rail from our Brimsdown Factory.



The Laying-up machine used in the manufacture of the cable. This machine is the largest of its kind in the United Kingdom.

THESE photographs concern a shipment of 5 Drums, each containing 700 yds. of 3 × ·25 sq. in. Paper Insulated, separately lead sheathed cables, double wire armoured and served, 33,000 Volts Super Tension Type.
The cables will be laid in parallel across Sydney Harbour from Benelong Point to Kirribilli, and are to be used as a connecting link to supply electric current by the Sydney City Council, from the Bunnerong Power Station to the North Shore.
Each Drum weighs 28 Tons 1 cwt. Gross—25 Tons Nett.
Size of Drums 11 ft. 1 in. diameter.
These are the heaviest Drums of cable made in Great Britain

Current Topics.

Coal Mines Bill.

THE Federation of British Industries, the British Engineers' Association and the London Chamber of Commerce are among the important bodies which have made strong representations condemning the provisions of the Coal Mines Bill which, together with the threat of higher taxation, is the darkest cloud on the industrial horizon at the present time. The gas industry is also bestirring itself, but the electrical industry is once again feeling the lack of a single federal organisation which could present its views on such an important matter. Supply undertakings and manufacturers will both feel the effect of dearer fuel and higher taxation, and it is time that their views on these matters were authoritatively voiced.

Rural Electrification.

MORE than 500 000 farms in the United States are now electrified, half of the number having been connected during the past three years. On the industrial side 75 per cent. of the power used in the United States is now electrical, compared with 66 per cent. in Germany and 48 per cent. in England. The figures have a bearing on the question that is now being asked in America: "Shall we increase our sales of current or our rates?" Most of the urban population of the United States is now supplied, and it is becoming necessary to build transmission and distribution lines into more remote and less thickly populated areas. Mr. M. S. SLOAN, president of the National Electric Light Association, takes the view that sales must be increased and that the way to stimulate domestic consumption is to reduce rates. This contention is supported by the figures of domestic consumption, which show that an increase in the annual use per consumer in the United States of 41 kWh, or 9 per cent., resulted in an increase of 90 cents, or 3 per cent., in the bill and a decrease of ·35 cent or 5½ per cent. in the charge per kWh. It is in a similar direction, as regards charges for current, coupled with a courageous policy on the part of urban undertakings in pushing out their distribution lines into rural areas and willingness to face an initial period of low returns, that the problem of rural electrification in this country will have to be tackled if the grid system is to do all that is hoped from it.

Meter Rents.

IT is a welcome announcement that the Hull Corporation expect to abolish meter rents at the close of the financial year. With small concerns—and even with large supply systems when in their infancy—meter rents are doubtless necessary, but there can be no good reason for retaining these quarterly annoyances when the annual energy supplied approaches 100 000 000 units—the consumption anticipated by Hull. Although the economist, regarding the question purely with an accountant's eyes, may see arguments in favour of the fixed and certain charges incorporated in meter rents, he fails to consider their psychological effect on consumers, who naturally prefer to feel they are receiving the precise equivalent—in energy—of every penny paid to the supply authority. Supply companies, however, frequently ignore the supreme importance of persuading their customers to use more energy. A small company in London has recently been changing the voltage of part of its system from 200 to 230. In one street the higher voltage was applied some days before the company changed the consumers' lamps—so that the latter were rendered almost worthless. Yet when a customer offered to buy back one of his 100 W lamps for experimental use in a room which had formerly contained a 60 W lamp the company would only sell it to him for the absurd figure of 2s.

Bad Salesmanship.

FAULTfinding with our methods of selling is apparently not confined to Australia, for Mr. HENNESSY COOK, speaking at the annual banquet of the British Chamber of Commerce recently, stated that every day made it

Digitized by Google

clear that British firms were "handicapping themselves very severely by not printing catalogues in French"; furthermore, though a great deal of money was spent in advertising, the drawing power was practically nil, by virtue of the fact that such advertisements were not adapted to the French mentality. These views are not, of course, confined to the electrical industry, but they do apply to selling methods of many electrical manufacturers. The good feeling which was created between the British and French electrical industries as a result of the last Summer meeting of the I.E.E. and the excellent work which was done by that ambassador of our industry, Col. K. EDGCUMBE, should not be forgotten, and the habit of the then I.E.E. President of addressing his hosts in the language of their country should surely have been taken by manufacturers as a useful hint upon which to base their future dealings with our French neighbours.

An Omission.

WE have heard some comment on the lack of State recognition of the late Dr. de. FERRANTI'S great services to the electrical industry and to the general public. It is to be feared that merit of a non-political character is too often overlooked when honours are awarded. Dr. FERRANTI was too much engrossed in his profession to thrust himself into the limelight as deserving of public reward, and friends, who might have urged his claims, were doubtless caught napping by his unexpectedly early death. In another page we print Colonel CROMPTON'S tribute to his old friend.

Underground Carriage of Goods.

A MODIFIED scheme for a Manchester Underground Railway is to be brought before the City Council by Mr. WALKER, chairman of the Underground Railway Committee, next month. This scheme, which comprises a circular ring with one extending arm, is estimated to cost £5 000 000, compared with an estimate of £11 000 000 for a circular track with five radial arms which were included in an earlier proposal. An impression prevails locally that the railway could only be operated at a considerable loss, which would fall upon the ratepayers, and that it is questionable whether it will, to any appreciable extent, relieve the congestion of traffic in the streets. A matter which might be worth further consideration is Mr. WALKER'S suggestion that between the rush hours the railway would be available for the transport of goods. A cheaper and perhaps more effective proposition might be an underground electric railway for goods transport only, which would leave more room above ground for passenger vehicles. It seems to be generally agreed that the solution of the street traffic problem will be found in the speeding up of motor traffic and providing it with as clear a course as possible, so as to enable it to get away quickly from busy junctions and crossings. This object might be attained by inducing manufacturers and traders to use the underground railway and by restricting horse traffic and loading and unloading of goods in the principal thoroughfares to certain hours when the motor traffic slackens.

Colour for Domestic Fittings.

IN our monthly article on domestic appliances, published in our last issue, we gave details of two devices for which a choice of colours is offered. One is a drink mixer—for use in cocktail bars and soda fountains—which can be had in white, black, green or ivory. The other, an electric iron, is available in blue, green or red. Evidently the steadily strengthening movement for more decorative lighting fittings is spreading to other sections of the domestic side of the industry. This is a very good thing for all concerned, as undoubtedly numerous buyers—especially women—will be attracted by some brilliant hue into buying articles whose purchase might otherwise have been long deferred. Moreover, the ability of a domestic appliance to retain its initial colour will provide additional evidence of electricity's cleanliness. One wonders, however, what will be the next step. Will vacuum cleaners be supplied with multi-coloured bags—or will a wide choice of tints be offered, so that between carpet and cleaner there may be complete concord?

Overhead Lines and Amenities.

THERE was a very interesting discussion at the meeting of the Overhead Lines Association at the I.E.E. last week, when several members of the C.P.R.E. and C.P.R.W. were present. It was speedily made evident that there is no real barrier to collaboration between those who are actively seeking to preserve the beauties of rural England and Wales and those who are engaged in carrying out national electrification. The resolution that was unanimously passed declared that "the C.P.R.E. and the Overhead Lines Association agree to co-operate fully regarding the construction and operation of power lines and arrangements connected therewith." One valuable suggestion which emerged from the discussion (of which we hope to give a full summary in our third annual Overhead Lines Number next week) concerned the possibility of arranging for a local representative of the C.P.R.E. to accompany the electrical engineers in a preliminary inspection of the route of a proposed transmission line, with a view to securing agreement before the plans are finally drawn, and so avoiding delays such as have frequently occurred in the past. Letters which have appeared in the Press lately suggest that in certain cases landowners have been antagonised by surveyors who enter their properties to look over a proposed route without first asking permission to do so. Indifference may easily be changed into hostility by lack of ordinary courtesy.

Oxford Resolutions.

WE are glad to note that the conference which was held at University College, Oxford, on Saturday, took a broad minded view of the question, and devoted no more than a fair share of its time to electrification as a cause of disfigurement of the countryside. Certainly the new roads, roadside garages, advertisements, and unsightly buildings are far more in need of regulation. We find no cause for quarrelling with the two resolutions relating to electrification, inviting land owners and residents to approach electricity supply undertakings "with well considered suggestions as to the placing of poles in such a way as to avoid mutilation of the landscape," and suggesting that the Electricity Commissioners and the G.P.O. should be asked to take into account "the scale and contour of different parts of the countryside which they may find it necessary to punctuate with pylons and telegraph posts, with a view to the avoidance of unnecessary hurt to the beauty of the landscape." Electrical engineers are very far from being blind to the unmatched beauties of the English countryside, though the cost factor sometimes compels them to pay less attention to purely æsthetic considerations than they would wish.

ELECTRIC BOATS FOR RIVER SERVICES.

Can Electricity Restore the Thames as a Passenger Highway?—Details of the "Paragon" Thermo-electric System—Regenerative Five-bladed Propeller—Low Fuel Costs.

By Captain WILLIAM P. DURTNALL.

ATTENTION is once again being directed to the use of the Thames through London as a passenger highway and various proposals with this end in view have been put forward. In electrical propulsion we have, I believe, the essential means of making river travel the cheapest and most rapid method of transit in London.

As far back as 1908, after I had been presented with my first gold medal at the Franco-British Exhibition, I was asked to consider a scheme for electrically driven boats for passengers at Venice. Even with the relatively reduced thermal efficiency obtained with Diesel oil engines, as prime movers, the scheme indicated enormous potentialities, but today, with the very much higher thermal efficiency, and the silence in operation

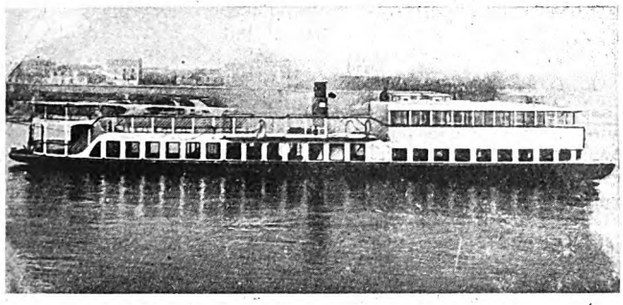

Fig. 1.—A river steamer on the Seine.

that can be obtained with the "Paragon" Super-Diesel Heat Cycle, the possibilities are superior to those of any form of steam heat. The "Paragon" engines which are proposed for use in my Thames passenger electric-boat scheme will have at least the highest thermal efficiency possible.

Another important feature in the development of the "Paragon" boats, is the new regenerative, infinitely variable speed control which is embodied and has been very successful in all my "Paragon" electric locomotives. This system is essentially a storage of energy, that is to say, the plant embodies the electrical storage accumulator. The combination of internal-combustion engines and chemical storage of electrical energy for such a variable load-factor as obtain in river passenger boat traffic, plays a most important part in the commercial aspect.

After much testing and investigation I have found that the mean load-factor of such short period propulsion may be anything from 25 to 50 per cent. of the total power capacity of the boat. A proper time-table has to be adhered to on a tidal river and, at the same time, the general traffic on the river necessitates much slowing down and pulling up, as is the case also in connection with street traffic. There is also the pulling up and stopping at the various landing stages and the time taken by the passengers in landing and embarking. The variable load factor is of course easily met in the case of steamboats, as they have great heat storage in their boilers and, in the event of too much heat energy being generated under times of light load, they simply lift their safety valves and blow it to waste in the air. In the case of the ordinary motor-boat the internal-combustion engines are simply throttled down; this means that bad compression and inferior ignition result, with smoky and noisy exhausts, often misfiring and vomiting out clouds of filthy products of incomplete combustion involving waste of fuel and high operating costs.

Constant Load.

The "Paragon" system overcomes all these bad operating features by simply using the super-Diesel heat-cycle previously mentioned, which avoids the troubles of incomplete combustion and has much higher thermal efficiency than Diesel or other heavy oil engines. At the same time the load on the engines is kept constant, which means that the lowest possible consumption of fuel is used. All these advantages are the direct result of such thermal improvements and of the fact that efficient chemical storage of electrical energy is efficiently secured by the inclusion in the system of the well tried and reliable steel alkaline electrical storage accumulator, introducing also a factor of safety by reason that operating power is always available whether the internal-combustion engines are in operation or not.

The hull design of the "Paragon" boats is of more than passing interest, and is also the result of many years of practical study and experiment with a view to obtaining a suitable public water vehicle. The lessons from the great disaster of the *Princess Alice* have been thoroughly studied during the evolution of these improved hull details. The present design for the proposed fleet of 42 sister vessels indicates that they will be single deck, double saloon type vessels, 140 ft. long, 22 ft. beam, and drawing about 30 in. of water when loaded with 300 passengers. All passengers will be carried above the water line, and the propelling machinery, the storage accumulator and the auxiliary machinery will be installed in the various water-tight compartments into which the whole hull is divided. It would be a very difficult thing to sink these vessels, and this is a factor of the highest significance from the public safety aspect, quite apart from the rapid and unique control. Thanks to modern and strong electrical welding, these hulls will be light but will also have (owing to their cellular construction) the maximum of strength. Owing to their special form, they will pass through the water with the least resistance and almost complete absence of wash.

Propelling Mechanism.

They will be twin-screw vessels and the "Paragon" propelling motors will be of special construction with a 1 hour rating of 150 shaft H.P. at 150 r.p.m., with bar windings, operating on low voltage. The large amount of regenerated energy available when checking the momentum of the vessels when pulling up at landing stages and other places is returned to the steel alkaline accumulator and this allows of a great reduction in the rated horse-power of the oil engine prime-movers. These engines will be of my latest three cylinder, two-stroke type, with separately compressed combustion air and running at 700 R.P.M.; there will be two such engines, each direct-coupled to the latest type "Paragon" Electro-Kinetic transformer, through a hand-wheel operated multi-

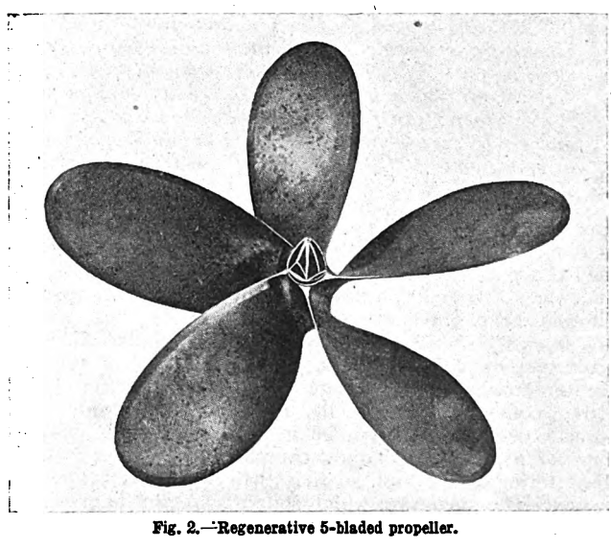

Fig. 2.—Regenerative 5-bladed propeller.

plate clutch. (This clutch is only used for starting the engines and for taking the drive from the engines to the transformers when they are in operation as the boat may be operated without the use of the engines for short manœuvring, the transformers being run continuously).

The propellers which will be used are of the "Paragon" regenerative type, and these interesting 5-blade screws are of special construction of the finest mixture hard metal. They are so arranged that they form water turbines when being dragged through the water by the way of the vessel, when stopping or slowing down at landing stages and so on, the infinitely variable voltage supplied to the propulsion motors, causing the propellers to drive the armatures as generators. The torque set up slows the blades and so the

Digitized by Google

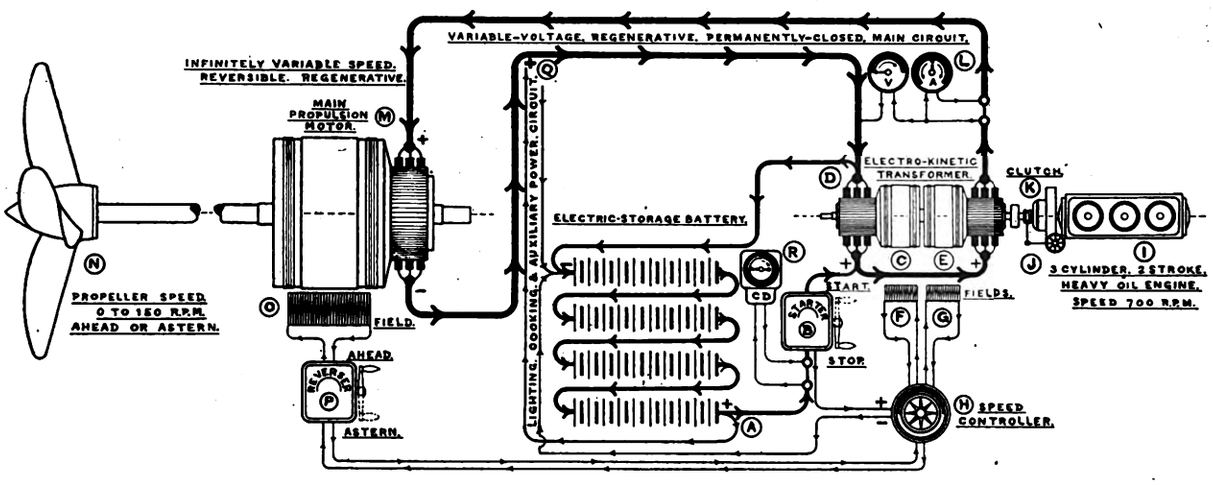
vessel is braked, even down to stand still, the pressure of the water then being in front of the propeller blades instead at the back as when propelling, and the rotation being in the same direction, so that very little live energy will be used in stopping the " Paragon " vessels. Reversing is very quickly obtained by reversing the propelling motor fields, this being carried out sparklessly and accurately by means of a potentiometer balanced resistance. Fig. 2 shows one of my experimental regenerative 5-bladed propellers, which has been the result of much expensive research work during the last twenty years. The diameter of the twin propellers will be approximately 48 in., port and starboard propellers turning in opposite directions. They will be arranged in a particular way at the stern without any brackets (decreasing resistance) and between the three rudders, giving very fine steering control.

The main circuit between the transformers and their propelling motors will be never opened, so that there will be no flashing or burning contacts. The operating is silent and effective, and embodies navigating features which are appreciated by many in charge of vessels which have to be handled in various tidal waters, in the fact that, although the prime-mover oil engine will always operate at one constant speed (or approximately so) the propellers may be driven at any particular speed which may be desired. It very often happens that the port side propeller has to be driven slightly faster than the starboard side propeller or vice versa, in order to get the best out of the boat with the slightest use of the helm and this is easily obtained in the " Paragon " infinitely variable speed system. The engines are 60 B.H.P. each, and the storage accumulator is of 900 ampere hour capacity on the five hour rating, consisting of 144 cells, made up in 4 batteries each of 36 cells permanently coupled in series of 175 V., split up in four of the many water-tight compartments and spread about the interior of the hull, so that their weight is balanced and provides the means by which sound trim can be given to the vessel. The accumulator provides the energy reservoir for both port and starboard power plants, and also for the general power supply for the auxiliary machinery, lighting, steering, pumping, cooking and heating, etc., as well as the exciting energy for both the electro-kinetic transformers and the two main propelling motors. Over the top of the crates the cells stand about 30 in. high, and in their three cell crate units they weigh 420 lb., or for the 48 crates, a total weight of 9 tons. The cell compartments will have forced ventilation discharging through a vent shaft flush with the roof of the bridge amidships, from which shaft the exhaust from the two engines will also be discharged. At both bow and stern powerful searchlights will be fixed, their beams being controlled from the navigating bridge. Both saloons will be equipped with radio receivers.

These electric boats would be in public service on an average 16 hours per day, operated by two shifts of crew, and maintaining a close headway timetable. With top speeds of about 14 miles per hour, it is estimated that the variable load during the day's work will be approximately equal to 1 600 shaft H.P. hours. A large amount of acceleration energy is in this system recuperated and returned to the accumulator for future use, and the two oil engine prime-movers will generate no less than 1 920 brake H.P. hours, so that the accumulator would come in to moorings at the end of the 16 hour day's duty, in just about the same charged condition as it went out at the beginning of the day. Should it be slightly run down, owing to heavier duty than usual, it is only a matter of leaving the engines running a little longer to bring the accumulator up to its full charge condition.

The oil engines working under this system operate at all times at full power and speed (if they are not contributing to the propulsion load they are charging the accumulator and this operation is quite automatically carried out) consequently the engines always run on the very lowest fuel consumption at all times, whether the boat is moving or not. As the late Captain Riall Sankey stated in his report on the heat cycle used in the " Paragon " Super-Diesel heavy oil engines, the thermal efficiency is higher than that of the ordinary Diesel engine. Based on my past experimental work on actual oil engines operating on my cycle I am well within the mark when I estimate that the fuel consumption per hour will be 36 lb. or, say, 68 gallons per working day, which at 4d. a gallon means a fuel cost per day of only £1 2s. 8d. This is a much lower fuel cost than that of any other similar 300-passenger river service boat in existence, far away below what is possible with any steamboat, and a long way below the cost with any ordinary Diesel motor boat.

DIAGRAM SHOWING PROPELLING MECHANISM OF THE "PARAGON" BOATS.



(A) Positive terminal of accumulator; (B) starter for electro-kinetic transformer; (C) primary armature of electro-kinetic transformer; (D) negative terminal of (C); (E) secondary armature of electro-kinetic transformer; (F) field winding for (C); (G) field winding for (E); (H) main propulsion motor speed controller; (I) three-cylinder two-stroke " Paragon " heavy oil engine; (J) hand-wheel for operating clutch; (K) multiplate clutch for coupling engine to shaft of electro-kinetic transformer; (L) positive main leading to main propelling motor; (M) positive terminal of main propelling motor; (N) screw propeller; (O) field winding of main propelling motor; (P) reversing potentiometer switch in field circuit of main motor; (Q) auxiliary light and power circuit, direct from accumulator; (R) is a charge and discharge indicating A H meter.

Lubrication costs will be very low also, all the bearings being of the S.K.F. roller type, running for long periods without attention. These will be, of course, grease lubricated, but the engines would have forced pressure oil lubrication, used over and over again after passing through a separator, and having been water cooled. During my Service career I have often noticed how silently and beautifully the plant operates in a submerged submarine, and these modern " Paragon " vessels should be the most silent, most cheaply operated and most reliable passenger carrying vessels in the world. The accumulators will last for the whole period of the official life of the vessels. Depreciation is calculated at the rate of 7½%, or a working life of 13⅓ years, which is reasonable in the particular conditions under which they will be operated.

The individual parts comprising all the propelling machinery are all of such small unit construction that any individual part of the plant may be very quickly pulled out of the vessel, and a new part installed. Few spare parts need be kept in stock and the vessels will be relatively cheap to build.

In operating the engines the starter (B) is first pulled over; current flows from (A) through starter and to and through

Digitized by Google

windings of (C) to terminal (D) and back to the negative pole of the accumulator. The clutch (K) being out, the electro-kinetic transformer, which consists of the two armatures (C) and (E) coupled mechanically together on their one shaft, now runs as a motor, the armature voltage from (E) opposes the battery voltage, so that no voltage is across the main propelling motor armature. Starter (B) also turns on current to the three fields (F), (G) and (O). Assuming that the accumulator wants a small charge before the vessel starts to work, oil fuel is turned on to the fuel pumps of engine (I), and wheel (J) gently turned, which drops the clutch (K) in and connects the crankshaft of the engine to the revolving shaft of the electro-kinetic transformer, resulting in the engine being turned against compression; the fuel is immediately injected by the pumps, and the engine begins to fire; delivering its power to the transformer shaft it causes both (C) and (E) to act as generators; (E) opposes (C) but (C) immediately begins to deliver current from its positive terminal through starter (B) to the positive terminal of accumulator (A) through accumulator to its negative pole and then on to terminal (D) of armature winding (C). As soon as the charge and discharge ampere-hour meter (R) indicates that the accumulator is fully charged the vessel is ready to start.

It will be observed that the two sister armatures (C) and (E) are mounted on one shaft, and are indeed mechanically and electrically coupled together, with the armature of the main motor in the closed armature series circuit. The operation is very similar to that which takes place when two sister machines are put under a Hopkinson test but, in this case, we have the armature of the main motor in circuit as well, as we only require a very low voltage, but a very heavy current, at starting the main motor; this is secured with great economy of both electrical and mechanical energy. The hand-wheel of the speed controller (H) is now gently turned to the right, this drops a small amount of shunt resistance in the field (G), the armature (E) immediately tries to rise in speed and a heavy torque is set up through the armature shaft between (C) and (E); there is a slight change in speed and a heavy current is set up in the permanently closed main circuit running from positive terminal of armature (C) across to the positive terminal of armature (E) from there on to the positive terminal of main motor at (M) across same to and from its negative terminal, back to terminal (D) of armature (C). This current sets up the necessary torque on the main motor and propeller shaft and the motor runs at a low speed, say in the "Ahead" direction. It may be assumed that the power required is 20 H.P. in the main motor closed circuit (for simplicity generator losses are left out in this description), the engine being 60 B.H.P., and previously giving this power to charge the accumulator. The propeller is now running and using, say, 20 H.P., the rest is going to the accumulator. As the wheel of the speed controller (H) is further turned to the right, the field (G) is still further weakened until it is at zero, the whole of the power of the engine is now taken up by the armature (C) which delivers the full engine generated current to the main circuit at, say, 175 V, the main propelling motor runs up to, say, 75 r.p.m., the 175 V accumulator being across the terminals of the armature. The vessel is now moving at about half speed and requiring only about one quarter of the electrical power which it needs at top speed. It can be assumed that the speed controller is about half way round.

Economy of Energy.

To obtain full speed on the main propelling motor, the speed controller wheel is turned gently to the extreme point of its travel to the right; this movement brings in the excitation on the field (G) again but the excitation is in the opposite direction, so that the armature (E) now acts as a generator and boosts up the voltage from armature (C) until the voltage delivered to the armature of the main propelling motor is, say, 350 V and the speed of the propeller is 150 r.p.m. The power now required in the main propelling circuit is, say, 150 H.P., and of this 60 H.P. comes from the oil engine and the balance from the accumulator. The armature (C) now delivers power to the shaft mechanically coupling the two armatures of the electro-kinetic transformer together; it draws current for so doing from the accumulator across its terminals. The full voltage of 350 which is delivered to the main motor terminals is composed of 175 from the accumulator plus 175 from the armature (E) of the transformer, which is electrically coupled in series with the main motor and the accumulator.

No main resistances are used, and the whole system works with very great economy of energy, whether this energy be supplied at low vessel speed entirely by the oil engine, or by the accumulator for short runs. The whole propulsion can, of course, be obtained from the accumulator without the use of the engine. It is indeed an accumulator system of operation, the functions of the oil engine being simply to apply power to the shaft between the two armatures (C) and (E) for charging purposes, or to assist in providing the total power for full speed.

BOOK REVIEWS.

Questions and Solutions in Magnetism and Electricity. By W. J. WHITE. 3rd. Ed. (London: Sir Isaac Pitman and Sons.) Pp. vii+178. 5s. net.

This book supplies the answers to the questions set by the Board of Education and the City and Guilds examinations, in Grade I, from 1907 to 1913 and 1919 to 1929 inclusive. The questions have been thoroughly dealt with and in some cases too fully for the needs of the examiner. This, however, is an advantage rather than a disadvantage to the student, who will, no doubt, recognise the author's reason for doing this.

Generally speaking, it should be invaluable to students in this Grade, not only for the information given, but also as a model for the way in which questions should be answered.

Private Branch Automatic Exchanges. By R. T. A. DENNISON. (London: Sir Isaac Pitman and Sons.) Pp. ix+291. 12s. 6d. net.

Although there are numerous books on the market dealing with the subject of automatic telephony, none of them have dealt very extensively with the subject of Private Branch Exchanges. The volume under review is entirely devoted to this type of telephone exchange and contains descriptions of the four main types used by the British Post Office.

The first system described is the Relay Automatic, in which, of course, the whole of the selective operations are performed by groups of relays, no other mechanical apparatus being employed for the purpose. This system has been very clearly and thoroughly dealt with, and the functions of each group of relays detailed.

The next type is that of the Standard Telephones and Cables, viz., the rotary system. This chapter contains a description of the various pieces of apparatus employed and also a summary of their operation.

Following this are two types of Private Branch Exchanges which are, in each case, based upon the Standard Strowger system of automatic switching.

In all cases the circuit's operations have been traced step by step. Practically throughout the book the inset diagrams have been placed with sufficient regard to the need for continuous reference between them and the text. The book is undoubtedly one of the most up-to-date on the subject, and as both a reference book for engineers and a text-book for students should have a wide sphere of usefulness.

Radiotechnik. VI: DIE ELEKTRISCHEN WELLEN. By Dr. F. KIEBITZ. (Berlin and Leipzig: W. de Gruyter and Co.) Pp. 125. 1.50 marks.

This small book is the sixth volume of a series on radio technology issued in the "Sammlung Göschen," and deals with Hertzian waves—in particular the waves of radio-telegraphic value. The author, as Professor at the University of Berlin and as Director of the Radio Department of the German Post Office, is eminently qualified to present a book well balanced between the theoretical and the practical. He has written an admirable monograph with a philosophical method of treatment. A good foundation of modern electrotechnics is demanded in the class of reader to which the book is addressed, namely, engineers, teachers and students, or amateurs who require a wider understanding of the underlying principles of radio transmission and reception. Dimensional considerations of units are followed by a treatment of the electric and magnetic fields of antennæ on a Maxwellian basis. The results and interpretation of the experiments of Hertz lead to a consideration of damped oscillatory circuits, aerial characteristics, wave propagation, and the functions of the earth and of the atmosphere in wave transmission. A number of fundamental formulæ are presented, always with practical calculation in mind. Examples are taken mostly from the sphere of broadcasting, but a chapter on directional antennæ is included. The book can be recommended as a good example of what a monograph should be.

ITALY'S SUBMARINE CABLE SYSTEM.*

North and South Atlantic Routes—Design of Cables—Relays and Regenerators—Use of Baudot Distributor—Synchronisation Possibilities.

By A. L. OSTI.

THE "Italcable's" (Italian Cable Company) system of transoceanic communications comprises two entirely separate lines: one to North America and the other to South America. The Northern line consists of one cable (in two sections, Anzio a Malaga and Malaga–Horta) over 2 324 nautical miles (about 4 308 km.) in length, joining up with the Western Union and Commercial Cable Companies' cables and forming, in fact, one system with them. This explains the generous assistance given by the Western Union to the "Italcable" in its initial organisation, by supplying data, suggestions and the necessary technical assistance.(1)

South American Routes.

The other line, to South America, over 7 294 nautical miles long (13 548 km.) may be considered as composed of eight sections of cable in series with each other, forming a direct connection between Italy and Spain on this side and Brazil and Argentina on the other side of the Atlantic. This line is, therefore, independent of any other system. The characteristics of all the "Italcable's" installations must, in view of their future employment, necessarily fall into two standard types: the American or North Atlantic type, on which they were to be grafted, and that of the British world system typified by the Eastern Group with which they had to compete. The former is characterised by a bundle of parallel cables, one acting as a reserve to the other, working in identical conditions between the same terminals, ready to deal with very considerable peak traffic loads in a brief working period, and permitting a constant and very convenient rotation of the apparatus on the working circuits. The British system consists of a long series of cables and stations adapted to working continuously either between terminal or intermediate stations.

The "Italcable" was obliged to conform to these different conditions in the first instance with the intention of evolving later on, when more experience had been gained, an essentially typical and characteristic system of cables and installations of its own. The assistance of the oldest firm specialising in cable projects then in existence and at the height of its prosperity, Messrs. Clark, Forde and Taylor,(2) consulting engineers to nearly all the cable companies of the world and to many government administrations, enabled the "Italcable" to gather the necessary information for carrying out the first installations.

Until a few years ago it was the prevailing practice in technical circles to design cables suitable for the traffic to be dealt with by computing the transmission solely on the basis of the geometrical data of the cable core. Messrs. Clark, Forde and Taylor pointed out at once the necessity for taking into account the terminal conditions of the various sections.(3) This firm was, in fact, headed by Mr. Heurtley who, by the introduction of his magnifier, the extension of double sea earths (4) and the special precautions taken in balancing them,(5) had been successful in obtaining two successive increases of speed each giving from 20% to 40% gain over the figures computed by means of the old scholastic standard of the characteristic constants. (KR.) (6)

Further, as regards the South American cable, a rapid increase of traffic had to be anticipated in consequence of the creation of an independent system of communications for the Latin peoples; the necessity for maintaining such communication at full efficiency even when the insulation condition of the cable over a line of such length might be defective had to be considered. Fortunately the ability of the Government Administration's engineers who presided then (and still preside) over the making of the contracts between the company and the Italian Government, made it possible to present the problems in the light of the new standards. The expectations based on the latest improvements to the apparatus and installations proved to be well founded and the most perfect system of the Kelvin type of cable was evolved.

At any rate the geometrical characteristics computed by using the formulæ adopted by Clark, Forde and Taylor, taking into account the type of stranding selected for the copper conductor, the quality of the gutta percha, the destination of the cable, the depth and temperature at which it would be laid, proved entirely in accordance with the practice of the three firms who competed for the manufacture of the Italian company's cables, offering as they did a sufficient margin of tolerance between the specified limits and the conditions obtained. The said firms, however, did not take advantage of these tolerances and the resistance and capacity values they supplied were considerably below those considered, so that the characteristic constants obtained were perceptibly lower than those specified by the company and the Italian Government. The sheathing types were also somewhat liberally computed so as to give the line the greatest possible stability. The sheathing wires in particular were proportioned by Messrs. Clark, Forde and Taylor to the nature and depth of the bottom with a generosity quite unusual with the short cables to which we Italians had been accustomed, a generosity also made possible by the greater power and perfection of the paying-out and picking up machinery of our days. Iron wires of No. 1 B. SWG (0·300 in.) are used to a depth of 100 fathoms; at 500 fathoms wire of No. 6 BSWG (0·200 in.) and cable weights of over 4½ tons per nautical mile are still to be found, and only beyond 1 100 or 1 200 fathoms depth is the actual deep sea type met with: a light cable with steel wires of No. 13 (0·095 in.) and about two tons per nautical mile.

As to the degree of perfection attained by the paying out machines, it will be sufficient to point out that whereas hitherto average slacks ranging between 10% and 12% were usually provided for this percentage has been reduced to a mean of 7%, thanks to the use of taut wire measuring gear, automatic brakes and other well-designed controlling arrangements.

That these standards constitute the theoretical and experimental basis of a genuine engineering technique is proved by the fact that projects prepared simultaneously and independently by the "Italcable's" engineers and by the consulting engineers in England in connection with the recently laid Anzio-Barcelona and Malaga cables evinced such a striking similarity of results that the lengths of the route differed by less than 1% of the total length of the line, namely, by less than 8 miles over a length of 1 100 nautical miles. On the other hand, the allotment of the types was governed by views so nearly identical that the difference in the cost of manufacture as estimated by the "Italcable" in their project and the actual outlay hardly reached 1 per thousand.

Use of Sonic Depth Finders.

The precautionary measures which attended the selection of the route in the first scheme, which culminated in the sounding expeditions of the "Città di Milano," the "Telconia" and the "Faraday," were adhered to in the laying of the more recent cables with the result that the installation of the sonic depth finder on the occasion of the laying of the new Pacific cables on behalf of the four Governments forming the Pacific Cable Board, found its counterpart in the up-to-date equipment of the "Città di Milano."(7)

Thus, whilst laying operations of the short Mediterranean cables were conducted with absolute technical accuracy, it will be possible in the near future to carry out further and very interesting checks on the Werner Siemens' theory and the

formulæ developed by him and used for 54 years for the determination of the depth during laying.

In the selection of the landing places special provisions were made for the effectual prevention of any possible deterioration of the cables whether due to the meteorological and hydrographic conditions of the locality or to the traffic and maritime industry connected therewith. Therefore, in addition to works on land, marking with buoys was resorted to, and suitable gear and spare cable were stored close at hand to permit of carrying out any small repair by local means.

The landing was, whenever possible, selected to be near the office with a view to avoiding long and costly underground connecting lines. Where this was not practicable underground connections were laid, using for this purpose multiple cable having the same number of conductors as the submarine cable and as nearly as possible the same characteristics. Therefore, the underground connection was carried out by means of india rubber insulated lead covered conductors, sheathed with steel tapes or wires, laid into carefully planned trenches, along routes which were selected bearing in mind the necessity of avoiding interruptions from road work, corrosion due to stray currents and, above all, any inductive phenomena from electric tramways or power supply lines running near by. The care taken and the expenditure incurred were perfectly justified by the fact that no trouble of any nature has so far been experienced along any of the installations so planned and carried out, with the exception of induction experienced in Barcelona where, in 1927, we were compelled to follow an electric tramline for over one-third of the total length of the underground line. This trouble was eliminated by following, perhaps for the first time in telegraph cable technique,(8) the practice adopted for some time past in connection with telephone cables, that is, by connecting in one circuit the protective lead covering, the sheathing, the return conductors of the tramline and at the same time establishing reliable earths.

It was decided from the very first that the Northern and Southern cables were to make up two independent and uninterrupted communication lines, and therefore the intermediate stations were to be equipped for relay transmission and signal regeneration. This implied, of course, the adoption of the most up-to-date high speed and long distance apparatus, electromechanic magnifiers of the latest type, Brown or Heurtley relays and Western Union or other special type of regenerators.(9)

Matters were easy enough with regard to the Northern cable destined to make up a single system with that of the Western Union and so provide a direct line between Rome and New York; not only because the agreements made with the associated companies guaranteed the unrestricted co-operation of their experts for carrying out the installation and supplying the necessary staff, but also because in any case manual retransmission had been provided for at Horta, and there was in consequence only one relay station to be worked. Nevertheless, both at Anzio and Horta, service had perforce to be commenced in March, 1925, with temporary installations and without magnifiers; but after only five months, when the Italian station at Anzio was ready in its permanent form with magnifiers in use, transmission speed increased over 33% as compared with that at first obtained. At Malaga the installation had been completed even earlier and regenerators of the Western Union type inserted. This was a new and brilliant extension of the employment of the Baudot rotary distributor for submarine cables for the retransmission of the previously amplified and repeated signals, making use of local circuits which were entirely independent but operated automatically in perfect synchronism with the incoming signals. In the "Italcable." system the application of the Baudot distributor was at first limited to the simple regeneration of signals—i.e., to the synchronous retransmission of signals of perfect shape and amplitude over an entirely independent circuit in place of the magnified and corrected but still distorted incoming signals.

As soon as the application of the regenerator was effected, it occurred to the "Italcable," as a natural consequence and further development, to adopt multiple transmission and reception by fully utilising the Baudot distributor, and there-

fore, as had already been done by the Western Union on some of their Northern cables, the "Italcable" proceeded to instal a two-channel system on the Anzio-Malaga-Horta cable.

In practice, however, the problem the "Italcable" proposed to solve was of a quite different nature from that solved by the Western Union. The Anzio cable was the only one at the time connecting Malaga to Italy, and had therefore to serve both the Northern and the Southern line to Rio Janeiro and Buenos Aires. One channel should therefore continue working as before as a single cable between Anzio and Horta, whereas the other could be interrupted at Malaga, thus permitting the traffic between Italy and South America or Italy and Spain on one side, and that between Spain and North America on the other side, to be handled independently.

Complex Technical Arrangements.

Thus on the Northern cable also the different nature of the two systems, "Italcable" and "Western Union," began to assert itself. It was no longer a route between terminals connected up at the intermediate stations, but a route having much more complex characteristics, requiring more complex technical arrangements to secure the perfect synchronism and phasing necessary for transmission at the intermediate and terminal stations.

As regards the Southern Cable, thanks to the co-operation of Messrs. Clark Forde and Taylor and the general good will of the engineers and officials distributed along the route, the line was ready for relay working less than nine months after the Southern cables were laid.

Less than one month after the inauguration the Heurtley-Foll regenerator(10) was tried out at St. Vincent, an apparatus also based on the synchronous substitution of signals passing from one cable to the other, but employing a system of contacts and cams driven by one and the same mechanism in lieu of the usual distributor rotating on concentric contact rings. Between November, 1925, and April, 1926, all five stations between Malaga and Buenos Aires were working regenerators.

Meanwhile experiments were made and are still being made for a gradual increase of the transmission speed, this being necessitated by the ever-increasing traffic requirements, and to ensure in the case of the Southern line also rapid handling of big volumes of traffic that are characteristic of certain times of day, especially in the event of unusual occurrences.

Reverting to the South American cable proper—i.e., the Malaga-Buenos Aires section—traffic transmission by regenerators and relays over this line has been obtained having special regard to the possibility of local transmission of the Spanish and Brazilian traffic which it was the duty of the "Italcable" to carry as well as the Italian and Argentine traffic.

For this purpose special mechanisms were studied and adopted (by actual synchronising retransmitters) to prevent the disturbances due to these insertions of traffic affecting the synchronism of the whole system and to maintain the same amplitude and shape characteristics for signals whether arriving from the terminal or intermediate stations.

The necessity for utilising the highest speeds obtainable without relinquishing the regeneration of signals and preparing for further traffic exchanges and the working of duplicate cables led to the study of a perfect method for obtaining synchronism between all the apparatus working on a cable or system of cables. For this purpose a synchronising system independent of signals has already been installed on the Anzio-Barcelona-Malaga cables (11) based on the continuous transmission over the cable of an alternating current at a conveniently determined frequency intended to drive the tuning forks controlling the phonic motors which operate the transmitter and regenerator distributors. Two-channel multiple transmission is already being worked over these cables, and four-channel transmission will soon be effected. It will then be possible, if so desired, to proceed with an entire division of traffic over the circuits, either according to destination and origin or according to the various classes of traffic.

It strikes one immediately that this first application of the independent system of synchronism opens the way to a great number of technical and traffic possibilities which can be obtained by extending this installation to other cables; and if, after this report of our achievements, we may be allowed to mention what we consider feasible in a not far distant future, we will state that it will then be possible to maintain in phase all apparatus working over cables synchronised by a regulating centre irrespective of the signals actually travelling on the cables, thus facilitating enormously the exchange between the various lines of traffic which it will be possible to achieve without disturbing the technical working.

In fact, if compared with existing conditions, the system will acquire a flexibility permitting it to meet widely differing contingencies without endangering its organic compactness.

The station transmitting the synchronising alternating current will be the sound heart dwelling in an exceptionally robust body, the circulation of which will be rendered absolutely independent of the particular activity of the various nerve centres constituted by the stations.

In addition to land lines in Italy, the "Italcable" has provided a system of direct connections for its exclusive use in Spain, Brazil and Argentina as well as in the Atlantic islands. The total length of the various landline systems now exceeds 7 900 km.

The Anzio-Palermo Cable, over 219 nautical miles in length, has been made part of the Italian landline system, and the same applies to the Palermo-Cagliari cable now laid. These cables are, and will be, worked Baudot, so as to be easily connected up to the company's and the Italian Administration's landlines.

The development of traffic has not only been up to expectations, but has also justified the foresight whereby the company in good time asked for and obtained further grants for the provision of a new system capable of meeting future requirements in world communications. A cable has been recently laid between Malaga and Lisbon, and concessions have already been obtained for cables between Lisbon and North Europe, Bilbao-North Europe, for a new Italy-Azores cable, a second Buenos Aires-Rio Janeiro cable, and a cable between Horta and St. Vincent.

HYDRO-ELECTRIC PROGRESS IN CANADA IN 1929.

5 727 600 h.p. already installed.

THE Dominion Water Power and Reclamation Service of the Department of the Interior of Canada has issued its Annual Review of Hydro-Electric and Water Power Developments in Canada during 1929. The statement shows that the activity which has been so evident in recent years has been fully maintained and the amount of water-power now under construction and projected indicates that this will continue for some years to come.

The total amount of new installations brought into operation during 1929 amounted to 378 400 H.P., bringing the total installation for the whole Dominion to 5 727 600 H.P. Undertakings now under construction will, according to the programme proposed, add more than 1 600 000 H.P. to this total during the next three years.

The Shawinigan Water and Power Company is now actively engaged on the extension of its power resources from the St. Maurice River, and has completed another long-distance transmission line 67 miles in length from the City of Grand' Mère to La Tuque. This represents the first completed portion of the project designed to bring the immense power resources of the Upper St. Maurice River to the service of industry in Quebec. The new transmission line is designed to carry 200 000 H.P. at 250 000 V, but in the first instance the line is carrying power in the reverse direction at 66 000 V from the Laurentide hydro-electric power Station at Grand'Mère to the pulp and paper mill of the Brown Corporation at La Tuque, a station on the National Transcontinental line of the Canadian National Railways. The line is carried on galvanised steel towers, 90 ft. high, placed six to the mile. The route was located by aerial photography. The programme on which the Shawinigan Company has embarked will call for the investment of $100 000 000 in the next ten years. These new projects on the upper St. Maurice will add 600 000 H.P. to the system which to-day has available 806 000 H.P. The company supplies hydro-electric power to some 350 communities in the province of Quebec.

The Southern Canada Power Company has submitted to the Quebec Government plans for the construction of dams and a generating station near Spicer Rapids on the St. Francis River, over large stretches of which the company owns riparian rights. The present plans will involve the expenditure of approximately $6 000 000, and the plant is expected to have a capacity of 50 000 H.P.

MEASUREMENT OF HIGH RESISTANCE BY LOSS OF CHARGE METHOD.

Limitations of Direct Deflection Method—High Resistance with Very Low Capacity—Effect of Absorption on Result of Test.

By S. T. GASKIN

THE object of this paper is to describe the loss of charge method of measuring high resistances which are beyond the scope of the direct deflection method; to consider what modifications are necessary in the special case of high resistance associated with very low electrostatic capacity; and to examine the conditions which permit a simple formula to be employed with a practical degree of accuracy.

As the loss of charge method is of particular utility to the telegraph engineer, the examples given refer to telegraphic work. The method is, however, easily and quickly applied to other work.

The simple direct deflection method can be employed for measuring high resistances, the value at which the current flowing through the galvanometer becomes too small to produce a deflection which can be observed with sufficient accuracy. This current depends upon the battery available, or permissible, and the sensitiveness of the galvanometer.

The normal Sullivan universal galvanometer, for example, has a figure of merit of 0·02 micro-amperes approximately. When fitted with a special suspension in which the coil is suspended from above, connection being made to the lower end of the coil by means of a non-directive, open phos.-bronze spiral, the figure of merit becomes 0·001 micro-amperes approximately.

Degree of Accuracy.

If the accuracy of measurement is to be within 10% and the deflections can be read to half a division, then 5 scale divisions is the smallest permissible deflection. This will be produced by a current of 0·005 micro-amperes, assuming that the special suspension is in use.

Under these conditions, the highest resistance which can be measured is given by the voltage of the testing battery divided by 0·005.

Frequently, it is not convenient to use more than 200 V, even if permissible, and therefore 40 000 megohms is the highest resistance which can be conveniently measured by the direct deflection method.

Very much higher resistances can be measured by the loss of charge method, described below, using a battery of moderate voltage.

In this method, a charge is allowed to escape through the high resistance to be measured, and the ratio of the initial quantity of the charge to the quantity after a suitable interval of time has elapsed is determined by observations with a ballistic galvanometer.

As the capacity which contains the charge remains constant, these quantities are proportional to the potential of the charge, and therefore the value of the high resistance can be calculated by means of the well-known formula :—

$$R = \frac{0{\cdot}4343t}{K \log \frac{V1}{V2}} \text{ megohms.}$$

where $V1$ = initial potential of charge.
$V2$ = potential of charge after an interval of t seconds.
K = capacity in mfds. which contains the charge.

The following is an example of the method, when the high resistance to be measured is the dielectric of a condenser (see Fig. 1) :—

1. Apply battery for 20 seconds, by closing keys A and B. Note charge throw ($V1$) on galvanometer.
2. Insulate condenser for one minute by opening key B.
3. Apply battery again by closing key B, noting recharge throw. Then $V2 = V1 -$ (recharge throw).

Let a charge throw of (240×10) and a recharge throw of (14×1) scale divisions be obtained when a 1 mfd. condenser is tested.

$$\text{Then } R = \frac{0{\cdot}4343 \times 60}{1 \times \log \frac{2400}{2386}} = 10380 \text{ megohms.}$$

This procedure is suitable so long as the capacity of the condenser is high enough to enable charge and recharge throws to be taken with sufficient accuracy, the period of insulation being chosen to suit the rate of discharge.

When, however, a high resistance associated with a negligible capacity (such as the insulation of a joint in a very short length of core) is to be measured, certain modifications are essential.

(a) *First Method.*—Take a good mica dielectric condenser and test for insulation by the loss of charge method, as above. Then, after thoroughly discharging, connect the unknown high resistance in parallel with it and take another loss of charge test.

The second result will be the joint resistance of the condenser insulation and the unknown resistance.

Now if r = the unknown resistance,
and R = the insulation resistance of condenser,

$$\text{Then } r = \frac{R \times \text{joint res.}}{R - \text{joint res.}}$$

This method can be quickly applied, but involves a lot of calculation, and although it is perfectly accurate in theory, errors are liable to occur owing to the effect of absorption in the condenser dielectric.

Fortunately, both of these objections may be disposed of by adopting the procedure described below.

(b) *Second Method, and Approximate Formula :*

1. Charge the condenser for 24 hours by connecting it to the battery to be used for the test.
2. Take a recharge throw after insulating for one minute. Call this throw d.
3. Connect the high resistance to be tested in parallel with the condenser. Charge for one minute.
4. Insulate condenser with high resistance in parallel for one minute. Then take a recharge throw (D).
5. Obtain capacity constant of galvanometer in scale divisions per mfd.

Then, if t = time of insulation in seconds
and R = resistance to be measured, in megohms.

$$R = \frac{t \times \text{divs. per mfd.}}{D - d}$$

$$\text{or, simply :—Megohms} = \frac{\text{secs.} \times \text{cap. const.}}{\text{divs. due to } R.}$$

Example :—A 1-mfd. condenser was charged for 24 hours. After one minute's insulation a recharge throw of four divisions was obtained. With a yard of faulty I.R. insulated

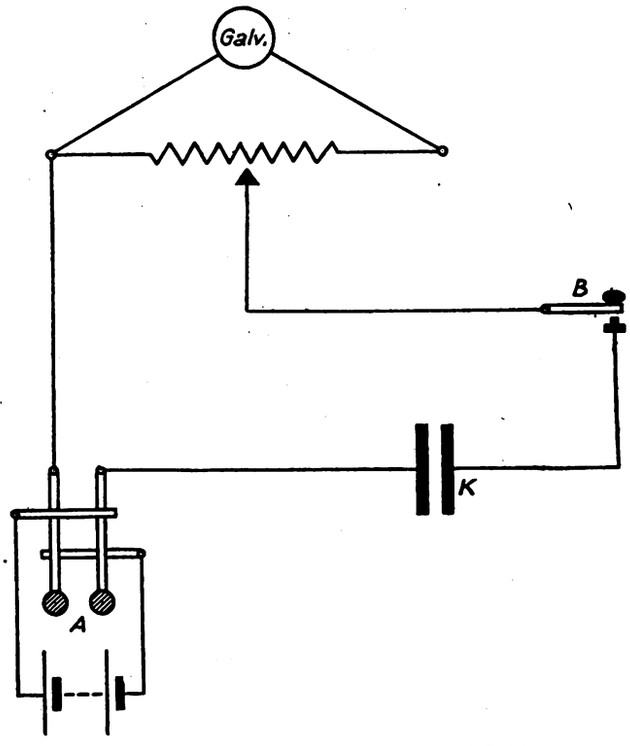

Fig. 1.—Measurement of resistance of condenser dielectric.

Digitized by Google

U.G. core in parallel with the condenser a recharge throw of 14 divisions was obtained. Cap. const. of galvanometer 9 650.

$$R = \frac{60 \times 9650}{14-4} = 57900 \text{ megohms.}$$

Once thoroughly charged, the condenser *must not be discharged* until the test has been completed; then the capacity constant of the galvanometer is conveniently obtained by a discharge throw. Of course, a second condenser can be used, if desired, to obtain the constant.

Theory and Conditions Necessary for Accuracy.

The simple formula given above is not strictly correct and always yields a result which is slightly too high.

However, the conditions for a practical degree of accuracy can be ascertained and are easily obtained in practice.

The theory of this method is that a P.D., which is assumed to be constant, maintained across the resistance to be measured causes a current to flow through it, and the quantity which actually passes is observed, thus enabling the value of the high resistance to be calculated.

But as a charged condenser supplies the P.D., which falls as the charge escapes, the formula given is not strictly correct. It is deduced as follows:—

Let K = capacity of condenser.
V = initial P.D. of charge.
Q = original charge.
q = quantity which escapes.
R = resistance through which q passes.
t = time in seconds.

Then $q = \frac{Vt}{R}$

$$\therefore R = \frac{Vt}{q}$$

V is assumed to be constant throughout,

$$\therefore R = \frac{\frac{Q}{K}t}{q} = \frac{Qt}{Kq}$$

The ratio $\frac{Q}{q} = \frac{\text{charge throw}}{\text{recharge throw}}$

and $\frac{\text{charge throw}}{K}$ = scale divs. per mfd.

$$\therefore R \text{ (in megohms)} = \frac{\text{scale divs. per mfd.} \times \text{secs.}}{\text{recharge throw.}}$$

(This formula is very useful for the general loss of charge test described above, when extreme accuracy is not required.)

Actually, V is not constant but falls according to the law

$$-V_t = V\varepsilon^{-\frac{t}{KR}}$$

where V_t is the potential of the charge after t secs. have elapsed

$$\therefore Q_t = Q\varepsilon^{-\frac{t}{KR}}$$

The error due to this loss of charge and consequent fall in potential can be calculated and a correction applied to the result. It is simpler, however, to use a condenser so large that the error is negligible in practice.

In measurements of this kind, an accuracy of 10% is usually satisfactory. To ensure this, so far as the P.D. across R is concerned, conditions must be such that the quantity which escapes through R is not less than 10/11ths of the quantity which would have passed through R, had the initial P.D. been maintained.

The maximum permissible error therefore occurs when

$$\frac{q}{\frac{Vt}{R}} = \frac{10}{11} \quad \ldots \ldots \ldots \ldots \quad (1)$$

$$\text{But } q = Q - Q_t$$
$$= Q - Q\varepsilon^{-\frac{t}{KR}}$$
$$= Q\left(1 - \varepsilon^{-\frac{t}{KR}}\right)$$
$$= KV\left(1 - \varepsilon^{-\frac{t}{KR}}\right).$$

Inserting this value in (1)

$$\therefore \frac{KV\left(1-\varepsilon^{-\frac{t}{KR}}\right)}{\frac{Vt}{R}} = \frac{10}{11}$$

$$\therefore \frac{KR}{t}\left(1-\varepsilon^{-\frac{t}{KR}}\right) = \frac{10}{11}$$

The Measurement of High Resistance by the Loss of Charge 2

Let $x = \frac{t}{KR}$

Then $\frac{1-\varepsilon^{-x}}{x} = \frac{10}{11}$

$$\therefore 1 - \varepsilon^{-x} = \frac{10}{11}x$$

$$\therefore \varepsilon^{-x} = 1 - \frac{10}{11}x$$

Take logs $\therefore -x = \log_\varepsilon\left(1 - \frac{10}{11}x\right)$

Expand by logarithmic theorem $\left\{ \therefore -x = -\frac{10}{11}x - \frac{100}{121}\cdot\frac{x^2}{2} - \frac{1000}{1331}\cdot\frac{x^3}{3} \ldots \right.$

$$\therefore 0 = \frac{1}{11}x - \frac{100}{121}\cdot\frac{x^2}{2} - \frac{1000}{1331}\cdot\frac{x^3}{3} \ldots$$

$$\therefore \frac{1}{11} = \frac{100}{121}\cdot\frac{x}{2} + \frac{1000}{1331}\cdot\frac{x^2}{3} \ldots \ldots$$

Solving as quadratic

$$\therefore x = 0{\cdot}1975 \pm {\cdot}0005$$

that is $\frac{t}{KR} = 0{\cdot}1975$, nearly.

Hence when $t = 60$, $KR = \frac{60}{{\cdot}1975} = 303{\cdot}8$

This means that when the megohms per mfd. of the circuit considered (i.e. condenser plus article under test) are 303·8, the result given by this simple test, using the approximate formula, will be 10% high; and that an accuracy of greater than 10% is obtainable when the megohms per mfd. exceed 303·8.

Of course, this applies only to tests in which the period of insulation is one minute. For two minutes, the megohms per mfd. must be greater than 608; for three minutes, greater than 912—and so on, if an accuracy of greater than 10% is required.

In practice, the megohms per mfd. must be considered together with the battery to be used and the figure of merit of the galvanometer. A suitable value for the condenser can then be determined. The following examples will make this clear:—

(1) A yard of core taken from a drum of i.r. insulated u.g. landline, which is thought to have an insulation of 500 megohms per n.m., is to be tested.

Approx. insulation of 1 yd. $= 500 \times 2029$
$= 1\,014\,500$ megohms.

Approx. capacity of 1 yd. $= \frac{{\cdot}3333}{2029}$
$= 0{\cdot}000164$ mfds.

It is obvious that this very short length cannot be tested by the direct deflection method; also that the ordinary loss of charge method cannot be employed owing to the low capacity.

A battery of 200 V is available. This when applied for one minute will cause $\frac{200 \times 60}{10^6} = {\cdot}012$ microcoulombs to flow through the insulation resistance.

Period of Insulation.

If the Sullivan universal galvanometer (mentioned before) having a constant of approximately 50 divisions per microcoulomb is to be used, then ·012 microcoulombs will be insufficient to produce a good throw, and a longer period of insulation will be necessary.

If this is made 10 minutes then

$$\text{microcoulombs} = \frac{200 \times 600}{10^6} = {\cdot}12$$

A throw of 5 divisions would be obtained for this quantity.

For a period of insulation of 10 minutes it is desirable that the megohms per mfd. shall exceed 3 038. A very small condenser will ensure this, and there is a slight advantage in

Digitized by Google

using one having the minimum capacity which will satisfy this condition, since the " divisions due to condenser " will then be a minimum. But usually a good mica condenser of 1 mfd. or ½ mfd. capacity is available, and this can be used.

Of course, it would be very desirable in this case to increase the voltage of the testing battery so as to avoid such a long period of insulation.

(2) A rough trial shows that the insulation between two terminals on a certain base-board is about 50 000 megohms.

The same battery and galvanometer as in (1) are available.

Now to get a re-charge throw of 10 divisions, 0·2 microcoulombs must be allowed to escape through the resistance. With a p.d. of 200 volts this quantity will escape in 50 seconds, so that a period of insulation of 1 minute will be convenient.

In order that the megohms per mfd. shall exceed 304, a condenser of not less than $\frac{304}{50\,000} = 0{\cdot}006$ mfds. must be used.

Given then, capacity constant = 10 000 divs/mfd.
condenser re-charge = 2 divs.
condenser plus leak re-charge = 13 divs.

$$R = \frac{60 \times 10\,000}{11} = 54\,540 \text{ megohms.}$$

In general, a good mica condenser of 1 mfd. capacity is suitable for most tests that are likely to be undertaken.

Effect of Absorption on Result of Test.

A condenser is said to have an absorptive dielectric if, when connected to a source of e.m.f. a gradually diminishing current flows after the initial charging current has ceased.

If such a condenser is short-circuited after having been thoroughly charged, a similar diminishing current will flow (in the opposite direction) after the initial discharge is complete.

Therefore, if an absorptive condenser is tested by the loss of charge method after it has been short-circuited for a long period, the result will not be the same as that obtained by a similar test after the condenser has been charged for some hours, or even minutes.

For, in the former case, during the period of insulation, an absorption current will flow as well as the true leakage current, causing the apparent loss to be greater than the true loss. This produces a low result.

And in the latter case the absorption current will be small. Hence, the apparent loss of charge will be nearly equal to the true loss due to leakage through the insulation resistance, and the result will be higher than in the former case.

Actual figures obtained with a good 1 mfd. mica condenser were :—

18 200 megohms after 1 week short-circuited.

$2{\cdot}25 \times 10^6$ megohms after 24 hours charging at 75 V, and with a paraffin paper condenser (1 mfd.) :—

3 430 megohms after 1 week short-circuited.

240 000 megohms after 48 hours charging at 180 volts.

In the special case—second method—described above, it is imperative that the condenser be charged long enough to ensure that the absorption current has practically ceased.

And in the ordinary loss of charge test of condensers, etc., consistent results will only be obtained if the condenser is short-circuited for a definite period before each test, and a proper interval of electrification chosen.

If there were no absorption, the intervals of electrification and insulation would be unimportant, the same figure being obtained whether the condenser had been charged or short-circuited for a long time.

This, however, is not the case, and therefore a definite routine is necessary, not only when testing condensers, but for all insulation tests by the loss of charge method.

The routine given above, viz.—20 seconds' electrification followed by one minute insulation—is fairly widely used, and has been adopted because it yields an average result of the same order as would be obtained by the direct deflection at the end of the first minute of electrification.

Stockport T.C. has submitted to the Commissioners, for approval, an estimate of expenditure for the extension of the Millgate power station. The estimate provides for a 20 000kW turbo-alternator, four 50 000 lb. boilers, buildings, etc., the total cost being £260 000.

Work in connection with the Crewkerne electricity supply is to be commenced shortly. The application of the South Somerset and District Electricity Co. for the necessary Special Order has been granted by the Electricity Commissioners and confirmed by the Ministry of Transport and now awaits approval by Parliament.

SOUTH AFRICAN RAILWAY ELECTRIFICATION.

Why the Financial Results are Unsatisfactory.

SOUTH Africa's experience with electrification of railways has been distinctly disappointing. In the Cape Town suburban area the short Cape Town–Sea Point line, which was part of the electrified system, was worked at an increasing annual loss, reaching £47 000 in 1928, and has now been closed and dismantled.

Results on the longer Simonstown line have been far from satisfactory from the financial point of view. The electric trains, although giving a fast, frequent and efficient service, have been unable to attract sufficient passenger traffic to cover the interest charges on electrification. The loss on the line during eight months of steam operation immediately preceding electrification was at the rate of £96 000 per annum. For the eight months following electrification the loss was at the rate of £215 000 per annum, and allowing for the off-season in the next four months, the annual loss is not likely to be less than £250 000.

When plans for electrifying the line were considered by consulting engineers, they estimated the increased cost of working by electricity at £52 220 per annum, but they anticipated an increase of 25 per cent. in the passenger traffic, giving increased revenue of £139 500 per annum. Actually, the increase has been only 3 per cent., giving only £12 000 additional revenue. In fairness to the consulting engineers it must be mentioned that intense bus competition has come into existence since their estimates were made, and it is this competition which is largely responsible for the unfavourable results obtained. But the increased running costs, under electrification, have proved to be much higher than the estimate—£95 000 instead of £52 220—and the actual cost of current supplied by the Salt River power station of the Electricity Supply Commission is £20 000 per annum greater than the total steam-running cost. The fact is that Cape Town and its suburbs have not a large enough population to support an electric suburban railway system in addition to trams and buses. The rapid growth which followed the end of the war induced an excess of optimism that betrayed both the consulting engineers and the railway administration.

It was a similar excess of enthusiasm as to traffic possibilities in the immediate future combined with a very serious underestimate (running into seven figures) of the cost of electrification which has upset calculations in regard to the Natal main line electrification from Pietermaritzburg to Glencoe Junction. The coal export traffic through Durban has failed to expand owing to the intense competition in the world's coal trade. Consequently it will be some years before the electrified line in Natal can become a financial success. The line is exceptionally difficult, the up and down tracks frequently being on quite different alignments at considerable distances from one another, and this naturally increased the cost of overhead equipment. Electrical working has proved far superior to steam on the long and severe gradients of which this line is almost entirely composed, but the financial aspect has given the railway administration so much anxiety that the extension of electrification from Pietermaritzburg to Durban is not likely to be considered for some time to come, failing a quite unexpectedly rapid increase in traffic between Durban and the interior. It is not that electrification has failed to do anything that was expected of it in the operating sphere ; miscalculation of the cost of conversion and an over-sanguine expectation of the growth of traffic are the causes of the lack of financial success.

G. H. L.

Glasgow Corporation has declined to agree to the claim of the Clyde Valley Electrical Power Co. for an extension of the agreement for the distribution of electricity by the company within the area of supply authorised by the Shettleston and Tollcross Lighting Order, 1906, so far as the said area is included in the city by the Glasgow Boundaries Acts, 1912 and 1925. The Electricity Committee does not see its way to accept any of the arbitrators suggested by the company, and has agreed that the Board of Trade be asked to appoint an arbitrator.—The Electricity Committee has decided to offer to supply all electricity required by the tramways department in addition to the electricity generated by the tramways department's existing plant at 0·3d. per kWh.—The Electricity Committee has adopted a scheme for the extension of distributing mains at a cost of £54 000.

ELECTRICAL WATER HEATING.

Domestic Hot Water Supply—Importance of Correct Estimation of Quantity Required—Possibilities of Conversion—Advantages of Thermostatic Control—Types of Installations—Cost not the Sole Consideration.

BEFORE the ordinary business of the Electrical Development Association conference held at the Royal Society of Arts on January 17th was proceeded with, the meeting stood in silence for a short time as a tribute of respect and affection for the late Dr. S. Z. de Ferranti, who was president of the E.D.A.

Unfortunately Sir Hugo Hirst had not recovered sufficiently from his long illness to be able to preside, and Lieut.-Col. W. A. Vignoles (Director and Secretary of the E.D.A.) took the chair.

Choice of System.

Mr. C. Hubert Smith, who presented a paper on domestic hot water supply, stressed the point that there is now available some form of electric water heating system to meet almost any set of conditions that arises, the problem being merely that of understanding the conditions and choosing the best system for the job. The first necessity was to study the arrangements for supplying the proposed electric water heater with cold water. Assuming water to be available from a ball valve cistern and hot water to be required at one point only, a thermostatically controlled displacement type heater with bottom feed would meet requirements, the control being on the cold water inlet, the hot water passing out through an always open spout to the receptacle. If hot water was required at more than one point, the same type of heater could be used, it being provided with a union for the reception of the hot water pipe connection to the several points, and a union at the bottom for the cold water feed from the cistern. An expansion pipe must be run from the union at the top of the tank to a point above the ball valve cistern; there should be no attempt to depart from the hydrostatically balanced arrangement thus produced.

On the other hand, if no cold water cistern was available and hot water was required at one point only, the requirements could be met by a tank with broken feed arrangement, the control being on the inlet, and the outlet spout being always open. If hot water was required at several points it was best to use a cistern type of tank, which constituted a complete hot water system in itself, the main cold water feed being taken to the ball valve fitting.

After pointing to the importance of estimating the quantity of water likely to be required in any particular house as nearly as possible before deciding on the installation, Mr. Smith said that the standing cost incurred in keeping a tank of hot water ready for instant use day and night was on the average one unit per 24 hours. For hot baths, 24 gallons at, say, 105 deg., there would be required 12 gallons from tank at 160 deg., mixed with 12 gallons cold, the units required for each bath being about 4. For wash basins, using a gallon of water at 160 deg. and a gallon cold, about one-third of a unit would be consumed per wash. For washing up and scouring, at 160 deg., 3 gallons per unit. The units consumed per week by a household requiring an average of one bath, six handbasin washes and 15 gallons of water for general domestic use daily, plus standing loss, would be 84 units. At ½d. per unit this would cost 3s. 6d. per week, or at ¾d., 5s. 3d. per week.

The conversion of existing hot water systems by fitting immersion heaters in storage tanks, could be done successfully in some cases, and it was easy to draw the line between success and failure. He emphasised the importance of tracing out all the hot water pipe connections. If hot water pipes disappeared to unknown destinations or straggled about over a house in long runs; if there were secondary circulating systems, possibly supplying hot water radiators in linen cupboards, or towel rails; or if the expansion pipe was taken up outside a high building; one should not attempt to convert by immersion heaters in the tank. If the system was small and compact, and promised well for conversion, a 2 kW immersion heater should be fitted in the storage tank. The heater was best controlled thermostatically but could be controlled alternatively by a series parallel switch. Large capacity heaters with hand control should not be fitted. The heater could, if desired, be considered as an auxiliary to a slow combustion stove situated in the kitchen, the heater being used in the summer months and at night during the winter, a thermostat automatically cutting it off when the stove is in use. Under such conditions the load would be particularly acceptable to the supply engineer.

Another method was to insert a complete stat-controlled heater in the pipe runs, though it was difficult to see the justification for the cost of this heater when equally good results could be obtained in a small installation where the pipe runs were short by inserting an immersion heater in the storage tank.

The immersion heater would only heat water effectively above its own level, so that if the storage tank was only large enough to meet requirements the heater should be placed as near the bottom as possible. If the tank was unnecessarily large, the heater could be placed higher up, according to the proportion of the tank capacity that was considered necessary to meet the household needs. Hot water would not circulate below the level of the immersion heater, so that fear of wastage through hot water circulating down through the boiler need not be entertained. The hot water pipes should all lead away from the top of the storage tank. The storage tank, when electrically fitted, should be heat insulated. Where immersion heaters were to be hand controlled, it was advisable to fit a pilot lamp in a conspicuous position which would indicate when the current is on.

The fitting of an immersion heater in an existing hot water storage tank as an auxiliary to the coke furnace could be usefully extended to much larger premises. For instance, in a block of office buildings or flats centrally heated by a coke boiler and hot water radiators, where there was no resident caretaker, where the temperature of the water was not maintained and the building was cold in the mornings because the furnaces are not properly kept going during the night, the difficulty could be overcome by fitting an electric circulator in parallel with the furnace, the heater being controlled by a thermostat in the domestic hot water storage cylinder or in the return pipe of the hot water heating system. Such an arrangement was particularly suited to night load. A time switch of small current-carrying capacity was inserted in the thermostat-operating coil circuit of the main contactor. This was a sound idea and could be made profitable to all concerned.

Another system was to fit a complete stat-controlled water heater in conjunction with a solid fuel boiler. In this case the water heater took the place of the usual storage cylinder, and was piped in the same way, with expansion, draw off and primary flow and return from the boiler.

Large blocks of flats were being supplied with hot water electrically heated. The cost of current was, of course, higher than would be the actual cost of coke used if the water were supplied from a coke-fired boiler, but the mere cost of coke in a coke-fired system was only a fraction of the total overall cost. There had to be considered the space occupied by the boiler house, the chimney, the distribution piping, the possible annoyance to tenants by smoke and dust, the labour involved in stoking, the entire dependence upon the efficiency of the person responsible for stoking, the storing of coke and many other incidental points. As against this, the electrically heated system was very flexible, it would meet demands more promptly, and the personal factor was eliminated entirely. A separate system could be provided for each block and the storage tanks placed either in the basement or the roof, whichever was the more convenient. Where a constant hot water supply is included in the rental, a group system could be employed where one storage tank supplied a group of, say, 12 to 15 flats, all adjacent. The working temperature of these group systems was of importance, and the thermostat should be set so that the temperature never rose above 170 deg. F.

Installations in Flats.

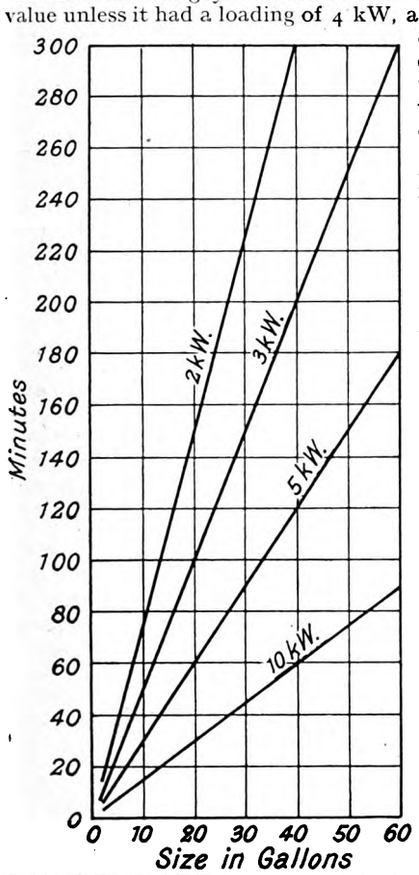
The fitting of separate tanks in each flat had been found by experience to be the best system to adopt, each flat being entirely self-contained as regards its hot water system, the current being registered through the tenant's own meter, and the risk of careful tenants suffering inconvenience and extra cost due to the wasteful extravagances of others avoided. Mr. Smith instanced five typical flats equipped with lighting, heating, cooking and water heating. The landlord paid the primary kW. charge, which was included in the rent. One meter was fitted in each flat registering all units consumed

Digitized by Google

for which the tenant paid at the rate of ½d. per unit. The hot water tanks were considered as fixtures and part of the flat equipment, the landlord meeting the cost. The tenants hired the cookers, fires, and similar appliances. The average consumption per flat per week (one summer and one winter quarter) was 200 units, costing 8s. 4d. In five similar flats equipped with lighting, heating and water heating (no electric cookers) the average per week was 98 units, and the cost 4s. 1d.

A modification of this system was to arrange for the hot water installation in each flat to be completely independent, by fitting a cistern type water heater in each flat, supplied direct from the cold water main. A very large number of tanks of this type had been installed with satisfactory results.

Electric geysers or instantaneous water heaters had a certain field of usefulness, but could be almost left out of consideration as a means of meeting the general demand for hot water. An instantaneous geyser could be considered as of no practical value unless it had a loading of 4 kW, and it was then useful only for wash basins, dentists, and so forth, where small quantities of water were required intermittently. For washing up purposes it was necessary to have a loading of at least 6 or 8 kW, and for bath purposes a loading of nearer 16 kW, to give any real practical results. Such loadings were not welcome to the supply authority, and the cost of wiring was high.



Size of heater required to heat a given amount of water in a given time. (From "Electric Light and Power," January 1930.)

Other installations described included a 200-gallon night storage water heater designed to supply hot water to 12 wash-basins. The heaters were controlled by a time switch which allowed the current to be on between the hours of 11 p.m. and 7 a.m., and during these hours only the cold water was free to enter the tank. The draw-off for hot water was from the bottom of the tank, so that the fullest value of the hot water storage could be obtained during the day. Another installation was a 1 000-gallon tank for supplying a group of slipper baths. The water supply in this case was continuous, but a restricting valve was inserted by which the flow of water could be reduced to 45 gallons per hour, which was a little above the heating rate of the 18 kW loading provided.

Though, generally speaking, it was better to put immersion heaters direct into the storage tanks, this was sometimes inconvenient, and circulators were provided to meet exceptional cases.

Discussion.

Mr. Steele said that from the figures given in the paper, we could not hope to get electric water heating installed in our own and other people's houses until we could get current for the purpose at somewhere about ½d. per unit.

Mr. C. G. Nobbs urged that more definite information for general use should be collected with regard to the consumption of electricity and hot water for general domestic purposes. Such information might be collected by supply managers, and possibly the E.D.A.'s new sub-committee dealing with hot water would obtain figures from all over the country and might be able to arrive at a slogan or formula in relation to hot water, as with electric cooking. Owing to the large variation in the consumption of hot water by various families, one must be careful in answering questions as to cost per week. It was safer to say that 50 gallons could be heated for 12 units. For small domestic hot-water single-pipe systems the daily consumption would probably average 2 units per person, though in individual cases the consumption would probably be much greater. A water temperature exceeding 150 deg. F. was totally unnecessary for household purposes. Leaky taps were a great source of waste, and might be responsible for a waste of from 30 to 50 gallons per day. Local storage, push system or displacement water heaters should have anti-drip syphon or other arrangements to prevent loss of water by expansion during heating up. Installations having live circulation mains from the storage boiler would consume quite an appreciable quantity of electricity in maintaining a temperature in the circulation pipes night and day. A stop valve in the return pipe, when shut down, prevented a live circulation of hot water and the consequent heat loss. Where it was essential to have a live circulation, a return stop valve would effect a big saving if shut down during the night. For most office buildings there was no need to provide a live circulation for the lavatory basins. He urged electricity suppliers to give consumers hot water *ad lib.* and cheaply, without petty peak eliminators or restrictions; they would thereby secure a lucrative business.

Load Factor Variations.

Mr. F. Selley said that statistics relating to London and Greater London showed a load factor varying from 19 to 33. There was no apparatus other than water-heating apparatus on the market which was so beneficial from the load factor point of view, and the load factor could be improved without making additions to generation stations or mains. In regard to cost, if one supply authority could supply cheap units for off-peak load, there was no reason why others could not do the same. The number of units supplied in London and Greater London last year was in the neighbourhood of 1 500 000 000, but by providing sufficient storage and efficient lagging it was possible to double that figure in the near future. If the number of units supplied had been doubled and the load factor increased to 50 per cent., and the profit were 0·1d., the supply authorities in London and Greater London last year would have made a profit of about £600 000. His records, obtained by means of recording ammeters, had shown that if consumers were given supplies for water heating *ad lib.* the load was a non-peak load, and, by governing with time switches, he had found that there were 8 or 9 hours per day to spare for building up the load. It was time the supply authorities got together and made up their minds what was the lowest rate they could accept for off-peak loads.

Mr. Leadbetter (Hampstead) said that he was supplying more water heaters than cookers, and the users were delighted. Cost was not the top and bottom of everything; convenience was very important, and many people did not mind if their hot water cost them an extra 1s. or 2s. per week provided they had the convenience and the reliability of electric water heating.

Mr. Honey (Croydon) said that in Croydon between 1 300 and 1 400 water heaters had been sold since 1925. He was glad to note that supply authorities were beginning to reduce their prices towards the figure of ½d. per unit; the rate in Croydon was 0·75d., on the two-part tariff. Figures obtained in Croydon showed that for an average small house with an 11-gallon heater the consumption was about 5 units *per diem.* Night heating had been tried in Croydon, but the trouble was to provide sufficient storage capacity. It was often difficult to find room for large tanks.

The Chairman, referring to his own installation, consisting of an immersion heater fixed in the tank in the linen cupboard, said the daily consumption in summer, when electricity only was used, was about 12 units, but if the tank were lagged efficiently the consumption would be less. People were prepared to buy things on a basis other than that of low cost, and that was where salesmanship came in. The comfort resulting from the use of an electric water heater was enormous.

Mr. Smith, replying to the discussion, said that at 1d. per unit there was some hope, at ¾d. there was a lot of hope, and at ½d. it was easy. The restriction of water flow in all the cases he had mentioned was on the cold water side, so that the problem of furring did not arise. To provide any restriction on the hot water side was to ask for trouble. When considering costs it was best not to compare the costs of electric water heating with the costs of water heating by coal, coke or gas, but rather to consider whether it was not worth the money to have a perfectly reliable supply of hot water at any time of the day or night, without the trouble of stoking a fire, sweeping up the mess after stoking, and so on.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Our Debt to Ferranti.

[To the Editor.]

Sir,—May I, as the "old man" of the electrical engineering world, be allowed to express how much we owe to Ferranti, whose sudden death last week has saddened us all. I believe that I express the unanimous opinion of electrical men, certainly of this country and probably abroad, that we owe the great progress made during the last 40 years in generating and distributing electrical energy, which is now the most important and best controlled force of nature, to Ferranti, far more than to any other man. For Ferranti, when quite a young man, when working out his Deptford scheme in the 'eighties, encountered and successfully dealt with, in turn, the whole of the difficult problems of generating and distributing electrical energy by alternating currents, which are now so familiar to us all.

It is true that those—I amongst them—who started to deal with the far simpler problem of generating and distributing, at that time chiefly for lighting purposes, by direct-current and accumulators, had made more substantial progress than Ferranti at the time that he was working at Deptford, and that at that time the merits of the two systems seemed to be in the balance, as those who remember the exciting debates which took place at the Institution of Electrical Engineers will testify. But Ferranti soon caught us up, and I was one of the first to acknowledge that Ferranti had beaten us and had given us the extra-urban generating stations in place of the small inter-urban stations with which we had commenced during the early days.

Ferranti, the quietest, most unassuming of men, can now be judged at his real worth, and I, as an Englishman, am proud of him and am deeply saddened by his death.—I am, etc.,

R. E. Crompton.

Kensington Court, W.
January 21st.

Dr. Ferranti's Safety Switchgear.

[To the Editor.]

Sir,—May I be permitted to supplement your excellent memoir on the late Dr. de Ferranti by referring to one branch of his work which saved the lives of many hundreds of central station operators in the early days of h.t. electricity supply in this country.

It was my privilege to serve under him as a draughtsman at the Hollinwood works, 1898–1901, when he was developing his cellular h.t. switchgear which eliminated all exposed busbars, cable connectors and inter-connections by the simple process of mounting these unit parts on the face of the central station wall and protecting them by enamelled slate partitions.

This system ultimately gave birth to the metal-clad switchgear which has become standardised in all British central stations and which is steadily making its way into the power houses of other countries, not excluding the United States of America.

This portion of Dr. de Ferranti's work is apt to be overlooked because his later manufacturing interests were concentrated upon transformers, meters, instruments and during the past three years, upon the fascinating problems of radio reception, but I am confident that central station men who now enjoy complete immunity from danger in the handling of e.h.t. alternating currents would wish that testimony should be given to the famous electrical engineer for his pioneer work in this field.

Some thirty years ago I had painful experience of a type of switchgear (save the term) by which I was blinded due to heavy arcing from inefficient switches and several of my colleagues had narrow escapes from death by electric shock, but happily this apparatus was replaced by the Ferranti safety cellular method.—I am, etc.,

W. E. Warrilow.

Oxhey,
January 17th.

Modernistic Typography,

[To the Editor.]

Sir,—Referring to Mr. J. Arthur Dunville's point of view regarding Modernistic Typography in your issue of January 10th and his statement as to attempts at modernistic treatment ending in the grotesque, I certainly differ in opinion. The modernistic typography is rapidly advancing, and can without doubt convey its message with as much interest as any drawn lettering and even illustrations, therefore, I agree with Mr. J. S. Simmons's view.

I have seen many instances where typography has resembled drawn lettering. To-day, with the great number of faces at our disposal, combined with a perfect sense of balance in layout, plenty of white space, good choice of types and, above all, beautiful modernistic arrangement, I have seen many instances of this modernism which make drawn lettering, shall we say, "feel small."—I am, etc.,

H. Williams.

Streatham,
January 20th.

"EFFICIENCY."

Interesting Discussion at Informal I.E.E. Meeting —Views on Mass Production.

At the informal meeting of the Institution of Electrical Engineers on January 13th, Mr. C. F. Mounsdon was in the chair when Mr. Albert Morgan opened a discussion on "Efficiency." He said efficiency might have a sub-title, "Something for nothing, or success is easier than failure," but he definitely repudiated all idea of associating efficiency with mass production. Mr. Morgan in so many words defined efficiency as matter in the right place, and he displayed an ingenious and formidable time-sheet designed first of all for putting matter in the right place by ensuring that the workman was on his job at the psychological moment; and he had a number of diagrams and graphs showing the accumulative effects of lost efficiency in the early stages of production, either by delay in handling a problem, awkwardness due to unfamiliarity, unsuitable tools, etc. Mr. Morgan exhibited a workman's tool outfit, worn as a belt, and designed to cope with all reasonable emergencies. It embodied in addition to the usual knife, pliers and screwdriver, a spanner, torch, voltage tester, and range of adaptable carbon brushes, etc.

Mr. S. W. Melsom said mass production was one form of efficiency only—how could one measure the efficiency of say, Oliver Heaviside, who worked comparatively few hours per year, but in that short period produced results of the utmost value worth more than very much mass production.

Messrs. J. R. Bedford, J. H. C. Brooking, R. Grigg, S. B. Jackson, J. H. H. Lloyd, C. F. Mounsdon, N. Prentice and E. Kilburn Scott also spoke.

HOME ELECTRIFICATION.

Special Course of Lectures for Women.

A PRACTICAL course of lectures on home electrification for women in electrical showrooms, women architects and decorators has been arranged by the E.D.A. in conjunction with the E.L.M.A. and the Electrical Association for Women, and will be held at the E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, W.C.2, on February 12th–15th. The lectures will include all aspects of the domestic applications of electricity, special attention being paid to suitable instruction on salesmanship. The course, which is the first of its kind, is open to all women who are interested in the subject. There are no fees, but application for reservation of seats should be made either by the reply postcard which is being circulated or by letter.

NEWS IN BRIEF.

Theatrical Propaganda for Electrical Development—Electric Boats for Children—The Buenos Ayres Exhibition—Sweden's Electrical Exports.

THE Whitworth Society made a donation of £25 to the College of Technology, Manchester, last July, to provide prizes for the encouragement of promising students preparing for the Whitworth Scholarship examinations. The first awards have now been made to Mr. F. F. Butterworth, 54, John Street, Rochdale, and Mr. F. C. Thornley, "Arnside," Stockport Road, Hyde. The society hopes to make similar donations to other colleges as funds may permit.

Electrically heated water is now available in sleeping cars on the London and North Eastern Railway East Coast night expresses.

Ashton-under-Lyne Electricity Committee is seeking a suitable site for new administrative buildings with facilities for displaying electrical apparatus.

Sunderland tramway employees, who threaten to strike as a protest against a new duty sheet, have accepted the report of the deputation elected to confer with the Tramways Committee.

Bombay Corporation is of opinion that the Government should take steps to prevent the proposed transfer of the agency of the Tata Hydro-Electric Power Supply Co. to an American syndicate.

The first of the police telephone boxes in North London was opened at Wood Green on Monday. It is understood that the Scotland Yard authorities are satisfied with the results of the boxes at Richmond.

Bombay Corporation has approved the Municipal Commissioner's proposal for installing electrically controlled and illuminated clocks on the poles of the Bombay Electric Supply and Tramways Co., Ltd. At present only two such clocks are to be installed.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of January 24th, 1880, recorded that the Post Office authorities had at length adopted the telephone—"the combination of Crossley's transmitter with Bell's receiver having overcome their objections to its use."*

It was proposed to use submarine electric lamps in the operations connected with the raising of the submerged girders of the Tay Bridge.

The possibility of utilising the tides to generate electricity was the subject of a leading article.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of January 27th, 1905, a trial trip on the electrified District Railway, between Mill Hill Park and Whitechapel, was recorded.*

Reference was made to a Diesel-electric boat recently placed in service on the Lake of Geneva.

A deputation from the Commons and Footpaths Preservation Society had just waited upon the Postmaster-General to urge that steps be taken "to prevent the disfigurement of commons and places of natural beauty by the erection of lines of unsightly telegraph posts and wires."

* * *

FIFTEEN years ago, THE ELECTRICIAN *of January 22nd, 1915, stated that so many engineers had volunteered for national service that the War Office could not consider further applications.*

* * *

TEN years ago, in its issue of January 23rd, 1920, THE ELECTRICIAN *gave details of the Electricity (Supply) Act of 1919, and expressed the view that it opened "a new and we believe a prosperous period for the supply industry in this country."*

Exhibits for the British Industrial Exhibition in Argentina, which opens at Buenos Ayres on February 18th will be admitted duty free and carried by the authorities to the show grounds.

Eastbourne Watch Committee has inspected automatic signals erected by the Siemen's and General Electric Railway Signal Co., Ltd., Messrs. Barber and Coleman, and the Forest City Co., Ltd. The Chief Constable is to make inquiries at various towns in which either of the types submitted is in operation. Meantime, consideration of the matter is deferred.

Northampton Parks Committee has decided to adopt electric lighting in the Miller's Meadow playground.

South Shields Health Committee has asked the Medical Officer to consult with the Borough Electrical Engineer on the question of heating the discharge block and laundry of the hospital.

London County Council Parks Committee recommends the Council to grant a licence to Messrs. T. and T. Maxwell to hire out electrically driven boats for children on some of the shallow lakes in parks.

The West Wilts Electric Light and Power Co. has equipped the mills of the Trowbridge Tyre and Rubber Co. with electrical plant, including two motors of 250 and 150 H.P. respectively. The supply is taken from Bath Corporation's mains.

Exports of electrical machinery from Sweden in the ten months from January to October, 1929, were valued at 26 654 kr. (against 36 692 kr. in the corresponding months of 1928) and exports of telephone and telegraph apparatus during the same period were valued at 11 222 kr. (compared with 11 144 kr.).

The Bell Telephone Co. of Canada proposes during the next five years to instal a quarter of a million telephones in the provinces of Ontario and Quebec, and to spend in those States about £3 200 000 on extension and replacement of plant. The company's investment in plant has increased more than 105%, and is now about £29 000 000. The number of telephone stations has risen by 61·4%. The number of British telephone stations in four years ended January, 1929, increased from 1 251 852 to 1 730 782, or 31%.

Mr. E. Kilburn Scott sends us particulars of a concert arranged by him and held at the Claremont Central Mission, Pentonville, London, N., recently. Amongst the performers was Mr. H. G. Harrison, who, Mr. Kilburn Scott informs us, produces beautiful music on the æola, a modern development of the original concertina. Mr. Kilburn Scott remarks that this concert was, in a sense, a commemoration of the invention of the English concertina by Sir Charles Wheatstone (the inventor of the Wheatstone bridge) about a century ago.

The Electrical Association for Women's play, "Watts in a Home," produced by J. Shannon, will be given at Rudolf Steiner Hall, 33, Park Road, London, N.W.1 (near Baker Street Station), on February 11th at 8 p.m. The play deals mainly with the development of electricity, chiefly in connection with lighting, from 1880 up to the present day. Mr. T. C. Sterndale Bennett will contribute "Songs and Nonsense" to the evening's entertainment. Tickets (ranging in price from 10s. 6d. to 2s. 4d.) from the Box Office at the Hall or from the E.A.W. headquarters.

Sir Andrew Duncan, chairman of the Central Electricity Board, will be one of the speakers at the annual luncheon of the Glasgow and district branch of the Electrical Association for Women, in the Grosvenor Restaurant on January 27th.

Belfast Corporation is advertising for tenders for the building of 50 tramcars. At a recent meeting of Belfast Trades Council, it was stated that better and cheaper tramcars could be built in Belfast than in cross-Channel factories, and that the sending of £100 000 out of the city in the present state of trade would be a huge mistake. The tramway depot works, it was stated, could be sufficiently enlarged to do the work.

Imports into the Irish Free State in November, 1929, included electrical goods valued at £55 933, compared with £73 244 in November, 1928. The value of electrical goods imported from January to November, 1929, inclusive, was £568 855, against £483 247 in the corresponding months of 1928. Re-exports from the I.F.S. in November last included machinery and electrical goods to the value of £32 391, against £10 059, and the same classes of re-exports from January to November, 1929, amounted to £251 288, against £102 019.

In an article by Mr. G. T. Edwards on "Sugar Beet," in the S.W.S. (Shropshire, Worcestershire and Staffordshire Electric Power Co.) House Magazine, it is mentioned that the West Midland Sugar Beet Factory, situated between Kidderminster and Stourport, takes current from the power company's lines, and that, with the continued increase in production per acre and the possibilities that rural electrification holds out for cultivation and tilling, it may become one of the firmly established industries in the company's area.

THE SOCIAL SIDE

MEMBERS of the editorial and advertisement staffs of THE ELECTRICIAN were the guests of Mr. R. D. Savage at a theatre and cabaret on January 10th when the occasion was

Mrs. Leslie Gamage (extreme left), daughter of Sir Hugo Hirst, with some of the 100 junior employees of the General Electric Co., Ltd., whom she entertained at the Olympia Circus, London.

thought a fitting opportunity to present to Mr. Bernard C. Holding an inscribed cigarette case as a mark of esteem and a souvenir of his association with the paper as Editor.

At a dinner given to the editorial and advertisement staffs of "The Chemical Age" last week, at the Rendezvous Restaurant, the toast of "Benn Brothers' Jubilee Year" was proposed by Mr. L. J. Moolenaar, who referred to the firm's great past and still greater future, and acknowledged by Mr. F. E. Hamer. During the evening Mr. B. Fullman, who has accepted an appointment on the Non-Ferrous Metal Research Association, was presented with a handsome silver Waterman fountain pen, in case, bearing the inscription "B. Fullman, B.Sc., A.I.C., from his colleagues on the C.A., January, 1930."

The seventh annual G.E.C. Junior Social was held on January 3rd, in the Lecture Hall, Magnet House, when nearly 200 members of the Junior staff were entertained by the committee of the Social and Athletic Club and the directors of the G.E.C. Dancing and singing, interspersed with games and refreshments, provided a most enjoyable programme, which was thoroughly appreciated by all. The dancing competition for prizes presented by Mrs. L. C. Gamage was keenly contested, and the lucky winners had to exercise all their prowess to achieve success in what in any other sporting circle would have been called a close fight. The evening owed much of its success to the hard work of Mr. E. A. Joyce.

The directors of the Stearn Electric Co., Ltd., entertained their sales force to a dinner at the Holborn Restaurant on January 10th. Among those present were Sir Maxwell Hicks, chairman; Mr. Bottome, managing director; Mr. Edgecombe, technical director; Mr. Oldman, sales manager; and Mr. Pollock, sales organiser (Messrs. Maxwell Hicks and Co.). Sir Maxwell Hicks, in the course of his address, expressed the view that in his opinion the commercial problem of this country did not lie in production, but in selling. He reminded the company present that it was their duty to carry on the life-work of the founder of the firm—Mr. Charles H. Stearn—who, along with the late Sir Joseph Swan, was responsible for presenting to the world the gift of modern electric light.

The month of January has many inseparable associations, and one that is eagerly looked forward to by the members of the staff of Ferguson, Pailin, Ltd., Manchester, is the annual party given by the company, this year held on January 11th, in the company's dining rooms. The success of such an event depends in no small measure on a good beginning and an excellent tea was served to the 350 guests. After tea a talented troupe gave an exhibition of acrobatic and character dancing. The guests spent the remainder of the evening in dancing, with the exception of an interlude, during which Mr. George Pailin produced one of his inimitable farces—a pantomime based on the story of "Dick Whittington"—which provoked an abundance of merriment among both players and guests. The function terminated at 11.30 p.m. and as on previous occasions Mr. Samuel Ferguson and Mr. George Pailin presided.

PERSONAL.

MR. C. E. D. Greenhalgh has been appointed electrical engineer to Ilkley U.D.C.

Lord Gainford, vice-chairman of the B.B.C., celebrated his 70th birthday on January 17th.

Mr. R. F. Dixon, late manager of the Mansfield Tramway Co., has been presented with a gold repeating watch by the members of the Tramwaymen's Social Club, of which he was the founder nine years ago and President.

In connection with the notice which appeared on page 42 of our January 10th issue concerning the late Mr. J. W. Willmot, we are asked to point out that the surname should have appeared as above and not as formally printed.

Mr. Lorcan William Kennan, a student of Dublin, apprenticed to Mr. A. G. Bruty, has obtained the silver medal offered by the City and Guilds of London Institute, the gold medal and £20 money prize of the Electrical Contractors' Association, and a scholarship value £25 from the City of Dublin Technical Schools.

Epsom Electricity Committee has received a request from the electrical engineer, Mr. H. W. Watts, that he be paid in accordance with the scale laid down by the Associated Municipal Electrical Engineers. The salary which would be payable in accordance with such scale would now be £760, but the Committee is not prepared to recommend the Council to adopt the scale referred to. Members of the Committee, nevertheless, feel that the exceptional development of the electricity undertaking which has taken place since Mr. Watts was appointed in 1925 should be recognised by an addition to his salary, and recommend that from April 1st next it be increased from £600 to £700 per annum.

In addition to his portrait in oils presented by the staff of his department, Mr. R. A. Chattock, who has retired from the position of city electrical engineer to Birmingham Corporation, has been the recipient of further gifts. The chief officials of all departments of the Corporation have given him a handsome service of Georgian glassware. Mr. Jennings presided at a luncheon and made the presentation on behalf of the City's officials. The members of the Electric Supply Committee have also entertained Mr. Chattock at dinner Councillor Beale presiding, and presenting him with a silver fruit dish, subscribed for by the members of the Committee, together with an illuminated minute of appreciation of Mr. Chattock's services during the past 26 years.

The funeral of Dr. S. Z. de Ferranti took place on January 17th, at the Hampstead Cemetery. Father Reardon officiated. The chief mourners were Mrs. S. Z. de Ferranti (widow), Mr. and Mrs. Vincent Z. de Ferranti, Mr. Denis Z. de Ferranti, Mr. and Mrs. Pyecroft, Dr. and Mrs. Orde, Miss Yvonne de Ferranti, Mr. Castelnau, Mr. M. Z. de Ferranti, and Mr. T. O. Ince. Others present included:—Sir Andrew Duncan and Mr. Archibald Page (Central Electricity Board), Mr. T. Wilmshurst (Electricity Commissioners), Mr. Ll. B. Atkinson (Royal Society of Arts), Dr. F. E. Smith (Royal Society), Colonel R. E. Crompton, Colonel Sir T. F. Purves and Mr. P. F. Rowell, Mr. D. N. Dunlop, Lieutenant-Colonel W. A. Vignoles, Mr. Hirst, Mr. A. C. Cramb, Mr. Nicholls Moore, Mrs. Hammer and Miss Haslett (Electrical Association for Women), Mr. Pendred, Mr. H. W. Kolle, Mr. Seetham, Mr. R. H. Fox, Mr. T. E. Bakker (The Hague), Mr. J. Christie, Mr. Addenbrook, Mr. F. Bailey, Mr. G. W. Partridge, Major Thomas, Major R. W. Cooper, Mr. A. M. Sillar, Mr. and Mrs. A. E. Hadley, Admiral Sir Edward Charlton, Mr. Mordey, Colonel Behrand, Mr. and Mrs. H. C. Lamb, Mr. R. A. Hopkinson, Professor W. C. Clinton, Captain J. H. Donaldson, Mr. V. Watlington, Mr. C. Rodgers, Mr. R. P. Wilson, Mr. Sanderford, Mr. and Mrs. Merz, Mr. J. R. Beard, Mr. C. P. Sparks, Captain A. C. Sparks, Mr. G. H. Lepper (THE ELECTRICIAN), Mr. W. E. Warrilow, Mr. L. S. Morshead, Mr. Schofield, Mr. A. Hall, Mr. Davies, Mr. Bass, Mr. Tyldesly, and representatives of the workpeople. A memorial service for Dr. de Ferranti was held at Manchester at the same hour, and was attended by 1 500 people from the Ferranti works at Hollinwood, Lancs.

Obituary.

MR. BERNARD SANKEY, at Johannesburg, South Africa on January 12th. He was from 1906 to 1912 borough electrical engineer at Whitehaven and left that town to accept an appointment in South Africa. He subsequently became general manager of the Johannesburg Electricity Department, and rose to become President of the South African Institute of Electrical Engineers.

THE COAL BILL.

Objections Raised by Industrial Associations—Views of the F.B.I.

IN view of the close association of the electrical industry with coal the following views on the Coal Mines Bill are of interest :—

On December 12th, 1929, the Federation of British Industries addressed to the Prime Minister a request for delay in taking the Second Reading of the Coal Mines Bill in the House of Commons on the ground that consumers of coal had had no opportunity of considering a measure vitally affecting their interests, or of communicating any views thereon to the House of Commons or to the Government. This appeal was not effective, and the Second Reading of the Bill was obtained a few days later by a small majority of the House of Commons. The F.B.I. has now had an opportunity of consulting industry in regard to the Bill. Meetings have been held in all the leading industrial districts, and in addition a strong Central Committee representing all the main industries has reviewed the proposals. As a result of this consideration the F.B.I. is in a position to state that the Bill is not only wholly unacceptable to industry, but arouses the gravest apprehensions as to its effect, if ever put into operation, upon the industrial well-being of the country. As the Federation does not concern itself with wages, hours or conditions, the criticisms which it has received do not relate to Part II of the Bill and it does not desire to express opinion thereon.

The Council of the British Engineers' Association has unanimously passed the following resolution :—" The Council of the British Engineers' Association objects to the basis of the Coal Mines Bill, now under consideration, being convinced that Government intervention in the conduct of industry is against the general interests of industry, and in this particular case the Council is extremely apprehensive of its effects on the engineering industry, and fears a further increase of unemployment resulting from a consequential diminution of our exports of manufactured goods."

The Council, in passing this resolution, has been influenced by a sense of the economic absurdity of further shortening the working hours in an industry which admittedly is fighting for its life, and whose only hope lies either in a reduction in costs of production or a commensurate rise in the world level of coal prices. The latter is beyond the control of the coal mining industry of this country, and is unlikely to provide a means of salvation within the time with which practical coal politics need concern itself. It may be regarded as certain that the provisions of the Coal Mines Bill will increase the price of industrial coal, thereby adding to the load borne by the coal-consuming industries, many of which are already struggling under devitalising costs of production and are hard put to it to maintain something considerably less than their pre-war export trade.

Handicapping the British Manufacturer.

The Council of the London Chamber of Commerce has registered an emphatic protest against the Bill, which it considers to be unsound in principle, unpractical in its provisions and damaging in its effects on the trade and commerce of the country as a whole, as well as detrimental to the interests of the private consumer of coal. The Council is opposed, in principle, to any statutory provision for the enforced restriction of output, for the control of supplies, or for the sale of coal at minimum prices. The immediate effect of the Bill will be to raise the cost of coal to the home manufacturer, without any likelihood of a subsequent reduction in price following upon greater efficiency in the industry. On the other hand the Council considers that, with the removal of economic pressure, by the creation of a monopoly and the fixing of prices, a strong incentive towards better organisation in the industry will have been removed. A further point to which the Council desires to draw attention is the probable disastrous effect upon British industry of the marketing proposals, by which coal may be sold abroad at a price below that obtained in this country. The British manufacturer will therefore be further handicapped in order to benefit his foreign competitor and unemployment at home will in consequence be increased.

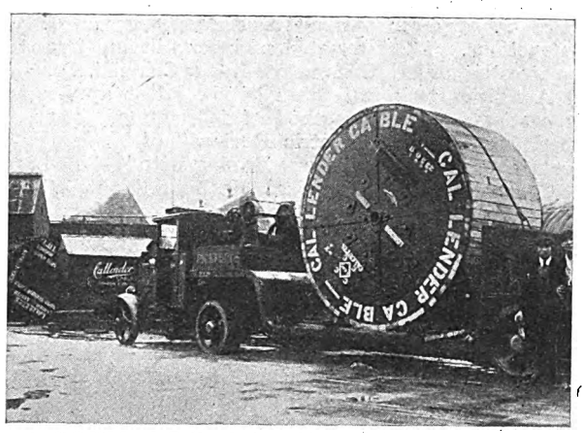
Kettering U.D.C. is applying for a Special Order for extending the area of supply of its electricity undertaking so as to comprise additional parishes in Kettering, Gretton and Oxendon rural districts.

BUSINESS ITEMS.

SUPERLAMP, LTD., announce the opening of a new branch at 11-13, Union Street, Maidstone.

Will the makers of " Sunray " 600 ft. beam torches, or their agents, please communicate with the Editor.

The makers of the " Ideal " electric iron, or their agents are requested to communicate with the Editor.



A DRUM of Callender's cable, weighing 22 tons 5 cwt., leaving the works for shipment abroad.

DAVIES AND JONES, radio and electrical engineers, of Ramsgate, have taken larger premises at 120, King Street.

MR. T. R. CALDICOTT, radio engineer, of 37, Milsom Street, Bath, has disposed of his business to BRISTOL WIRELESS, LTD.

VAC-TRIC, LTD., announce that they have removed to Waterloo Road, North Circular Road, Cricklewood, London, N.W.2.

The Bristol branch of the GENERAL ELECTRIC CO., LTD., has been removed from 81, Victoria Street, to 24, Victoria Street, Bristol. Telephone : Bristol 9550 (three lines).

An agreement has been entered into by Wild-Barfield Electric Furnaces, Ltd., and Gibbons Bros., Ltd., of Dibdale Works, Dudley, for the manufacture by the latter of large " Wild-Barfield " industrial electric furnaces.

With the prospect of a public supply of electricity to Biggar, JAMES STEPHEN AND SONS, of Main Street, are opening an electrical department. An electrical business is also to be opened at Biggar by the TWEEDDALE MOTOR CO., LTD., of Peebles.

We are informed that " Hart " batteries supplied the necessary current for driving the motors and lighting the valves of the Baird television apparatus, the demonstration of which formed such a successful feature at the recent Schoolboys Exhibition held at the Horticultural Hall, London, S.W.1.

An exhibition of electrical apparatus was held by Electrical Distribution of Yorkshire, Ltd., at the Baptist Church Schoolroom, Denholme, from January 14th to 18th. Several manufacturers had stands, and demonstrations of electric cooking etc., were given daily. The exhibition attracted a large number of visitors.

The Trade Commissioner in South Africa (Mr. N. Elmslie) has forwarded to the Department of Overseas Trade copies of the Electricity Supply Regulations for the City of Cape Town and the Municipality of Port Elizabeth. Copies of the regulations are available for loan to British firms, at the offices of the Department, 35, Old Queen Street, London, S.W.1.

We are advised that Nutter, Son and Edge, Cromford House, Cromford Court, Manchester, by arrangement have ceased to represented the FOSTER ENGINEERING CO., LTD., Morden Works, Wimbledon, London, S.W.19, in the Manchester area. Mr. F. Harrison, late of the British Thomson-Houston Co., Ltd., Sheffield, will act in the future as branch manager at 13, Albert Place, Bridge Street, Manchester.

VICKERS-ARMSTRONGS, LTD., Barrow, have secured the order for two P. and O. ships. The vessels will be propelled by turbo-electric machinery manufactured by the BRITISH THOMSON-HOUSTON CO., of Rugby, acting in collaboration with Vickers-Armstrongs, Ltd. The boilers will be of the latest high-pressure type designed by Yarrow and Co., the boilers for one ship being built by Yarrow, and for the second ship by Vickers-Armstrongs.

FABRICATED STEEL.

Rolled Steel in Electrical Machine Construction—Structural Steel Welding.

THE fabricated steel alternative to costly castings has been adopted not only in America, by the General Electric Co. and the Westinghouse Co., but on the Continent and in conservative Britain the newer development has abundantly proved itself. All the leading manufacturers of electrical machinery in this country are making ever-increasing use of welded constructions. The interested engineer will find from time to time arresting descriptions in the home, Colonial, Continental, and American technical press of the latest applications of this casting-substitute method of fabrication. Thus, in the (American) "General Electric Review" of November, 1929, there are two articles, the one dealing with "Rolled Steel in the Construction of Electrical Machines," the other with "Structural Steel Welding," each being a reprint of a paper delivered before the World Engineering Congress, held at Tokio, October 29th to November 7th, 1929. The articles are well illustrated, the former showing typical stator frames, rotor spiders, upper and lower brackets of a vertical water-wheel alternator, and a hydraulic combined brake and jack, while the examples of structural work include several many-storied buildings. It is well that interested parties should realise that there are pros and cons to consider in this matter of welded steel versus castings. While the innovation has been more than justified in the majority of cases brought prominently before the engineering public, it would be most unwise for the layman in these matters to conclude off-hand that each and every occasion calls for the change. Cases have to be adjudged upon their merits. For the best results to be secured it is necessary to be in the position to decide intelligently for or against. Necessarily highly-complicated shapes, especially where it is a standard component or one in frequent request, are often best negotiated in the cast form. This may be all the more advisable where, in addition, mating conditions are exacting and strict interchangeability is a front rank consideration. It has also to be remembered that in many instances production costs as such show but little difference either way. The great advantages gained under favourable conditions are that patterns and core-boxes, and with them the necessity for storage of same, are eliminated, that weights are reduced and tensile strength increased, that shipping and transport limits are more readily met, and that the largely incalculable but frequently most serious casting strains are obviated.

While it is doubtless impossible to fix rules which are of universal application, the foregoing at least may be regarded as pointers aiding decision. Many factors enter into the expression to be solved, but these should not be overlooked.

E.H.T. DETECTORS.

Simple Apparatus for Use with Overhead Transmission Lines.

TRANSMISSION engineers may be interested to learn that Oswald Record and Co., of 17, Victoria Street, London, S.W.1, are acting as agents in Great Britain for the "Safety First" h.t. detector (Prof. Zipp system) which is manufactured by the Land and Sea Cable Works. This high tension indicator serves for ascertaining without danger whether or not the conductor of an a.c. line is alive. Its operation is based on the principle of displacement currents, and we understand it consists essentially of a condenser and a current indicator mounted in series. The condenser is tested under double the maximum tension for which the indicator is to be used. A Neon gas tube, mounted inside a strong glass tube, is used as current indicator. The narrow part of the vacuum tube is visible through a slot in the ebonite tube which forms the main portion of the device; a metal hook is provided at one end. The h.t. indicators are supplied with one condenser cell for a maximum tension up to 5 000 V, with two for a maximum of 10 000 V and with three for a maximum voltage of 15 000. The length of the ebonite tube thus varies according to the working tension.

The apparatus is used in the following manner:—The end remote from the hook is carefully connected to an earth wire, after which the hook is connected with the conductor to be tested. If the tube lights up the line is shown to be under tension. The tube begins to light up at about one-fifth of the maximum working tension.

WESTERN CENTRE I.E.E.

The Annual Dinner—The Electrical Industry and Coal.

COL. Sir Thomas Fortune Purves, the President, was the guest of honour at the annual dinner of the Western Centre of the I.E.E., held at the Royal Hotel, Cardiff, on January 13th, with Mr. Sidney B. Haslam, Chairman of the Centre, in the chair.

Alderman William Walker, in submitting the toast of "The Institution of Electrical Engineers," commented upon the fact that this Cardiff gathering was the first centre dinner at which he had seen women in attendance.

Col. Sir Thomas F. Purves, in reply, acknowledged the work which was being done by the Western Centre. The success of the centre showed very pointedly that London was not the only fountain of wisdom of the institution.

The toast of "Kindred Societies and Guests" was submitted by Mr. C. G. Morley New, the second past chairman of the Centre.

Principal George Knox, responding, commented upon the remarkable progress made by the electrical industry in a comparatively short time. They were indebted to the electrical engineer for some of the most promising things in life.

Sir Felix Pole, who also responded, said that whilst general manager of the Great Western Railway Co. he endeavoured to look after the transport interests and welfare of South Wales, and was always in Cardiff or elsewhere. With that experience he wanted, when he took over his new appointment as chairman of the Associated Electrical Industries, Ltd., to look after a little bit of electrical development in South Wales, but he was horrified to find that the representatives of the three companies which were operating the electrical industry in South Wales were sometimes taking their orders to what he might term overseas. He should have thought that South Wales had suffered enough from foreign competition without anyone daring to place orders for goods other than in South Wales.

He appealed to everybody in South Wales to support home industries. When he was at Paddington he fought many battles for South Wales, especially in the placing of orders for steel. He appreciated that every ton of steel rails made in South Wales provided employment, and he appealed to the electrical industry to give South Wales as many orders as possible. Whatever the position of other industries, he had discovered that the electrical industry in this country was up-to-date and efficient, and could claim to give the highest value per unit of price and capacity of any country in the world. He had great faith in the future development of the industry.

Other toasts honoured included "The Ladies," proposed by Mr. J. W. Beauchamp and responded to by Mrs. D. Watts-Morgan and Mrs. Morley New; "The Land We Live In," proposed by the Chairman and replied to by Brigadier-Gen. C. G. Bruce, and that of "The Chairman," proposed by Mr. Walter J. Bache.

N.E. COAST CARNIVAL.

Over a Thousand Guests to Attend E.D.A. Ball—Many Prizes Offered.

READERS in the North-East Area will be pleased to hear that the second electrical carnival, arranged by the British Electrical Development Association in Newcastle-on-Tyne, will be held in the Oxford Galleries, New Bridge Street, Newcastle-on-Tyne, on Friday, February 14th, 1930, when, at this early stage, one thousand guests are assured. The function promises to be even better than that held last year, and on this occasion the proceeds will be allocated to the Electrical Trades Benevolent Institution and the Institution of Electrical Engineers Benevolent Fund. A very large range of prizes is already to hand, provided very generously by various manufacturers throughout the country. These will be awarded to the winners of the various novelty dances, treasure hunts, holders of lucky programme numbers, etc., arranged for that night. Tickets (5s. each) may be obtained from the Area Officer, E.D.A. North East Area, Carliol House, Newcastle-upon-Tyne.

Portsmouth Electricity Committee has accepted a tender amounting to £3 985 6s. for the erection of a steel-framed switch house, and tenders aggregating £961 for the erection of three sub-stations.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

SUTTON COLDFIELD CORPORATION.—Manufacture and supply of paper-insulated, lead sheathed, double steel tape armoured cables. Specification, etc., from Mr. Thos. Bloore, borough electrical engineer, Electricity Works, Riland Road, Sutton Coldfield; deposit £1 1s.

COMMISSIONERS OF H.M. WORKS, January 24th.—Erection of submarine cable jetty at Dover. Specification, form of contract, etc., from Contracts Branch, King Charles Street, London, S.W.1; deposit, £1 1s.

LEEDS GUARDIANS, January 24th.—Electric light installation in six children's homes. Specification and form of tender from Mr. J. H. Ford, clerk to the Guardians, 11, South Parade, Leeds.

Supply of Copper Bonds.

LIVERPOOL CORPORATION, January 24th.—Supply of 10 300 copper bonds, 35 in. by 65 in. long. Forms of tender from the City Engineer, Municipal Buildings, Dale Street, Liverpool.

MANCHESTER CORPORATION, January 24th.—Supply of sheet steel neutral earthing cubicles, etc., for power transformers, Cumberland Street sub-station. Specification (No. 261) and form of tender from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

ECCLES CORPORATION, January 25th.—Supply of 250 kVA three-phase, oil-cooled transformer, 6 600/400 V, 50 cycles Specification, etc., from the Borough Electrical Engineer. Electricity Works, Cawdor Street, Patricroft, Lancs; deposit £1 1s.

NORWICH CORPORATION, January 28th.—Supply and erection of refrigerating plant at the Isolation Hospital. Specification, etc., from Mr. J. S. Bullough, city engineer, Guildhall, Norwich.

WEST HAM GUARDIANS, January 28th.—Installation of automatic internal telephone exchange at Children's Receiving Homes, Aldersbrook Road, Wanstead, London, E.11. Specification from the clerk, Mr. L. E. Fraquet, Board Room, Union Road, Leytonstone, London, E.11.

CLUTTON RURAL DISTRICT COUNCIL, January 29th.—Electric light installations in 55 houses. Specifications, etc., from the engineer, Mr. J. Wayne-Morgan, 6, Church Road, Whitchurch, Cardiff.

COWDENBEATH CORPORATION, January 29th.—Electrical work in connection with erection of 32 houses at Randolph Street, Cowdenbeath. Specifications, etc., from Mr. C. A. Alexander, burgh surveyor, Town House, Cowdenbeath; deposit £2 2s.

WORSLEY URBAN DISTRICT COUNCIL, January 29th.—Twelve months' supply of electric lamps, etc. Forms of tender from the surveyor, Mr. J. Howard, Town Hall, Walkden.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, January 30th.—Electric lighting installations at a block of tenement buildings in Bethnal Green. Specification, form of tender, etc., from Mr. David J. Keep, town clerk, Town Hall, Cambridge Road, London, E.2; deposit £2 2s. Technical inquiries may be made of Mr. Harold W. Couzens, 9, Old Queen Street, London, S.W.1.

ARMAGH COUNTY EDUCATION COMMITTEE, February 1st.—Electric lighting installation at Armagh New Public Elementary School. Plan and specification can be seen at the office of Mr. J. St. J. Phillips, 16, Donegall Square South, Belfast, or at the Education Offices, Armagh. Tender forms will be supplied.

CENTRAL ELECTRICITY BOARD, February 1st.—Supply and erection of 33 000 V overhead transmission lines in South-East England. Specification (No. S.E.E.—S.L. 3) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1 Charing Cross, London, W.C.2; deposit £2 2s.

CLUTTON GUARDIANS, February 1st.-February 14th.—Installation of electrically-driven forehole pump at the Institution, Temple Cloud, near Bristol. Specification, etc., from Mr. J. Wayne-Morgan, 6, Church Road, Whitchurch, Cardiff, until February 1st; deposit £1.

COWES URBAN DISTRICT COUNCIL, February 4th.—Electrical equipment, including wiring, provision of fittings, etc.; and supply and erection of private generating plant at Northwood House, Cowes, Isle of Wight. Plan of building can be seen at the office of Mr. J. W. Webster, engineer and surveyor, Northwood House, Cowes.

ISLINGTON (LONDON) BOROUGH COUNCIL, February 5th.—Supply of steel tube street lamp columns, with c.i. bases and swan-neck fittings; also supply of lanterns each suitable for containing three 300 W or three 500 W gasfilled lamps. Specifications and tender forms from the Borough Electrical Engineer, 60, Eden Grove, Holloway, London, N.7.

KENSINGTON (LONDON) BOROUGH COUNCIL, February 6th.—Twelve months' supply of street lanterns, lamp fittings, glass and electrical goods, lamp columns, etc. Forms of tender from the town clerk, Mr. Horace Rapson, Town Hall, Kensington, W.8.

INVERNESS DISTRICT BOARD OF CONTROL, February 7th.—Re-wiring of electrical installation at Inverness District Asylum. Specification from Mr. C. A. Grut, Electricity Offices, Waterloo Place, Inverness; deposit £2.

BASINGSTOKE CORPORATION, February 8th.—Supply and erection of two heavy oil engines, each coupled to 800 kW three phase 50 cycle alternator; one set to be ready by September 15th, 1930, and the other by September 15th, 1931. Tenders may be for either set or both sets. Specifications, etc., from Mr. F. Swarbrick, borough electrical engineer, Electricity Works, Brook Street, Basingstoke; deposit £1 1s.

PORTSMOUTH CORPORATION, February 10th.—Twelve months' supplies to the tramways department, including insulating materials, lamps and motor windings (section Q); overhead line materials (section R), etc. Specification and form of tender from Mr. B. Hall, general manager and engineer, Tramways Department, Guildhall, Portsmouth.

RUGBY RURAL DISTRICT COUNCIL, February 10th.—Electric lighting installations in connection with housing schemes: Wolston, 26 houses; Brandon, 12; London Road, Dunchurch, 16; Newton, 8; and Churchover, 12. Plans, etc., from the surveyor, Mr. J. E. Weeks, Temple Street, Rugby.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, February 11th.—Twelve months' supply of cables for street mains and services (tender form E.S.1); lamps (E.S 2), meters (E.S.3), creosoted cable protection boards (E.S.4); plywood meter boards and insulators (E.S.5); ironclad service cutouts (E.S.6); street lighting standards and electric fittings (E.S.7); and creosoted wood service tee boxes (E.S.8). Forms of tender from the Electrical Engineer, 37, High Street, Cheadle, Cheshire.

STOKE-ON-TRENT CORPORATION, February 12th.—Supply of an electric mail van (contract No. 3 001). Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

EDMONTON GUARDIANS, February 17th.—Six months' supply of electric lamps, X-ray, light and massage requisites, etc. Forms of tender, etc., from the clerk, Mr. E. Ridley, Board Room, 77, Bridport Road, Edmonton, London, N.18. Stamped addressed envelope to be sent.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 26th.—Twelve months' supply of electric lighting sundries, insulated wires, ordinary and prepayment meters, insulating compound; h.t. and l.t., concentric, paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer, 85, Fulham Palace Road, London, W.6.

Overseas.

UNLESS otherwise stated particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., January 24th.—Supply of cables and accessories, in connection with Madras improvements. Specifications and forms of tender (£1, not returnable) from the Company's offices, 91, Petty France, Westminster, S.W.1.

NEW ZEALAND POSTS AND TELEGRAPHS, January 28th.—Supply of condensers. (No. P. and T. 151/2 087). (Reference B.X. 6 031.)

Digitized by Google

NEW ZEALAND POSTS AND TELEGRAPHS, January 28th.—Supply of three-conductor plugs (No. P. and T. 151/2 056). (Reference B.X. 6 028).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates (Schedule No. C. 533). (Reference B.X. 5 899.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 29th.—Supply of condensers (P. and T. 151/2 087). (Reference B.X. 6 031.)

AUCKLAND MUNICIPALITY, January 30th.—Supply of three 3-ton petrol or electric vehicles, for refuse collection. (Reference A.X. 8 994.)

Bell Receivers for New Zealand.

NEW ZEALAND POSTS AND TELEGRAPHS, January 30th.—Supply of 500 bell receivers (P. and T. No. 151/2 088). (Reference B.X. 6 029.)

DUNEDIN DRAINAGE AND SEWERAGE BOARD, February 1st.—Supply of two centrifugal or propeller pumps, with electric motors and accessories (contract No. 737). (Reference A.X. 8 961.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct-coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

MELBOURNE CITY COUNCIL, February 3rd.—Supply of paper insulated cables (specification No. 1 016). (Reference B.X. 6 077.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 3rd.—Supply of protector blocks (carbon and porcelain). (Reference B.X. 5 948.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 4th.—Friction disc saw, with electric motor, for cutting steel joists and rails (tender No. P.W. 3/46). (Reference A.X. 8 998.)

INDIA STORE DEPARTMENT, February 5th.—Supply of 30 000 wood separators for train lighting cells. Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW ZEALAND POSTS AND TELEGRAPHS, February 5th.—Supply and delivery of indication alarm fuses. (Reference B.X. 5 947.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specificationNo. 30/3.) (Reference B.X. 5 844.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T., 151/2 025.) (Reference B.X. 5 955.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 13th.—Supply of electric tube butt welding set. (Reference B.X. 6 005.)

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, February 15th.—Supply of 1 771 metric tons of telegraph wire. (Reference A.X. 9 047.)

LOUIS TRIECHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of distribution system (poles, conductors, transformers, meters, sub-station equipment, etc.). (Reference B.X. 6 003.)

LOUIS TREICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of two 60 kW sets, comprising two boilers, one economiser, a steel chimney, two engines, two alternators, and accessories, or, alternatively, two 100 kW sets. (Reference A.X. 8 997).

Telephone Accessories.

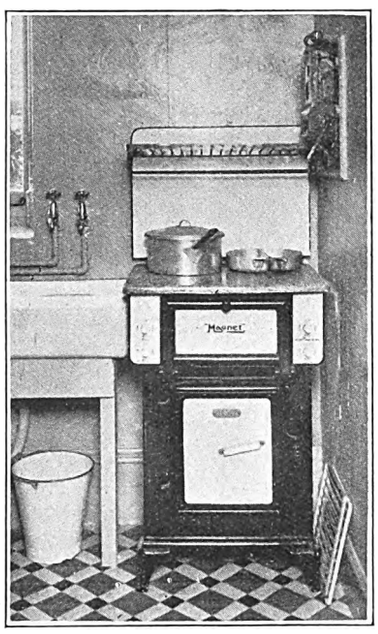
POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (schedule C. 541). (Reference B.X. 5 940.)

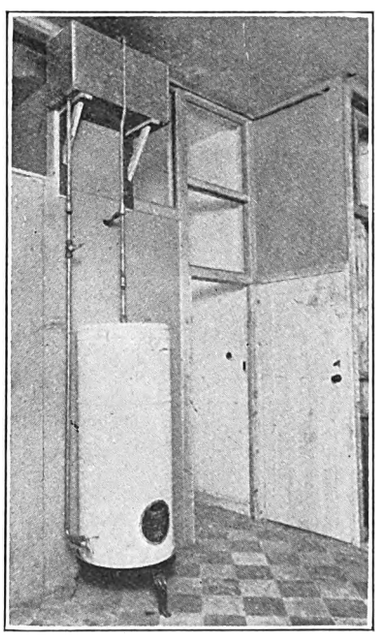
CHILEAN STATE RAILWAYS, February 19th.—Supply of apparatus and material for a signalling service between Maipu and Cartagena stations and between San Fernando and Talca stations. (Reference A.X. 9 008.)

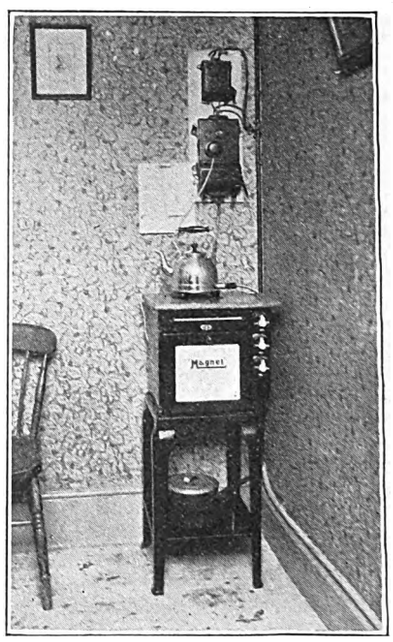
JOHANNESBURG MUNICIPALITY, February 20th.—Supply of switchgear (contract 322). (Reference B.X. 6 044.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of telephone switches. (Reference B.X. 6 018.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Reference B.X. 5 941.)







ENTHUSIASM for electric homes has been shown by a member of the Electrical Association for Women who is the owner of a hitherto unoccupied mansion at Walton-on-Thames. The building has been converted into two sets of 6-roomed, four sets of 4-roomed flats, and a series of seventeen 2-room flats. All have been extensively wired, heating outlets being provided in every room; the larger flats have been equipped with a "Magnet" cooker suitable for four or more persons, while the 2-roomed flats each are fitted with a "Magnet Minor" cooker and 3-pint copper electric kettle with automatic cut-out. The larger flats have their own bathrooms complete with "Magnet" water heaters, while the tenants of the 2-roomed flats have the use of separate bathrooms grouped at each end of the corridors. Hot water for each group of bathrooms is supplied by means of 30-gallon G.E.C. storage water heaters, thermostatically controlled, and the current used by these water heaters, of which there are three, together with that for corridor lighting throughout the building is paid for by the owner. By a special arrangement made with the Walton Electricity Department, the owner of the flats pays to the Council the fixed charge calculated to cover the requirements of the building as a whole, while the individual tenants purchase current as they use it through a slot meter in their own premises. The standard cooker installed in the larger flats is seen on the left with one of the three storage water heaters which serve groups of bathrooms for the smaller flats in the centre. The "Magnet Minor" cooker and electric kettle with which the smaller flats are equipped are shown on the right.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of switchboard plugs (schedule C. 548). (Reference B.X. 5 998.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of magneto and common battery telephones and automatic dials (schedule C. 544). (Reference B.X. 5 999.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 4th.—Supply of automatic exchange power boards (schedule C. 562.) (Reference B.X. 6 072.)

VICTORIAN ELECTRICITY COMMISSION, March 10th (extension of time).—Two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttleton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 11th.—Supply of bells and buzzers (schedule C.552). (Reference B.X. 6 0 3.)

POSTMASTER-GENERAL'S DEPARTMENT, March 24th.—Supply of dial parts (schedule C. 555). (Reference B.X. 6 047.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 25th.—Supply of cordless telephone switchboards (schedule C. 566). (Reference B.X. 6 071.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 1st.—Supply of submarine cable (schedule C. 561). (Reference B.X. 6 070.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o International Construction Co., Ltd., 56, Kingsway, London, W.C.2

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

Tenders Accepted.

WAR OFFICE.—C. Ramsay and Sons, electric light installation, Victoria Barracks, Beverley.

ROTHERHAM CORPORATION.—C. P. Parry, Ltd., two further soot blowers, £460 per set. (Recommended.)

GODALMING T.C.—Tangyes, Ltd., 6-stage turbine pump, belt driven from a 48 B.H.P. oil engine, £698.

DUBLIN CORPORATION.—Haden's Engineering Co., Ltd., electric lighting and power installation at the city abattoir, £1 897.

MANCHESTER CORPORATION.—Ferguson, Pailin, Ltd., 6 600 V feeder extensions; Revo Electric Co., Ltd., electric cookers. (Both recommended.)

ISLINGTON (LONDON) BOROUGH COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., supply of three feeder cubicles and accessories, £3 306.

BARKISLAND URBAN DISTRICT COUNCIL.—Electrical Distribution of Yorkshire, Ltd., public lighting, £3 12s. per lamp per annum, company to supply lamps.

LIVERPOOL CORPORATION.—English Electric Co., Ltd., supply of twelve 750 kVA three-phase 50 period, 6 600/400 V oil-cooled step-down transformers, for sub-stations, £279 each.

HARPENDEN URBAN DISTRICT COUNCIL.—North Metropolitan Electric Power Supply Co., extension of cable to sewage disposal works, and supply of motors, pumps, etc., £357 12s. 8d.

CAPE TOWN CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear, £6 741 7s. 6d.; A. Vaux, Ltd., supply of 250 fuses, £331 5s.; British Insulated Cables (S.A.), Ltd., supply of copper and galvanised iron wire, £4 609 5s. (All recommended).

INDIAN STORES DEPARTMENT.—General Electric Co. (India), Ltd., meter-testing equipment, Rs. 4 850; Balmer, Lawrie and Co., Ltd., pumping set, Rs. 2 301; Ingersoll Rand (India), Ltd., compressor sets, Rs. 11 897; Standard Telephones and Cables, Ltd., radio transmitter sets, Rs. 94 826; Greaves, Cotton and Co., Ltd., pumping plant, Rs. 16 219.

HACKNEY (LONDON) BOROUGH COUNCIL.—D.P. Battery Co., Ltd., replacement battery of mains service lorry, 308 Ah capacity at 5-hour rate, £215 12s., credit for old battery, £32. Also tendered: Chloride Electrical Storage Co., Ltd., 290 Ah, £250 3s.; alternative 232 Ah, £272 13s., credit for old battery, £22 3s.; Tudor Accumulator Co., Ltd., 296 Ah, £243 9s. 6d., credit for old battery, £16 15s.

GLASGOW CORPORATION.—Darroch and Espie, electric lighting installation at Shieldhall Hospital, £864 7s. 10d; Kilmarcock Engineering Co., Ltd., brake levers for bogie cars; Hackbridge Cable Co., Ltd., and Standard Telephones and Cables, Ltd., lead covered cable; Hadfields, Ltd., Titan Trackwork Co., Ltd., and Edgar Allen and Co., Ltd., tramway special work. (All recommended.)

BIRKENHEAD CORPORATION.—Ferguson, Pailin, Ltd., supply of feeder panel for Marshall Street sub-station, £69 8s.; George Ellison, supply of four oil circuit breakers, £82 4s. 6d.; General Electric Co., Ltd., transformer cubicle, £101, panel cubicle, £85, and feeder panel, £96. Supply of cables: W. T. Glover and Co., Ltd., £3 214 9s. 6d.; Hackbridge Cable Co., Ltd., £1 405; Macintosh Cable Co., Ltd., £2 257 16s.

MANCHESTER CORPORATION.—Bertram Thomas, extensions to electric main switch; Crompton Parkinson, Ltd., English Electric Co., Ltd., Ferranti, Ltd., and C. A. Parsons and Co., Ltd., static transformers; Chloride Electrical Storage Co., Ltd., replacement battery for electric tower wagon. Electrical installations at Blackley, Newton Heath, Chorlton and Wythenshawe Estates: R. H. Clampett and Co., G. F. Latham, Hall and Stinson, Ltd., and F. L. Napier and Co. Metropolitan Electric Cable and Construction Co., Ltd., electric cables, Longdendale; Forest City Electric Co., Ltd., supply of tramway rail bonds; J. Adams, Ltd., electrical installations at New Moston New School and Levenshulme High School for Girls; A. E. Sudlow and Co., electric lighting installations at Varna Street Infants' School and St. Mary's Road Municipal School.

STOKER EQUIPMENT FOR BATTERSEA.

Order Placed for First Section—The Plant in Brief.

IN view of the prominence which the daily Press has recently given to the subject of smokeless combustion—referring more particularly to the proposed Battersea station—it is interesting to note that the engineers of the London Power Co. have placed an order with the Taylor Stoker Co., Ltd., of Bush House, Aldwych, London, W.C., for the complete fuel-burning equipment for the first section of this station to be constructed. This equipment comprises six Taylor multiple retort underfeed stokers, each twenty retorts wide and forty-nine tuyeres long. These stokers will be equipped with rotary ash discharge mechanism which consists of a deep pocket at the rear of the stoker proper, at the bottom of which are two large, slowly revolving crusher rolls. Preheated air of 330 deg. F. will be used. The stokers will fire six boilers, and each unit will be capable of producing 350 000 lb. of steam per hour continuously at 600 lb. pressure. Any pair of these units will supply sufficient steam for one 65 000 kW turbine at full load.

The new "Kraftwerk-West" of the Berlin Electric Co., is to be supplied with eight equipments of similar design and steam output.

WORK IN PROSPECT.

ABINGDON.—Housing scheme (50). Particulars, the Borough Surveyor.

BARNSLEY.—School (640 places). Particulars, Mr. A. D. Mason.

BARNSLEY.—Town Hall to cost £130 000. Particulars, the Borough Surveyor.

BEXLEY HEATH.—Church and hall. Particulars, Mr. G. E. Burgess, Dartford.

BIRKENHEAD.—School, Rock Ferry. Particulars, Mr. R. W. Johnston.

CAMBRIDGE. Extensions, Boys' school, to cost £5 800. Particulars, the County Architect, Cambridge.

CREWE.—Additional 45 houses. Particulars, the Borough Surveyor.

CRONBERRY.—School. Particulars, the Clerk, Ayr.

DIDCOT.—Senior school (300 places). Particulars, Mr. W. C. F. Anderson, Reading.

DUMFRIES.—Town Hall to cost £45 000. Particulars, Mr. James Carruthers, Glasgow.

HAYDOCK.—School to cost £36 000. Particulars, the County Architect. Preston.

HEREFORD.—Housing scheme (40). Particulars, Bettington and Son, Palace Chambers.

HOYLAND NETHER.—School (250 places). Particulars, the Clerk, County Hall, Wakefield.

NEWSOME (YORKS).—Housing scheme (115). Particulars, the Surveyor.

PAULTON.—School extensions. Particulars, Mr. A. J. Pictor, 14, Queens Square, Bath.

PRESTON.—Houses. Particulars, P. A. Baines and Sons, and Mr. A. Swarbrick.

SIDCUP.—School (250 places). Particulars, Mr. E. S. Davies, director of education, Maidstone.

SLOUGH.—Block of factories, for Slough Estates, Ltd.

ST. HELENS.—Houses. Particulars, Messrs. Chappell and Sons, Ltd., Swinton, Manchester.

TAMWORTH.—Houses (90). Particulars, Eadie Towers and Co., Wolverhampton.

TRURO.—Extensions, Royal Cornwall Infirmary. Particulars, Messrs. Cowell, Drewitt and Wheatley, Mansion House.

TUNBRIDGE WELLS.—School to cost £24 000. Particulars, the Director of Education.

WAKEFIELD.—150 all-electric houses on the Eastern Estate. Particulars, the City Architect.

WATFORD.—Additional housing scheme (600). Particulars, from Borough Surveyor.

WHITEHAVEN.—School. Particulars, the Borough Engineer.

WINDSOR.—Houses (26). Particulars, Cain and Co., Hounslow.

WISBECH.—Post office and telephone exchange for the Commissioner of Works. Particulars, Contracts Branch, H.M. Office of Works, King Charles Street, S.W.1.

WORKINGTON.—New maternity ward at the Infirmary. Particulars, Mr. H. Oldfield.

WREXHAM.—Housing scheme (160). Particulars, Mr. J. H. Edwards, Imperial Buildings.

WREXHAM.—Houses. Particulars, Mr. T. Heywood, Ellesmere Port; Mr. Alun Edwards, Ffrith; Griffiths Bros., Rhos; Mr. Aneurin Roberts, Rhos; Mr. O. D. Stephens, Bersham; and additional 140 houses. Particulars, the Surveyor.

CANADIAN TELEPHONE DEVELOPMENTS.

THE Bell Telephone Company of Canada is contructing in Ontario, at a cost of $1 500 000, a new line from Oshawa to Sudbury, via North Bay. The line, about 300 miles long, will be operated on the "wired wireless" principle, making it possible for eight persons to converse at one time over the same pair of wires, or for two people to talk and 40 people to be in communication on teletype or telegraph simultaneously.

Construction will be completed in a year from the beginning of operations, and the line will handle not only the increasing telephone business between Toronto and the northern Ontario mining districts, but will be a link in the Atlantic-Pacific system. On the completion of this transcontinental project, now being brought into existence by co-operation between the Bell Telephone Company and the various telephone systems in the Maritime Provinces and Western Canada, persons in Halifax will be able to talk to Vancouver over an all-Canadian route.

IMPORT TARIFFS.

New Duties Proposed under Revised Egyptian Customs Tariff.

THE modified Egyptian Import Tariff, which it is proposed to put into force on February 17th, contains the items set out below. The rates of duty are stated in millièmes, indicated by "m." 1 000 m. equal £E./1=£1 os. 6d. sterling: Electric generators, electric motors and transformers, weighing:—(a) 1 000 kg. and over, 800 m. per 100 kg.; (b) from 50 to 1 000 kg. exclusive, 1 200 m. per 100 kg.; (c) from 10 kg. to 50 kg. exclusive, 1 800 m. per 100 kg.; (d) less than 10 kg., 3 000 m. per 100 kg. Electric locomotives, 400 m. per 100 kg. Electric batteries and parts, 12% *ad val.*. Electric accumulators and parts, 1 800 m. per 100 kg. Magnetos and sparking apparatus for internal-combustion motors, 120 m. per kg. Electric fans, 12% *ad. val.* Arc lamps, and metallic parts, 50 m. per kg. Electric lamps and valves: (a) For wireless, 300 m. per kg.; (b) Other, 150 m. per kg. Telegraphic and telephonic apparatus of all kinds, including wireless telephone and wireless telegraph apparatus, 12% *ad. val.* Electric signalling and safety apparatus for railway and other purposes, 10% *ad. val.* Electro-medical apparatus, including that used for dentistry, 8% *ad. val.* Electric heating apparatus, electric and electro-technical apparatus for domestic use; (a) Electric irons, and detached parts thereof, 15% *ad. val.*; (b) Other, 15% *ad val.* Insulated wire and cables for electric use: (a) Submarine and underground cables, 500 m. per 100 kg.; (b) Other, 15 m. per kg. Parts and articles of carbon, agglomerated or baked, for electrical use, 45 m. per kg. Parts, mainly for electrical use, made of insulating materials, not specially mentioned in the Tariff: (a) Of porcelain, faience, earthenware, stoneware, glass and the like: (1) Weighing 100 grms. or more each, 5 m. per kg.; (2) Weighing less than 100 grms. each, 12 m. per kg.; (b) Of asbestos or asbestos board, stabilite, mica, micanite, meglionite, ambroine, bakelite, rubber, ebonite, vulcanised fibre, galalith and other similar materials, without parts of metal or other materials, 35 m. per kg.; (c) Insulating tubes, and joints and junction boxes for insulating tubes: (1) Without metallic covering, 45 m. per kg.; (2) Other, 12 m. per kg. Parts made of insulating materials combined with parts of metal or other materials fall under the classification of electrical and electro-technical apparatus and parts, upon which the duty is 10% *ad val.*) Electrical and electro-technical apparatus and parts thereof, parts of dynamo-electric machines and apparatus for the application of electricity in general, not elsewhere specified, of any weight, 10% *ad val.* Electric meters and apparatus of all kinds for measuring electricity, 15% *ad. val.*

Australian Tariff Amendments.

The following are further amendments of the Australian Customs Tariff which became operative on November 22nd, 1929. The rates under the British preferential tariff are indicated by (*a*), and those under the general tariff by (*b*), the previous rates being given in parentheses: Electrical fittings wholly or partly of metal, viz.: switches, fuses, and lightning arresters, n.e.i. (*a*) 65% (35%); (*b*) 75% (50%). Regulating, starting and controlling apparatus for electrical purposes, including distributing boards and switchboards, n.e.i. (*a*) 65% (35%); (*b*) 75% (50%). Dynamo-electric machines: a.c. motors, 1 H.P. to 125 H.P. (*a*) £5 each, and in addition 55s. per H.P., or 45% *ad val.*, whichever is the higher (40% each motor over 75 H.P., or 45% up to 75 H.P.), (*b*) £5 each, and in addition 15s. per H.P. or 60%, whichever is the higher (55% each motor over 75 H.P., or 60% up to 75 H.P.). Static transformers, up to 25 kVA (*a*) 50s. per kVA, or 60% (35%), (*b*) 50s. per kVA, 75% (50%); (*a*) over 25 kVA, up to 150 kVA, 25s. per kVA, or 60% (35%); (*b*) 25s. per kVA, or 75% (50%); over 150 kVA up to 500 kVA, (*a*) 15s. per kVA, or 60% (35%), (*b*) 15s. per kVA, or 75% (50%); static transformers n.e.i., including induction coils, (*a*) 60% (35%), (*b*) 75% (50%). Current rectifiers, (*a*) 45% (40% over 75 kW, or 45% up to 75 kW); (*b*) 60% (55% or 60%). Ironclad or moulded switches; ironclad or moulded airbreak switches and fuses combined, up to 60 A, (*a*) 8s. each, or 65%, whichever is the higher (3s. or 45%), (*b*) 10s. or 75% (5s. or 60%); over 60 A, (*a*) 65% (3s. or 45%); (*b*) 75% (5s. or 60%). Dry batteries and cells, up to 1 lb. each, 4d. each (27½%); (*b*) 6d. each (40%); over 1 lb., 7d. each (27½%); (*b*) 10d. each (40%).

The operation of the deferred duty on electrical mining fuses is further postponed to January 1st, 1931.

ELECTRIC TRACTION.

Three-mile Extension of the Metropolitan Electric Railway.

AN extension of the Metropolitan Railway, about three miles in length, is to be constructed from Preston Road (between Wembley Park and Harrow) to Canons Park, Little Stanmore.

Portsmouth Corporation is to promote a Bill in Parliament to provide for the substitution of trolley vehicle systems for the tramways of the Corporation, with power to the Minister of Transport to authorise further trolley vehicle routes within and outside the city.

Eight stations on the proposed Piccadilly Tube Railway extension from Finsbury Park to Cockfosters will be at Manor House Corner, Turnpike Lane, Wood Green, Brownlow Road (Bounds Green Road), Arno's Grove (Bowes Road), Southgate Chase Side, East Barnet Road, and Cockfosters. It is hoped to obtain Parliamentary sanction by the end of July, and the work on the extension will then begin.

London County Council has allocated £5 000 for the construction of an experimental tramcar of a new pattern. Several different designs have been suggested by experts, and one of the suggestions is that vestibule ends should be provided as an integral part of the car, to accommodate about 20 more standing passengers than those carried on the present cars, while another change proposed is that entrances should be at the ends of cars and not at the sides, so as to avoid passing vehicles.

Torquay Corporation has resolved to sanction, under certain conditions, the substitution by the Tramways Co. of trolley buses for the existing tramcars. One of the principal factors leading to this decision is the congestion which is said to be caused by the trams in the main streets. The agreement with the Company provides that the Corporation shall have the option at the expiration of 14 years, and at the end of every subsequent seventh year, of purchasing the undertaking, and all the electrical energy has to be taken from the Corporation's works.

Of the total expenditure of £4 300 000 authorised by the Southern Railway directors for the present year, nearly £600 000 is to be devoted to electrification. The sections of line to be electrified this year, in addition to the Reigate, Redhill, Brighton, and Worthing routes already announced, are Twickenham to Windsor (27 miles), and Dartford to Gravesend (14 miles). Work on the long section between Twickenham and Windsor will cost £366 000, and the Dartford scheme £159 500.

THE LEAD MARKET.

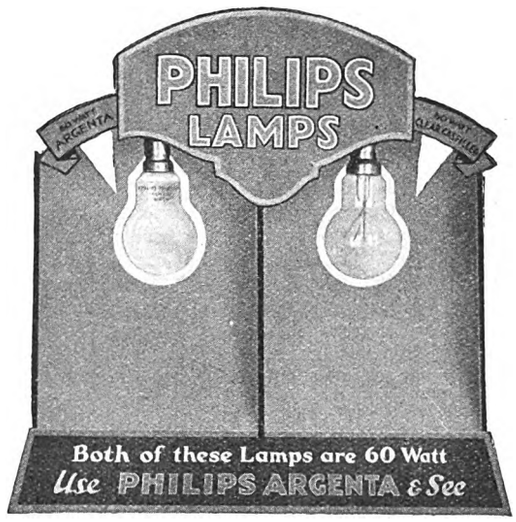
According to James Forster and Co., the lead market has been quiet, and closing prices on January 17th were £21 10s. for January, £21 11s. 3d. for February, March and April, or again unchanged on the week.

TRADE PUBLICATIONS.

THE current stock list of HIGGS MOTORS, LTD., Witton, Birmingham, has been received.

The current stock list of the A.E.G. ELECTRIC LTD., 131, Victoria Street, London, S.W.1, is now available.

The current stock list of WOLF AND MORGAN, LTD., 66, Victoria Street, London, S.W.1, has been sent to us.



A highly decorative cardboard stand which has been designed to demonstrate the superiority of the opal lamp over the clear gasfilled lamp for most home lighting purposes. This publicity material is offered free by Philips Lamps Ltd.

"Hot Water in the Home" is the title given to a new publication by SADIA, LTD., 22, Newman Street, London, W.1.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have issued list No. 181 dealing with "Argenta" lamps.

Two new illumination glassware lists have been published by W. E. BEARDSALL AND CO., LTD., 5, Victoria Bridge, Manchester.

Publication P.F.66, dealing with "Copperweld" earthing rods, has been published by BRITISH INSULATED CABLES, LTD., Prescot, Lancs.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have issued a new edition of list No. 192L dealing with "Arlita" lamps.

Catalogue No. 160, dealing with street lighting, has been published by HOLOPHANE, LTD., Elverton Street, Vincent Square, London, S.W.1.

Colour folder S.L. 5277, relative to stage lighting effects has been issued by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2.

The ELECTRICAL EQUIPMENT AND CARBON CO., LTD., 107, New Oxford Street, London, W.C.1, has published list No. M.17 entitled "Elm Mercury Rectifiers."

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., has issued leaflet No. 6 620, dealing with components for the "Magic Four" receiver.

ALLOY WELDING PROCESSES, LTD., Ferry Lane Works, Forest Road, London, E.17, have sent us a copy of Bulletin No. 55 entitled the "A. W. P. Hire Service System."

A well-produced leaflet entitled "Some Thoughts on Automatic Control for A.C. Motors," has been produced by BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester.

The 1930 catalogue of RUNBAKEN MOTOR AND ELECTRICAL ACCESSORIES, LTD., Magneto Works, Ardwick, Manchester, has been received and this includes a number of new accessories.

The Callender C.T.S. wiring system is dealt with in a special publication just issued by CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., Hamilton House, Victoria Embankment, London, E.C.4.

FRANCIS POLDEN AND CO., LTD., 56, Cannon Street, London, E.C.4, have issued in leaflet form illustrations of a number of different classes of buildings in which they have put complete installations, including the Olympia, London; Bawdsey Manor, Felixstowe; Denham Place, Denham; Walton Hall, Warrington; and the National Safe Deposit building.

ELECTRICITY SUPPLY.

Rural Supplies at Omagh—North Wales Co's Rural Scheme—Sale of Monmouth Undertaking—Biggar Council Adopts Electric Street Lighting—Hull's Change-over Proposals—Unemployment Relief Grants for Electrical Works.

STOKE NEWINGTON (London) Electricity Committee is to extend cables at a cost of £1 353.

Hackney (London) Electricity Committee seeks sanction to borrow £5 000 for the free-wired prepayment scheme.

Tunbridge Wells T.C. has applied to the Commissioners for loans of £13 201 for mains extensions, and £1 514 for sub-station pillars and equipment.

Ballymoney ratepayers have decided by 90 votes to 78 against purchase by the U.D.C. of the undertaking of the Ballymoney Light and Power Co.

Marlborough T.C. having failed to obtain a supply of electricity in bulk from Swindon Corporation, is negotiating for a supply from the Wessex Electricity Co.

Omagh R.D.C. has decided to give its consent to the proposed Order which will enable the Urban Council to supply supplies of electricity to consumers in the rural area.

Bradford Electricity Committee recommends the provision of additional feeders, at a cost of £6 250, in connection with the substitution of railless vehicles for trams on the Allerton route.

The Generating Station Committee of the Stalybridge, Hyde, Moseley and Dukinfield Joint Board has granted the Central Electricity Board a site for a new sub-station at Hartshead, Stalybridge.

The North Wales Power Co. has applied under the Development Act for grants in aid of a scheme for the completion of the transmission scheme to place electricity supply within reach of every part of rural North Wales.

Colchester Corporation has applied for a loan of £7 107 for the proposed line from the generating station to Ardleigh. This sum includes £1 501 13s. 6d. for e.h.t. cables, £4·628 12s.6d. for e.h.t. overhead lines, and £429 for a transformer and switchgear.

Consent has been given by Darlington R.D.C. to an application by the Corporation to extend its supply of electricity to a number of parishes in the rural area. Under the proposed Order, the maximum price is to be 10d. per unit, but it is stated that the actual charge will be about 6d.

Sanction has been received by Winchester Corporation to a loan of £2 053, in connection with a supply of electricity to Twyford and Compton. The charges are to be 5d. per kWh for power and 9d. per kWh for any other use.—A supply is to be given to houses which are being erected at St. Martin's Close.

Monmouth T.C, decided last week to sell its electricity supply undertaking to the General Electric Co. The purchase price was stated to be £14 000, the corporation retaining its obligation to discharge the sum still remaining due on loans, which, at the end of the financial year, will be about £3 900.

Burnley Corporation electricity undertaking supplied 198 electric fires to consumers during December last. Heating and domestic appliances connected now amount to 10 024 kW, an increase of 2 446 kW during the past year. The new electricity showrooms disposed during the year of appliances valued at £8 684.

Biggar T.C. has unanimously resolved to adopt electricity in place of gas for public lighting. Terms have been arranged with the Clyde Valley Electrical Power Co. for carrying out the work. A fair response from residents and shopkeepers resulted from a recent canvass by the company to ascertain the probable number of private consumers.

Bacup T.C. has decided to submit schemes for the extensions of electricity mains, involving an expenditure of £10 900, to the Unemployment Grants Committee, as an unemployment relief scheme. Mr. J. Ireland, chairman of the Electricity Committee, states that the expenditure will bring no charge to the rates, as it can be borne by the electricity undertaking.

The Unemployment Grants Committee has notified a grant to Sunderland Corporation of 50% of the interest on approved expenditure out of a loan not exceeding £133 704 for laying electric mains and the erection of electrical apparatus in connection with the corporation's electricity undertaking. It is proposed to raise £99 655 of the loan for 20 years, and £34 059 for seven years.

Hull Electricity Committee has agreed to a 10% reduction of the charge for electricity for power purposes.—The Committee has decided to agree to an application to the Electricity Commission for consent to the changing over of the whole area from d.c. to a.c., so that the change can be carried out as and when convenient to the Corporation, without further application to the Commissioners.

Bexhill T. C. has decided to provide a sub-station at Mount Idol Farm at an estimated cost of £2 757, to extend the h.t. cable at a cost of £1 635, to provide a l.t. feeder, £1 471 15s.10d., and to lay a distributor cable through Mayo Lane to Watermill Lane, £353 6s. 2d. The Electrical Engineer has submitted a scheme for extensions in the north part of the town, including Sidley, at a cost of about £11 500.

Application is to be made by Manchester Electricity Committee to the Electricity Commissioners and to the South-East Lancashire Electricity Advisory Board for sanction to instal the additional boiler plant now required at the Barton station.—The Committee has obtained sanctions to borrow £250 000 for new distributor mains; £6 000 for sub-station building; and £34 000 for sub-station plant.

Rotherham Corporation seeks powers to extend the area for the supply of electricity to parts of the parishes of Ecclesfield and Wentworth, and to exclude such parts from the area of supply of any other undertakings. The Electricity Committee is asking for authority to abstract water from the river Don and the Sheffield and South Yorkshire Navigation, for the purposes of the electricity generating stations.

Birkenhead Electricity Committee has decided to proceed with the provision and laying of 6 600 V mains from Bentinck Street works to South End sub-station, from South End sub-station to New Ferry sub-station, from Borough Road to Bedford Avenue, and from Stanley Road to Gautby Road, the erection of two kiosks and the installation of two 200 kVA transformers, and switchgear in connection with the extensions.

The Central Electricity Board has asked whether Bradford City Council desires to be heard in connection with an application to be made by the Board to the Ministry of Transport for consent to the placing in the city of overhead lines in connection with the Bradford-Kirkstall-Wakefield transmission. It has been decided to endeavour to secure an alteration of the route or to express a desire to be heard on the application.

Mr. J. W. Burr, borough electrical engineer of Swansea, recommends, with a view to relieving unemployment, that works to be put in hand forthwith should include replacement of the existing d.c. distributors and feeders, and the whole of the a.c. mains which are fed through triple concentric cables in the following areas: Swansea, west, £28 050; centre of town, £25 969; Swansea north, £6 435; and Morriston, £7 507. The Electricity Committee has adopted the recommendations.

Crewe T.C. has received from the Electricity Commissioners a suggestion that electricity mains should be laid in any street in which there is a reasonable prospect that within the next three years the annual revenue would defray the additional outgoings, with a view to assisting the Government in dealing with unemployment. The Commissioners have also urged the initiation of schemes of assisted wiring and extended facilities for the hire and purchase of electrical apparatus. The Electricity Committee has instructed the Engineer to prepare a scheme for the laying of a cable in every street in the town not already provided for.

Hastings Electricity Committee has reported to the Town Council on schemes for relief of unemployment, following a communication from the Electricity Commissioners. These deal with laying conduits and with overhead and underground lines, etc., for the Hastings, Bexhill, and extended areas, amounting to £64 912, and the Committee, on being informed that the maximum financial assistance obtainable amounted to 50% of interest on loan (£947 per annum) recommended that the work be carried out. The council has adopted the report.—The Electricity Committee has prepared schemes for extensions in the town, including a feeder for bulk supply to Bexhill at a cost of £37 887.

COMPANY NEWS.

Little Increased Activity in Electrical Share Market—Allocation of Communications Co's. Shares—Ever Ready Co's. Increasing Sales—Reports and Dividends.

BUSINESS in the market for electrical supply, transport and equipment stocks and shares has not yet shown much increased activity; and few outstanding features are shown by our usual tabular contrast of price quotations.

Radio Corporation of America shares have fallen nearly to 36, which is seven points below the figure of a week ago. Hydro-Electrics are a little lower at under 43, as are also International Holdings at 5½. Cables and Wireless issues still hang fire, and the "B" stock has given way a couple of points to 35½. Eastern Telegraph 3½% per cent. preference stock has recovered a point, and is again 62½.

In the manufacturing section, British Insulated Cables, Callender's Cable and W. T. Henley's ordinary shares have each risen 1s. 3d., to £3 18s. 9d., £3 13s. 9d. and £6 1s. 3d. per share respectively. British Thomson-Houston preference have improved from 22s. 9d. to 23s. 3d. and General Electric "B" preference from 25s. 6d. to 26s. Associated Electrical Industries ordinary are 6d. better at 28s. Ever Ready ordinary have fallen from 18s. 9d. to 18s. 6d., but 7% participating preference are firm at 29..

The principal movement among electricity supply companies' descriptions has been a rise of 3s. 9d. in Bournemouth and Poole ordinary shares, bringing the price up again to the mid-November level of 61s. 3d. Scottish Power Co. ordinary shares are up 1s. to 30s., and London Power Co. 5% debenture stock and Tokyo mortgage sterling bonds are each a point higher at 100 and 93, respectively.

The railway and tramway group makes a good showing, with 2-point rises in a number of instances. British Electric Traction preferred ordinary stock is up from 122½ to 124½, and City and South London ordinary from 67 to 69. Metropolitan ordinary stock has risen from 64 to 66½, and District from 72½ to 74. London Electric ordinary stock is a point higher at 72½, and Underground Electric Rlys. ord. shs. have spurted 1s. 6d., from 22s. to 23s. 6d. Rio de Janeiro Tramway Bonds are a couple of points higher at 85½. Metropolitan District Preference have also risen a point to 80½.

Directors' Reports, etc.

ATLAS ELECTRIC AND GENERAL TRUST.—Intm. div. of 2%, less tax (same as last year), will be payable on Feb. 15.

ALLIED POWER AND LIGHT CO.—Qrtrly. divs. of $1·25 p. sh. on $5 1st pfd. and 75 c. p. sh. on $3 pref. will be payable on Feb. 15.

DELHI ELECTRIC SUPPLY AND TRACTION CO., LTD.—Intm. div. of 4%, less tax (same as last year), will be payable on Jan. 31.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—Transfer books and register of members of 7½% cum. pref. shs. are closed until Jan. 31, inclusive, preparatory to paymt. of half yearly div.

ELIN AKTIENGESELLSCHAFT FUR ELEKTRISCHE INDUSTRIE, VIENNA.—Coupons falling due on Jan. 31 off 7½% 25-year bonds should be presented for payment at the offices of Messrs. Helbert, Wagg and Co., Ltd., 41, Threadneedle Street, London, E.C.2. Coupons to be left three clear days.

NORTH AMERICAN EDISON CO.—An issue of $25 000 000 (£5 000 000) 40-year 5% debs. of North American Edison Co. was made in New York on Jan. 15. The debs. were priced at 95½ to yield over 5·25%. Proceeds of issue are to be used for makg. additnl. investmts. in subsidiaries of the North American Edison Co.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—The poll demanded at the mtg. on Jan. 10, in regard to the proposals of the directors regardg. the limitatn. of the maximum number of shs. to be held by foreign shhldrs., has resulted in 1 061 438 votes being cast in favour of the proposals and 77 071 agst. The requisite three-fourths majority in favour of the scheme has therefore been secured.

WEST INDIA AND PANAMA TELEGRAPH CO., LTD.—An extraordinary mtg. of the company will be held on Feb. 3 to consider resolutns. providg. that no more than 25% (nom. value) of issued amt. of any class of shs. may be held by or in trust for, or be under the control of other than British subjects or corporations; and that only British subjects may be appointed directors (except directors of Cables and Wireless, Ltd.)

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—The board has declared regular qrtrly. cash div. on ord. shs. of 50 cents p. sh., payable on March 1. Announcement was recently made of the intention of the directors to declare a stk. div. of 1% on the ord. shs. subject to the obtaing. of the necessary supplementary letters patent. Formal notice is now given of a mtg. to be held on Feb. 4 to authorise the company to apply for the supplementary letters patent.

CEARA TRAMWAY, LIGHT AND POWER CO., LTD.—Net rev. for year ended June 30, £28 147, agst. £27 572. Deb. int. required £9 977, agst. £9 993. To res. £12 500 (same as last year). Div. 5%, less tax (same). Fwd. £8 832, agst. £7 737. Tramway receipts continued to fall, owing to omnibus competitn. Loss was offset by increase in sale of current for power purposes and receipts from company's omnibuses. Increase in demand for power makes further extensn. of generatg. plant necessary. Orders are about to be placed for complete new unit which will double present effective capacity.

CITIES SERVICE CO.—Net earngs. for 1929, $43 452 386, an increase of over 29%. To stks. and reserves $36 477 185, or 5·30 times pfd. divs. (agst. 4·38 times). To com. stks. and reserves $29 591 440, or $1·18 p. sh. (inc. $6 714 685, or 29·35%). Extent of subsidiaries' operatns. was correspondingly increased during year. Over $100 000 000, was spent for constructn. and acquistns. in 1929. In public utility divisn. most important developmt. was formatn. of East Tennessee Power and Light Co. Number of hldrs. of Cities Service Common stk. increased from 100 000 to 349 000 and hldrs. of all Cities Service securities now number over 600 000. For 1930 an expansn. programme involvg. expenditure of $150 000 000 is announced.

COMPANIES STRUCK OFF THE REGISTER.—The following companies have been struck off the Register of Joint Stock Companies: Aladdin Lamps (Midlands); Electric Car and Accessories Co.; Farad Electrical Co.; F. C. Brown (Electricity); General Battery Co.; Midland Radiotelephone Mfrs.; N.S. Battery and Equipment Co.; Win-sum Electric Diffusers; Auto-Sign Co.; Skipton Electrical Co.; Wireless Distributing Co. The following will be struck off the Register unless cause to the contrary is shown before Jan. 29: Electrification; Northern Radio and Electrical Factors; Power Patents. The following will be struck off unless cause to the contrary is shown before March 17: Dartmoor Electric Supply Co.; Magneto and Spare Part Co.

ADELAIDE ELECTRIC SUPPLY CO., LTD.—Gross rev. for year ended Aug. 31, 1929, £839 156, agst. £801 514; operatg. exes. and taxes £388 432, agst. £389 568; net rev., £450 724, agst. £411 946. After writg. off cost of issue of new cap. and scrapped plant, etc., and providg. for int. and sinkg. funds on deb. stks., blce. on net rev. acct. is £331 533. To gen. res., £90 000, makg. £270 000, to contingency res. £15 000. Fwd. £226 533. After providg. for div. on preference shs., intm. div. on 8% pfd. ord. shs., and intm. div. of 6% on ord. shs., directors recommend fin. div. for second half-year on 8% pfd. ord. shs., and fin. div. of 6% on ord. shs., makg. 12% for year, leavg. £127, to which is added £31 902 brt. fwd., makg. £32 029 to be carried fwd. Reserves available for depreciatn. and contingencies stand as follows: gen. res., £270 000; div. equalisatn. acct., £60 000; contingency res., £15 000; sinkg. funds, £275 426; pft. and loss acct., £32 030, total £652 456. Area of district covered by company's statutory powers is approximately 3 314 sq. miles, with estimated populatn. of 325 000, and a supply of electric light and power is now available in 1 240 miles of streets, increase 75 miles during year. New consumers connected during year 2 855, bringing total number connected to 82 495.

IMPERIAL AND INTERNATIONAL COMMUNICATIONS, LTD.—The company announces that for the purpose of acquirg. the whole or part of the undertakgs. of the undermentioned companies, and for providg. for the purchase price of the Pacific Cable Board's Pacific cable undertakg. and West Indian telegraph system, and of the Imperial Atlantic Cables, the sh. cap. of the company has been increased from £100 to £30 000 000 divided into ord. shs. of £1 each. These shs. have been allotted as follows: Eastern Telegraph Co., Ltd. (*a*) in respect of transfer of communicatns. assets, 10 626 608, (*b*) at par in respect of cash provided for purchase of Government undertakgs., 552 947; Eastern Extension, Australasia and China Telegraph Co., Ltd., (*a*) 6 533 050, (*b*) 287 957; Western Telegraph Co., Ltd., (*a*) 4 724 845; (*b*) 239 333; Marconi's Wireless Telegraph Co., Ltd., (*a*) 4 225 517; (*b*) 186 249; African Direct Telegraph Co., Ltd., (*a*) 330 397; Europe and Azores Telegraph Co., Ltd., (*a*) 132 689; Eastern and South African Telegraph Co., Ltd., (*a*) 1 414 439; West African Telegraph Co., Ltd., (*a*) 206 105; London Platino-Brazilian Telegraph Co., Ltd., (*a*) 193 481; Pacific and European Telegraph Co., Ltd., (*a*) 89 587; River Plate Telegraph Co., Ltd., (*a*) 31 928; West Coast of America Telegraph Co., Ltd., (*a*) 224 868; total, 30 000 000.

Company Meeting.

EVER READY TRUST AND FINANCE CO., LTD.—Mr. Magnus Goodfellow, presiding at the meeting last Friday, said they had co-operated with the Ever Ready Co. (Great Britain) in the acquisition of an interest in Lissen, Ltd., which interest (so far as the Trust were concerned) was represented by the holding of 500 000 8% cumulative preference shares. It was not the intention of the directors to hold so large an investment in one concern indefinitely, and it was, therefore, provided at the time of the purchase that there should be a public flotation of Lissen, Ltd. The state of the stock market during the year, however, had not been such as to enable this intention to be carried into effect. Being a private company, there was no market quotation for the shares of Lissen, Ltd., but the accounts of that company for the year ended September, 1929, showed a substantial advance in profits compared with the previous year. As to the Trust's holding of 128 845 ordinary shares of the Ever Ready Co., the market price to-day showed a depreciation compared with the cost of £29 000, which he was satisfied was due to general conditions only, for having regard to the unbroken progress of that company in past years, and the advance in its sales in the current year, the fact that these shares stood at a price which yielded over 9% he could only regard as temporary. Miscellaneous investments, £26 174, to-day showed a depreciation of £10 000, but this also he hoped would prove to be only temporary. With regard to the revenue account, the bank interest was heavy, but this was due to the fact that the investment of £500 000 in Lissen, Ltd., was made early in December, 1928, from moneys borrowed from the bankers pending receipt of the calls due subsequently. The Board did not recommend the payment of a dividend on this occasion, as they felt that it was in the best interests of all to build up a strong financial position. He could, however, strike a hopeful note for the future by drawing attention to the fact that the gross annual revenue from their investments in the Lissen and Ever Ready companies on the present basis exceeded £50 000.

HYDE AND COWLEY, 94, Abbotsbury Road, Weymouth, electrical and wireless engineers. £23 3s. 8d. December 3rd.

JONES, A. S., 9, Newborough Street, Caernarvon, wireless dealer. £11 7s. 4d. December 3rd.

OWEN, J., 23, Church Street, Atherton, near Manchester, wireless dealer. £13 8s. 11d. December 3rd.

PEWCO ELECTRIC CO., 38, Broadway Parade, Crouch End, electrical and wireless engineers. £20 os. 8d. November 18th.

Bill of Sale.

BAWTREE, Donald Wells, Bendoran, Salisbury Court Road, Banstead, wireless dealer. Dated January 3rd, filed January 7th. £100.

Deeds of Arrangement.

GOLDSMAN, Jacob Louis, 100, High Holborn, W.C., radio engineer. Dated January 18th; filed January 20th. Trustee, R. Stephens, 31, Lombard Street, E.C. Liabilities unsecured, £1 782; assets, less secured claims, £780.

WILD, Eveline Hannah (wife of Hubert Wild), trading as C. B. PORTABLE RADIO CO., 117A, Abergele Road, Colwyn Bay, wireless apparatus dealer. Dated January 13th; filed January 14th. Trustee, A. Armstrong, 41, Corporation Street, Manchester, I.A. Liabilities unsecured, £649; assets, less secured claims, £250.

WILKINSON, Henry Orwin, 913, Brighton Road, Purley, wireless and electrical engineer and contractor. Dated January 16th; Filed January 20th. Trustee, C. Latham, 78, New Oxford Street, W.C. Secured creditors, £120; liabilities unsecured, £1 556; assets, less secured claims, £1 127.

Receivership.

BURGOYNE WIRELESS, LTD. G. Gore, of 33, Waverley Avenue, Wembley, was appointed receiver and manager on January 7th, 1930, under powers contained in debenture dated October 18th, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ANDERSON'S WIRELESS SALES AGENCY, LTD., 39, Farringdon Road, E.C. A meeting of the creditors was held on January 20th, Mr. Greenberg, the sole director of the company presiding. Mr. W. G. Dunn, of 11, Great Turnstile, High Holborn, W.C., who had been appointed the liquidator of the company, submitted a statement of affairs which disclosed liabilities of £1 903, all due to unsecured trade creditors, and total assets estimated to produce £1 855, less debentures and preferential creditors amounting to £1 190, or a deficiency of £1 238. It was stated that there might be a claim for royalties and income tax, but the amounts had not yet been ascertained. It appeared that the company took over the business from Mr. Greenberg, the vendor, in October, 1927, the purchase price of £1 000 being satisfied by the debenture for £1 000 on all the assets of the company. Mr. Greenberg was disposed to put aside the question of acting under his debenture, and preferred to make an offer to the creditors. After discussion he undertook to guarantee to the satisfaction of the committee of inspection a composition of 6s. 8d. in the £, payable as to 1s. 8d. in seven days 2s. 6d. on February 10th and 2s. 6d. on March 10th. Subject to the guarantee the creditors confirmed the liquidation with Mr. Dunn as liquidator, and appointed a committee of three creditors.

WILKINSON, H. O., electrical engineer, 913, Brighton Road, Purley, Surrey. A meeting of the creditors of the above was held recently, when it was reported that the liabilities were £629, made up as follows: Trade creditors, £339 8s. 3d.; rent, £150; and bank overdraft, £140. The assets comprised book debts, £368; tools, £50; and stock and plant, £754; making a total of £1 172, or a surplus of £543, subject to realisation. It was stated that proceedings had already been commenced by certain creditors, and in order to avoid an execution being levied, it was decided that a deed of assignment should be executed with Mr. C. Latham, accountant and auditor, 78, New Oxford Street, London, W.C., as trustee, together with a committee consisting of the representatives of Auto Sundries, Ltd., Falk, Stadelmann and Co., Ltd., and L.E.S Distributors.

London Gazette, etc.

Winding-up Petition.

GRAMOPHONE CABINETS.—A creditor's petition for winding up has been presented by A. E. Webster, trading as London Electrical Co., 1, Sherborne Lane, King William Street, London, electrical accessories dealer, and is to be heard at the Royal Courts of Justice, Strand, London, on January 27th.

Companies Winding-up Voluntarily.

ANDERSON'S WIRELESS SALES AGENCY, LTD.—By reason of its liabilities, January 10th. W. G. Dunn, chartered accountant, 11, Great Turnstile, High Holborn, W.C, appointed as liquidator.

DONARELLI PHONO-ELECTRON, LTD.—By special resolution, January 13th, H. H. Gay, 74, Cheapside, E.C., appointed as liquidator.

Bankruptcy Information.

IRVING, Richard John, 4, Bridge Road, Kirkstall, Leeds, trading as R. IRVING, wireless dealer. Receiving order, January 11th. Debtor's petition.

MORPHY, Donal William, 4 and 5, Dorset Mews, North Upper Gloucester Place, London, N.W.1, manufacturer of wireless apparatus. Receiving order, January 15th. Debtor's petition. First meeting, January 28th, 11 a.m., and public examination, March 7th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

QUINTRELL, William Henry, Higher East Street, St. Columb Major, Cornwall, electrical and mechanical engineer. First meeting, January 24th, 11 a.m., Official Receiver's Offices, 12, Princes Street, Truro. Public examination, February 3rd, 11.45 a.m., Town Hall, Truro.

Notice of Dividend.

SMITH, Boulton, trading as H. WORTON, The Crescent, Spalding, electrical engineer. First and final dividend, 1s. 4¼d. per £, payable January 27th, 4 and 6, West Street, Boston, Lincs.

Notices of Intended Dividends.

HUNT, Sydney Everest, 8A, Torwood Street, Torquay, electrical engineer and contractor. Last day for receiving proofs, January 31st. Trustee, E. H. Hawkins, 4, Charterhouse Square, London, E.C.1.

MILLWARD, Eric Rodney, trading as WEST OF ENGLAND RADIO, at 67, High Street, Barnstaple, wireless engineer. Last day for receiving proofs, February 1st. Trustee, W. R. COCKS, Exeter Bank Chambers, Broadgate, Exeter, Official Receiver.

WARNES, Elizabeth Ann (widow), 10, Crescent Gate, Wilmslow Road, Rusholme, Manchester, electrical and radio engineer, formerly trading as VICTORIA RADIO CO., but now as E. A. WARNES AND CO. Last day for receiving proofs, January 31st. Trustee, A. T. Eaves, 47, Mosley Street, Manchester.

Bankruptcy Proceedings.

HUDSON, Rex Chadwick, 1 and 2, Bridge Road, Chatburn, Lancs., electrical contractor. The public examination of this debtor was held last week at the County Court House, Victoria Street, Blackburn, when a statement of affairs was produced showing a deficiency of £2 024. The debtor attributed his failure to insufficient turnover and bad trade. It would seem that he commenced trading in September, 1922, but he was not successful. In November, 1925, he purchased eight houses in Bridge Road, at Chatburn, for £1 550, obtaining a mortgage of £690 from a building society, and borrowing £400 from a relative. Before completion he sold four of the houses for £1 010, and paid the balance of the purchase price out of the proceeds. In March, 1929, he obtained a mortgage of £600 from another building society, who paid off the original mortgage which had been reduced to £427. He had also borrowed money from various members of his family, but no claim had been made by his father and mother.

It was stated that the debtor had been employed as a subganger platelayer before entering business as a jeweller and electrical contractor. He admitted, in answer to the Official Receiver, that he had no previous experience in either trade, and that during practically the whole of 1929 he had sold stock at less than cost and had incurred a loss of about £11 per week. He had been heavily pressed by creditors.—The Official Receiver: Is not the real reason for your failure the fact that you are not competent in either trade? Debtor: Yes, there might be something in that.—The Official Receiver said that although he regarded debtor's answers as unsatisfactory, he did not think any useful purpose could be served by adjourning the examination.—The Registrar: I take the opposite view. It is desirous that this matter should be thrashed out publicly. This man starts business as a jeweller and electrician without the slightest possible experience. He has not the remotest idea of the value of stock and goes on trading with other people's money. He has carried on recklessly and has sold at less than cost goods which were obtained from creditors in the ordinary way of business. The hearing was adjourned.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by* GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.

ARGAPHOTO.—505 347. Class 13. Electric lamps and electric lighting fittings, all being metal goods not included in other classes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, Emmasingel 13d, Eindhoven; manufacturers. August 16th, 1929. (Date claimed under International Convention, May 8th, 1929.) To be associated with No. 463 335 (2 491).

STROMBO.—507 040. Class 13. Connecting sockets for electric lamps and the like. Archie Emanuel Howard, 5, High Holborn, London, W.C.1; merchant. October 18th, 1929.

AEONICLOCK. 505351. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy. Aeonic Radio, Ltd., 90, Regent Street, London, W.1; manufacturers.—August 16th, 1929. (By consent.)

STENODE. 507 503. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer.—November 5th, 1929. To be associated with No. 507628 (2700) and others.

VICEROY. 507538. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching, but not including gramophones, gramophone records and gramophone accessories. Carreras, Ltd., Arcadia Works, Hampstead Road, London, N.W.1; manufacturers.—November 6th, 1929.

STENODYNE. 507628. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer.—November 8th, 1929. To be Associated with No. 507503 (2700) and others.

STENOLITH. 507629. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. James Roginson, 76, Millway, Mill Hill, London, N.W.7; engineer.—November 8th, 1929. To be Associated with No. 507503 (2700) and others.

RADIOSTENODE. 507626. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer.—November 8th, 1929. To be associated with No. 507503 (2700) and others.

STENOSTAT.—507630. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer.—November 8th, 1929. To be associated with No. 507503 (2700) and others.

RADIOSTENOSTAT. 507627. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer.—November 8th, 1929. To be associated with No. 507626 (2700) and others.

PROXIMETER.—508215. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes, instruments and apparatus for teaching. Frederick Bateman and Co., Ltd., 43, Great Marlborough Street, Regent Street, London, W.1.; sight testing opticians.—November 27th, 1929.

DENSOR. 508236. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy. Arthur Preen and Co., Ltd., 22, Cricklewood Lane, London, N.W.2; manufacturers.—November 27th, 1929.

STENOPHONE.—507 502. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer. November 5th, 1929. To be associated with No. 507 503 (2 700) and others.

PIXIE.—508 097. Class 8. Sound reproducing apparatus and parts thereof, wireless telephonic apparatus and parts thereof, and wireless telephonic apparatus in combination with gramophones. Perophone, Ltd., 76–78, City Road, London, E.C.2; manufacturers. November 22nd, 1929. To be associated with No. 459 076 (2 468).

RADIOPATH.—507 625. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. James Robinson, 76, Millway, Mill Hill, London, N.W.7; engineer. November 8th, 1929.

DUBILIER (sign).—502 432. Class 8. Electric batteries (not for medical purposes). Dubilier Condenser Co. (1925), Ltd., Ducon Works, Victoria Road, North Acton, London, W.C; manufacturers. May 3rd, 1929. To be associated with Nos. 447 532 (2 435) and 458 873 (2 470).

SABUR.—503 845. Class 8. Accumulators and batteries for use in connection with wireless telephony. Joseph Aaron Isaacson, trading as The District Gramophone and Wireless Co., 323, Old Kent Road, and 107, Tower Bridge Road, London, S.E.1; gramophone and wireless dealer. June 21st, 1929. (By consent.)

ARMAFLEX.—507 608. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching, but not including photographic cameras, electric batteries and cells, or thermionic valves, and not including any goods of a like kind to any of these excluded goods. John Neale, 25, Craven Street, London, W.C.2; civil engineer. November 8th, 1929.

LEWBESTITE.—507 687. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. The London Electric Wire Co. and Smiths, Ltd., 7, Playhouse Yard, Golden Lane, London, E.C.1; manufacturers. November 11th, 1929. To be associated with No. 442 591 (2 391) and others.

RECORDION (sign).—507 769. Class 8. Instruments consisting of a combination of a gramophone with a radio receiving set. Radio Recordion, Ltd., 16, Lisle Street, Newcastle-upon-Tyne; manufacturers of combined wireless and gramophone sets. November 13th, 1929.

INO.—507 779. Class 8. Instruments and apparatus for use in wireless telephony, but not including electric batteries. Gas Light Fittings Co., Ltd., 322, Walworth Road, London, S.E.17; merchants.—November 13th, 1929. To be associated with No. 494 478 (2 662).

GOVERNMENT PUBLICATIONS.

The following publications have been issued by H.M. Stationery Office, London, etc.:—

South-West England and South Wales Electricity Scheme, 1929. 1s. 6d.
Do. Supplementary Particulars. 3s. 6d.
National Physical Laboratory: Collected Researches. Vol. XXI, 1929:—
II–IV. Three Papers on Mutual Inductance Standards. 2s.
V and VI. Note on Shielded Non-Inductive Resistances; also a General Theorem on Screened Impedances. 2s.
VII and VIII. A Method of Measuring Very Small Capacities with a Note on the Capacities of Small Air Condensers; also the Input Impedances of Thermionic Valves at Low Frequencies, 1s. 9d.
IX and X. The Piezo-Electric Quarti Resonator and its Equivalent Electrical Circuit; also Improved Cathode-Ray Tube Method for the Harmonic Comparison of Frequencies. 3s. 6d.
XI and XII. The Measurement of the Inductances of Four-Terminal Resistance Standards; also a Contact Theory of Dielectric Absorption and Power Losses. 2s.
XIII. A Magnetometer for the Measurement of the Earth's Vertical Magnetic Intensity in C.G.S. Measure. 1s. 3d.
XIV. The Power Losses in Magnetic Sheet Material in High Flux Densities. 2s.
XV, XVI and XVII. Three Papers on the Investigation of Wireless Waves Arriving from the Upper Atmosphere. 3s.
XVIII and XIX. The Cause and Elimination of Night Errors in Radio Direction-Finding; also the Attenuation of Wireless Waves due to the Resistance of the Earth. 1s. 6d.
XX and XXI. The Propagation of Radio Waves; also the Polarisation of Radio Waves. 2s.
General Post Office: Engineering Department: Technical Instructions: XXV. Automatic Telephone Exchange Systems:—Part 5. Siemens' No. 16 System (Provisional Issue). Diagrams. December, 1929. 1s.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

320 443 D. MONTAGUE and S. MONTAGUE. Wireless receiving apparatus. (31/7/28.)
295 386 SIEMENS-SCHUCKERTWERKE AKT.-GES. Electric distributing systems with duplicate bus-bars. (12/8/27.)
320 455 GENERAL ELECTRIC CO., LTD., N. M. HILL and W. WILSON. Electric power plant for running-in fluid-pressure engines. (16/8/28.)
320 460 A. H. WHITELEY. Wireless valve-holders, coil-holders and the like. (21/8/28.)
305 644 E. BODER. Electric switching systems controlled by timing apparatus. (10/2/28.)
299 390 SIEMENS-SCHUCKERTWERKE AKT.-GES. Means for controlling electrical fault indicating and protective devices. (25/10/27.)
307 735 SIEMENS-SCHUCKERTWERKE AKT.-GES. Means for controlling electrical fault indicating and protective devices. (12/3/28.)
297 801 WAYGOOD-OTIS, LTD. Elevator system. (28/9/27.)
320 511 C. W. DENNY. Electric illuminated advertising and display devices. (28/9/28.)
301 377 SIEMENS-REINIGER-VEIFA GES. FUR MEDIZINISCHE TECHNIK. Method of and apparatus for X-ray investigation. (28/11/27.)
320 526 G. HANEKOP and W. SCHMIDT. Electrolyte for galvanic elements or cells. (15/10/28.)
299 314 SIEMENS-SCHUCKERTWERKE AKT.-GES. Connecting means for electric conductors of aluminium or aluminium alloy. (22/10/27.)
320 537 G. W. BROWN. Illuminated signs. (29/10/28.)
320 540 A. E. O'DELL (SIEMENS-REINIGER-VEIFA GES. FUR MEDIZINISCHE TECKNIK). Method of and apparatus for taking X-ray photographs with a short exposure. (29/10/28.)
302 891 I.G. FARBENINDUSTRIE AKT.-GES. Protecting carbon electrodes from consumption in the atmosphere. (23/12/27.)
300 179 BRITISH THOMSON-HOUSTON CO., LTD. Methods of colouring glassware. (7/11/27.)
300 647 SIEMENS-SCHUCKERTWERKE AKT.-GES. Quick-acting switches for heavy currents. (17/11/27.)
320 551 L. F. GARDNER (BING WERKE VORM. GEB. BING AKT.-GES.). Holder for electric lamps for use in projection apparatus. (14/11/28.)
300 920 FELTEN AND GUILLEAUME CARLSWERKE AKT.-GES. Electric cables. (19/11/27.)
320 555 H. H. BERRY. Electric fires or radiators. (23/11/28.)
303 881 FELTEN AND GUILLEAUME CARLSWERK AKT.-GES. Electric cables. (12/1/28.)
320 563 F. G. BAUM. Dynamo-electric machines. (1/12/28.)
301 915 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Induction-type electricity meters. (9/12/27.)
301 935 COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATERIEL D'USINES A GAZ. Meters for the charge and discharge of electric accumulators and the like secondary batteries. (8/12/27.)
320 566 GENERAL ELECTRIC CO., LTD., and L. GRAF. Conveying apparatus. (13/12/28.)
311 313 AKT.-GES. BROWN BOVERI, ET CIE. Electric insulators. (9/5/28.)
320 588 MAXLUME LIGHTING AND HEATING CO., LTD., and F. W. THORPE. Globe-supporting galleries of electric and gas lighting fittings. (28/1/29.)
307 358 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Electric remote control systems. (3/8/27.)
307 760 ALLOY WELDING PROCESSES, LTD. Electrodes for electric arc welding or soldering. (12/3/28.)
320 596 ALLOY WELDING PROCESSES, LTD., and E. J. CLARKE. Electrodes for electric arc welding or soldering. (13/3/29.)
320 330 W. H. SCOTT, G. J. SCOTT and H. D. WHEELER. Braking of electric winches or the like lifting and lowering apparatus. (4/7/28.)
320 639 J. L. BAIRD and TELEVISION, LTD. Synchronising devices for television and like systems. (16/4/28.)
289 401 M. URBINATI. Devices for the commutation in the transformers of electric alternate currents into direct currents and vice versa. (26/4/27.)
320 654 G. R. SEARLE. Loud speakers for wireless apparatus or the like. (21/4/28.)
289 439 A. BLONDEL. Systems for the electrical transmission of synchronous movement. (27/4/27.)
302 882 CUTLER-HAMMER MANUFACTURING CO. Control means for electric motor-driven devices. (23/12/27.)
293 299 SCHMID-PATENT CORPORATION. Electric batteries. (2/7/27.)
320 615 BROOKHIRST SWITCHGEAR, LTD., and J. A. HIRST. Method of and apparatus for starting and controlling electric motors. (16/6/28.)
292 172 INTERNATIONAL GENERAL ELECTRIC CO., INC. Dynamo-electric machines. (16/6/27.)
292 509 BRITISH THOMSON-HOUSTON CO., LTD. Construction of stators of dynamo-electric machines. (20/6/27.)
320 605 L. ADAM. Automatic telephone system. (9/7/28.)
320 634 GENERAL ELECTRIC CO., LTD., A. E. ANGOLD, and F. BARRELL. Automatic control of electrical apparatus. (16/7/28.)
320 622 W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., and W. H. NICHOLS. Electric cut-outs. (16/7/28.)
320 624 E. GERARD. Emergency supply arrangements for working plants supplied with electric energy. (16/7/28.)
320 647 F. W. LANCHESTER. Moving-coil loud-speakers. (18/7/28.)
320 652 C. S. FRANKLIN. High-frequency feeders and the like for use with radio aerial systems. (18/7/28.)
320 662 G. D. POWELL. Apparatus for the electrical reproduction of gramophone or like records. (19/7/28.)
294 606 TRICO PRODUCTS CORPORATION. Antenna. (27/7/27.)
294 257 L. THURM. Optical system for radio kinematographic transmitting and receiving apparatus. (21/7/27.)
320 670 J. LUCAS, LTD., and O. LUCAS. Motor vehicle electric headlights. (20/7/28.)
320 671 O. FULTON. Systems for the electrical transmission and reception of pictures, diagrams or other representations. (20/7/28.)
320 673 O. FULTON. Process for the control of electric current impulses for the purpose of remote picture transmission or of television or the like. (20/7/28.)
320 676 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Vibration-damping devices. (20/7/28.)
320 677 H. R. SETRIGHT. Indicating apparatus for use with totalisators. (20/7/28.)
320 700 HOTPOINT ELECTRIC APPLIANCE CO., LTD., and W. J. SIMS. Electric boiling plates and the like. (26/7/28.)
294 659 SIEMENS AND HALSKE AKT.-GES. Apparatus for indicating the direction of travel of a train.

Applications for Patents.

October 4th.

30 136 ELECTRICAL RESEARCH PRODUCTS, INC. Loading conductors. (6/11/28, U.S.)
30 137 ELECTRICAL RESEARCH PRODUCTS, INC. Submarine cable systems. (31/5/29, U.S.)
30 138 ELECTRICAL RESEARCH PRODUCTS, INC. Television systems. (21/12/28, U.S.)
30 119 ELECTRO-MECHANICAL BRAKE CO., LTD., and S. SMITH. Automatic control devices for air compressors.
30 167 M. E. ELLIOTT. Electric amplifying systems.
30 083 HARRIS AND SHELDON, LTD., and R. G. TURNER. Electric switches for motor vehicles, etc.

30 755 Graham Ampion, Ltd., A. D'A. Hodgson. Transformers.
30 738 H. T. Harrison. Light reflecting bodies.
30 750 Kolster-Brandes, Ltd. (Kolster Radio Corporation). Automatic remote-control radio set.
30 765 J. E. G. Lahousse. Insulating material for electric condensers, etc. (22/10/28, France.)
30 812 J. C. Laurent. Electric winding of timepieces. (16/10/28, France.)
30 806 Siemens Schuckertwerke Akt.-Ges. Lead sheathed cables. (13/10/28, Germany.)
30 816 Siemens Schuckertwerke Akt.-Ges. Centrifugal condensers. (10/10/28, Germany.)
30 817 Siemens und Halske Akt.-Ges. Metal vapour arc lamps. (11/10/28, Germany.)
30 801 Telefunken Ges. für Drahtlose Telegraphie. Signalling by modulated energy. (31/10/28, Germany.)
30 820 Victor Talking Machine Co. Thermionic valve amplifying systems. (10/10/28, U.S.)
30 777 Westinghouse Electric and Manufacturing Co. Safety apparatus for elevators, etc. (10/10/28, U.S.)

October 11th.

30 936 Automatic Telephone Manufacturing Co., Ltd. Telephone instruments
30 937 Automatic Telephone Manufacturing Co., Ltd., and W. H. Paulett. Electrical Indicating devices, etc.
30 939 Automatic Telephone Manufacturing Co., Ltd., and H. Jackson. Automatic switches for telephone systems, etc.
30 842 T. Batchelor, A. B. Smith, and Wandsworth Electrical Manufacturing Co., Ltd. Electric switches.
30 961 A. T. Beaumont. Electric pedestrian signals.
30 944 R. W. Blades, J. H. Roberts and J. F. Watson. Electric bonding devices.
30 850 30 851 W. Bullen. Wireless signalling apparatus.
30 913 Burgess Battery Co. Battery hand lamps. (16/10/28, U.S.)
30 881 J. P. D. Coleman and Wild-Barfield Electric Furnaces, Ltd. Electric furnaces.
30 857 M. von Devecis and Waldberg Soc. Anon. Galvanising or electric plating processes.
30 853 A. F. de Fraine. Wave trap for wireless receiving sets.
30 919 H. C. Heide (Motor Meter Gauge and Equipment Corporation). Electric measuring instrument.

COMING EVENTS.

Friday, January 24th.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Paper by Miss W. A. Leyshon on "Characteristic of Discharge Tubes under 'Flashing' Conditions, as Determined by the Use of a Cathode Ray Oscillograph." 5 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre Students' Section).—Armstrong College, Newcastle-upon-Tyne. The Students' Lecture, "Electric Traction," by Lt.-Col. H. E. O'Brien. 7.15 *p.m.*

Monday, January 27th.

Electrical Contractors' Association (Ealing Sub-Branch).—Ordinary meeting.

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Discussion on "High-Tension Distribution." Opened by Mr. G. V. Twiss. 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-upon-Tyne. Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched Arc Switch." 7 *p.m.*

Tuesday, January 28th.

Electrical Contractors' Association (Chesterfield Sub-Branch).—Falcon Café. Ordinary meeting.

Institution of Electrical Engineers (Students' Section of the North-Western Centre).—Engineers' Club, Albert Square, Manchester. Informal discussion on "Illumination, Domestic Appliances and Industrial Heating." 7.15 *p.m.*

Institution of Electrical Engineers (South Midland Students' Section).—Afternoon visit to Messrs. Metropolitan Cammell Carriage, Wagon and Finance Co., Ltd., Saltley, Birmingham.

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. Paper on "Changing D.C. Networks to A.C." 7.15 *p.m.*

Institution of Electrical Engineers (North Midland Students' Section).—Hotel Metropole, Leeds. The Students' Lecture, by Lt.-Col. H. E. O'Brien, on "Electric Traction. 7.15 *p.m.*

Wednesday, January 29th.

Electrical Contractors' Association (Croydon Branch).—Ordinary meeting.

Electrical Contractors' Association (Belfast Branch).—5, Bedford Street. Ordinary meeting. 3.30 *p.m.*

Institution of Electrical Engineers (South Midland Centre).—Midland Institute, Birmingham. Joint meeting with the Midland Centres of the Institutions of Civil and Mechanical Engineers. Faraday lecture, by Capt. P. P. Eckersley, on "Broadcasting by Electric Waves." 7 *p.m.*

Thursday, January 30th.

Institution of Welding Engineers.—Chamber of Commerce, 95, New Street-Birmingham. Paper by Mr. C. A. Hadley on "Modern Improvements in Electric Resistance Welding Machines." 7 *p.m.*

Friday, January 31st.

Institution of Electrical Engineers (North-Eastern Students' Section).—Armstrong College, Newcastle-upon-Tyne. Joint meeting with the Graduates of the North-East Coast Institution of Engineers and Shipbuilders. Paper by Mr. W. G. Thomson on "The Electrical Propulsion of Ships." 7.15 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster, London, S.W. Informal meeting. Paper by Mr. F. Onions on "Superheating." 7.30 *p.m.*

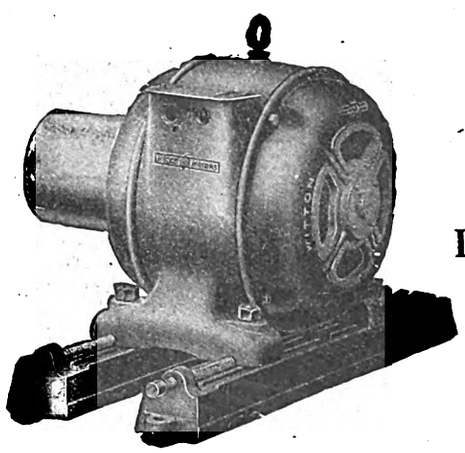
PROPRIETOR WALTER F. HIGGS, M.I.E.E.

WITTON BIRMINGHAM

A.C. D.C.



We have developed a new line of totally enclosed induction motors in the smaller frames, at prices little in advance of protected machines. This has been accomplished by specially designing the motors for totally enclosed working. They are not protected machines with totally enclosed covers fitted, nor is there an external fan and casing fitted to get filled with dirt etc., but just straight T.E. machines, and as robust as it is possible to make motors.

Overhead Lines.

THIS week's issue is the third of our annual Overhead Lines Numbers. Material progress has taken place regarding the development of overhead networks since the first number was in preparation, and the fact that both the two previous numbers were sold out almost immediately after publication showed that they were appreciated. This year's number will, we think, be found of at least equal interest. Among its special features are notes on practice at home and abroad; some people are so insular that they think it almost unpatriotic to discuss what is going on elsewhere. Yet in some countries power transmission worthy of the name and rural distribution began about 40 years ago, whereas only during the last decade has material progress taken place in the same direction with us. We were the first country to develop such world benefits as steamships, railways, textile machinery, engineers' machine tools, and Portland cement, and FARADAY was one of us; if our engineers and business men had not been fettered by dog-in-the-manger legislation and other artificial obstacles, we might have been leaders in aerial high tension work as well. There is nothing *infra dig.* in studying what other people are doing; they may be right or may be wrong, but even their faults convey a lesson. In overhead line work many engineers are doing to-day what others have done years ago, similar circumstances having led to the adoption of familiar methods or remedies.

Insulators.

SOME worthy people shudder at the very idea of controversies technical or social. In engineering matters experts frequently differ, the discussion of differences opens the door to progress; that is one of the reasons why we have given prominence to the views of Professor VELLANDRE, of Stockholm, on the subject of porcelain insulators. Regarding specifications, the ideal is to obtain the correct balance, otherwise one may be robbing Peter to pay Paul when going too far in one direction. There have been acute differences regarding the desirability of existing tests under oil. A great deal of attention has been given undoubtedly to electrical tests of porcelain insulators, and mechanical tests have never received the attention they should have had. Up to date vitreous insulators hold the field for high tension lines; what is badly wanted is a high grade insulating material which can be relied upon to stand heavy tensile stresses, something non-fragile, inorganic regarding composition, something which can be moulded without fear of carbonisation which will stand material sectional temperature variations and will resist damage due to salt spray. It is difficult, however, to imagine something which will stand up to a bad arc with vast power behind it.

Line Supports.

WE have by no means reached finality regarding line supports. Wood is getting dearer, and eventually it rots; steel is handy, but in time it rusts; concrete when well made lasts indefinitely, but, unless it is carefully designed and made, the advantages may be killed by excessive weight and transport costs. Centrifugal concrete certainly looks neat, and so do some cast posts. They make an appeal, as compared with lattice work, to lovers of rural amenities.

Conductors.

MUCH progress has taken place in the use of aluminium-steel for h.t. conductors. Owing to its large diameter and therefore the extra transverse stresses to be allowed for as compared with copper or copper alloys it is not so attractive for light rural lines as for feeders or transmission mains. It will be interesting to see whether high tensile aluminium alloys have come to stay—they have been used for some years in Switzerland and recently in Italy on trunk transmission lines. On the long span rural lines at home their light weight may stand in the way of their use, owing to whipping under longitudinal wind gusts.

Digitized by Google

Several British makers now seem to be tackling other forms of conductor, cadmium, copper, and copper-clad steel; some improvements have taken place regarding galvanising which should make stranded steel galvanised conductors more popular where tensile strength is more important than amperes. The developments taking place abroad to obtain flexible large-diameter conductors to minimise corona losses at the highest commercial voltages are mechanically and electrically interesting.

Test of the Storms.

IN recent months this country, and some others as well, have been visited by a series of exceptionally heavy storms. Although chimney pots and elm trees have been tumbling down, and chicken houses and garage roofs have been waltzing over hedges, enquiries made in all parts of the country indicate that overhead power lines have been behaving most sedately. Most of the little trouble that has occurred has been due to unauthorised trespassing bodies, from branches of trees to chunks of hay ricks, which have been wandering around in the air, causing some strain on the vocabularies of those in charge of circuit breakers.

Kites and Overhead Mains.

WHEN BENJAMIN FRANKLIN drew lightning from the skies by means of his kite, he probably had no inkling that an American youth a century and a half later would meet his death by unwittingly tapping with his kite string harnessed energy of the kind which FRANKLIN'S experiments helped to reveal to man. The Iowa Supreme Court has recently decided that the electricity supply company concerned was not liable for the electrocution of a boy nine years old who was flying a kite with a copper string which came into contact with a power line. The Court ruled that, although those who maintain dangerous agencies must be held to a high degree of care and that rigid supervision is required to ensure that the danger does not threaten others or constitute an "attractive nuisance" to children, there must also be supervision of the children. The moral is that children should be taught something about electric power lines and instructed as to the nature of conductors and insulators. Now that a great extension of overhead h.t. mains is taking place in this country, it is desirable that elementary education should take cognisance of the fact and endeavour to prevent a repetition of the Iowa tragedy on this side of the Atlantic.

The Hatry Sentences.

WITH the conclusion of the Hatry trial we may hope that this sordid and disgraceful affair, which has hung like a poisonous fog over the financial life of the country for the past six months, is entering on its last phases. There is still plenty to do in clearing up the mess, and it will be a long time before the severe blows dealt, not only at private credit, but at that much more vital thing, the credit of the City of London, fade from memory. It is difficult to understand the mentality of those who are speaking of the sentences passed on Hatry and his associates as unduly severe—apparently on the ground that their victims were mainly banks and wealthy individuals or concerns, or because no evidence could be produced that any of the gains from these fraudulent transactions had been permanently annexed by the guilty individuals. Any common bank robber who lives up to his income is equally deserving of sympathy on such pleas. Those who lightly accept them not only forget the thousands of ratepayers who have been victimised, but show a deplorable lack of understanding of the wider aspects of the affair. The weakening of public confidence in the security of investments hitherto regarded as in the gilt-edged class is a blow at national credit and prosperity for which no conceivable legal penalty could be too strong. Only those who desire to see all foundations weakened in order to further their own subversive policies, or the unthinking individuals who are the tools of the actively malevolent and form one of the chief dangers which threaten democracy, will join in regarding lightly a series of frauds which have done greater damage to our reputation for financial morality than anything that has happened in living memory. One other point deserves public attention. One hesitates to advocate any fresh legislation at a time when Parliament could be more usefully employed in repealing superfluous and obsolete laws, but we should not be sorry to see a short Bill introduced to make it impossible for convicted criminals to sell their pens to newspapers for sums equivalent to many years' earnings of writers who have not qualified for the highest scale of remuneration by going to gaol for some offence of the first magnitude.

Government Policy.

ON another page we print Sir JOHN CORCORAN'S letter on the effect of Government policy on British trade, a subject to which we have already given some attention. There is no doubt that the atmosphere of uncertainty which now exists in regard to taxation, the increase of doles, the price of fuel and the future of certain duties is having a very detrimental effect. When to this uncertainty is added the shock to credit resulting from the Hatry affair and other difficulties which have occurred in the City during the past few months, it is no wonder that unemployment has mounted to the 1 500 000 level. The electricity supply undertakings are beginning to take an active interest in the effect of the Coal Mines Bill on their fuel costs, and the letter from Mr. W. B. WOODHOUSE draws attention to a serious aspect of the matter. In the case of one of the medium sized undertakings in the Home Counties it has been calculated that an increase of 4s. a ton in the price of coal will add a substantial fraction of a penny per unit to the generating cost. If increasing the cost of electricity, gas and solid fuel to industry and to the 40 000 000 inhabitants of the island who are not engaged in coal mining or dependents of miners in order that the miners may work half an hour a day less is the Government's idea of promoting the national well-being, we are indeed living in a topsy-turvy world.

The Jubilee Dinner.

TO-MORROW night's Jubilee Dinner of the firm of BENN BROTHERS, LTD., at the Wharncliffe Rooms, promises to be a notable gathering. Sir ERNEST BENN will take the chair and a company of 450 will sit down. The speakers will include Sir WILLIAM PLENDER, Mr. WALTER RUNCIMAN, M.P., and the DEAN OF ST PAUL'S. The Right Hon J. H. THOMAS, M.P., Lord Privy Seal, will be the guest of honour, and among the other guests at the top table will be Mr. ARNOLD BENNETT, Mr. R. D. BLUMENFELD, LORD HAMBLEDEN, LORD CHARNWOOD, Mr. WEDGWOOD BENN, M.P., Secretary of State for India, and several Ministers of foreign States.

PROGRESS OF THE GRID.

Over 800 Miles to be Built by End of 1930—Contracts Worth £11 000 000 Already Placed—Greenock-Bonnybridge Main Completed—Supply of Rural Areas—Nation-Wide Effort Needed to Ensure Success.

UP to the end of December last nearly 60 miles of the 132 000 V lines which are to form the grid system had been completed. Progress during 1930 will be much more rapid for it is estimated that well over 800 miles of 132 000 V route will have been built by the end of this year and the value of the contracts already placed by the Central Electricity Board exceeds £11 000 000.

The six schemes which have already been authorised will have a total mileage of nearly 2 000. This month the South West England and South Wales scheme (739 miles) was published; so that when the latter scheme has been authorised a total mileage of over 2 700 will have been sanctioned. There remain East Anglia (Norfolk and Suffolk) for which a scheme is in preparation (possibly this area will be added to South East England), North Scotland and South Scotland to complete the whole of Great Britain. Some progress has been made in South Scotland but consideration of the sparsely inhabited North Scotland region is likely to be deferred for the present.

Of the work to be carried out during 1930 the greater part will be in Central Scotland and South East England in both of which areas transmission lines to the extent of about 250 miles will be constructed this year. By the end of December next the Central Scotland scheme will be completed and more than half the total contemplated mileage in South East England will have been built. In Central England over 150 miles and in the North West England and Mid East England areas another 150 miles or so, divided fairly equally between the two, are due for completion this year. The contractors are keeping well up to schedule although the exceptionally wet weather of the past four months has naturally made across country work very difficult in many parts of the country.

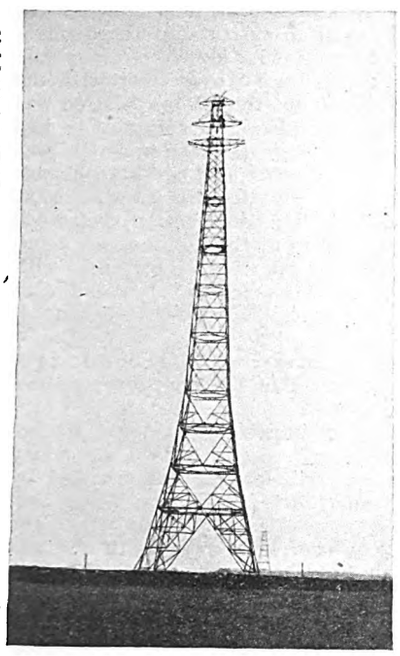

Fig. 1.—338 ft. tower at the Forth crossing—3 050 ft. span.

The principal main 132 000 V line that has been completed extends from Greenock via Glasgow to Bonnybridge. It includes several high river crossings, that at Yoker over the Clyde and the Cart crossing requiring the provision of high towers to carry the cables above the vessels which use these rivers. The towers at the Forth crossing, on the extension from Bonnybridge towards Dundee, are 338 ft., the crossing span being 3050 ft. with a clearance of 100 ft. above river level. The Clyde towers are 270ft. high and those over the Cart are 238 ft.

Other sections in use are the secondary line from Stockport to Macclesfield and a short section of 132 000 V line in Bedfordshire which is temporarily employed to carry a lower voltage.

While construction is making good headway, the effects of which will be much more apparent to the eye in a few months time than they are to-day, the basic problem of connecting the less densely populated rural areas to the grid has still to be solved. The country has embarked on an undertaking the magnitude of which very few people realise, but merely to cover the country with thousands of miles of h.t. transmission lines connecting up generating stations and serving towns which are already obtaining electricity at reasonable rates is far from being all that is needed to ensure the success of the grid. For it is necessary that it should not only be technically successful but that it should realise the full purpose with which it was conceived. To achieve this it must enable consumers in small towns and villages and on farms to obtain cheap power. It will not pay anyone to attempt to supply such rural and semi-rural areas except as part of a larger district which includes towns of some size. In the first place urban undertakings must be induced to spread their distribution network as widely as possible into surrounding territory and nurse the rural demand for a time, until they have succeeded in attracting as many consumers as possible to their mains. In the end they will undoubtedly reap the reward of a far-sighted policy. Without a general realisation of the importance of courageous development on these lines the grid cannot do what its sponsors hope that it will do in the direction of rural electrification, Failure would react on the urban classes of consumer in the long run, so that it is in the real interests of those classes that they should be willing to postpone a portion of the benefit that they may expect to reap from a cheapening of the cost of current in order to assist in widening the circle of consumption to embrace neighbouring rural areas.

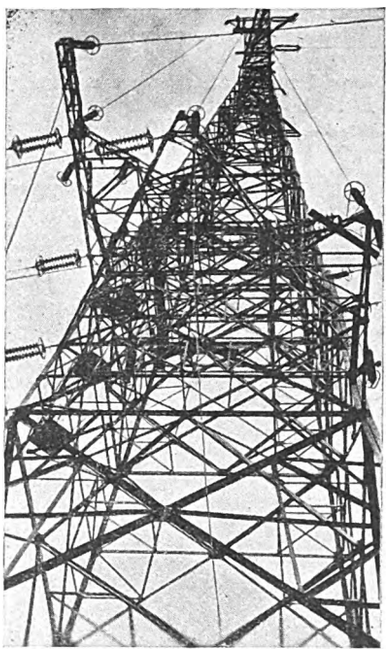

Fig. 2.—View of one of the Clyde crossing towers, Yoker, taken from the base.

There is not too much time left in which to work out a practical scheme of supply in rural districts. The grid is daily extending itself and in a comparatively short time its great conductors will link up all the populous parts of the island. But arteries are useless without an efficient and universal capillary system. Provision of that network is the urgent task that must now be taken in hand. National prestige as well as a large amount of capital is at stake and a nation wide effort is required to bring the undertaking to full fruition.

G. H. L.

OVERHEAD LINES.

A recent publication of the British Engineering Standards Association is Specification No. 215–1930 dealing with aluminium and steel-cored aluminium conductors for overhead lines. This is a revision of the 1925 edition and differs from its predecessor mainly in that the value of the resistivity has been slightly altered in order to conform to the value recently adopted by the International Electrotechnical Commission; the tables given in the Specification have been recalculated in accordance with the new value of the resistivity. Provision has also been made for certain of the mechanical tests to be carried out both before and after stranding. Slight modifications have also been made in the galvanising test.

ISSUE OF £7 000 000.

The second issue of stock of the Central Electricity Board, to the amount of £7 000 000 in 5 per cent. stock at 97½ was offered for subscription last Saturday. The first issue (£3 000 000 of 4 per cent. stock, now quoted at about 80) was made last summer. The Board has power to borrow up to £33 500 000 and the Electricity Commissioners have now given consents in respect of £17 900 000 (£5 400 000 for standardisation of frequency and £12 500 000 for construction and acquisition of main transmission lines, etc.).

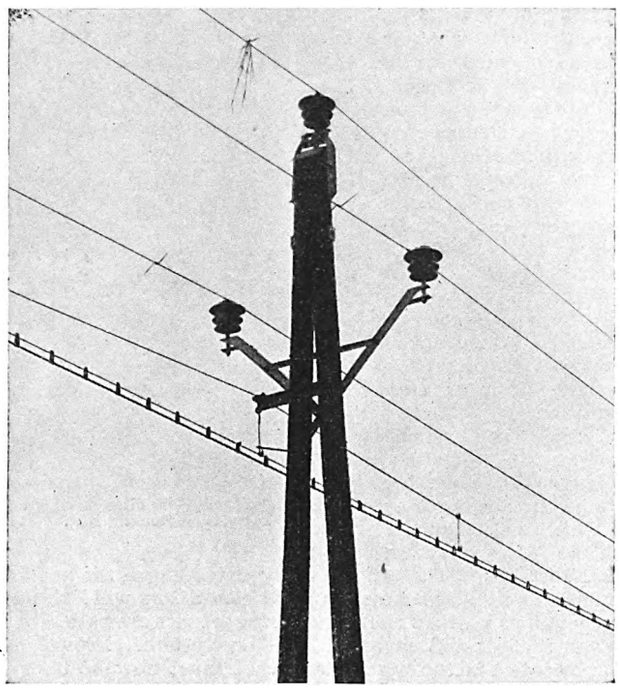
OVERHEAD LINES IN THE STORMS.

Little Trouble Experienced—Satisfactory Behaviour During Exceptionally Bad Weather—Danger from Falling Elms—Advantage of Weak-necked Insulators.

IN view of the exceptionally stormy weather of the past few months and the severe testing to which overhead transmission lines have been exposed, we asked a number of chief engineers of power companies in all parts of the island to send us particulars of the behaviour of their overhead routes during the gales of the autumn and winter. Their replies for the most part may be summarised by the phrase "nothing of special interest to report"—negative testimony which is a remarkable tribute to the strength and reliability of the British overhead line systems. We give below extracts from some of the replies received, which are not purely negative in character :—

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Nothing of interest to report other than confirmation of our previous experience that, whereas a certain amount of pole settlement is to be expected on the more recently erected lines, those on which the ground has become thoroughly consolidated are



Straw guards used by the North Metropolitan E.P.S. Coy.

practically free from pole settlement. Trouble has been experienced through straw blowing along the line wires and bridging across the pin insulators, but this has been effectively met by the fitting of straw guards as shown on the photograph. These consist of a single strand of 8-gauge wire made off round the line wire about 2 ft. 6 in. from the line insulators and projecting 4 to 5 inches. The guards are usually fitted only in the vicinity of straw or haystacks, and on the southerly or westerly side of the pole, no trouble being experienced through other than south-west winds.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—The main transmission lines of this undertaking consist of 66 000 and 33 000 V net work with 11 000 V intermediate lines of an approximate length within the neighbourhood of 250 miles. From these, two hundred or so l.t. overhead village distributions are supplied. During the period of November, December and up to time of writing the Anemo Biagraph at our central control registered the following maximum wind speeds: November 11th, 64 miles per hour; December 6th, 68 miles per hour; December 12th, 62 miles per hour. Directions of wind mainly south-westerly. Although supports on various sections of lines were flooded up to a depth of 5 ft. there is no instance on either e.h.t. transmission lines or l.t. distribution lines where trouble occurred due to constructional collapse under adverse conditions. It is the standard practice of this undertaking to fit foundation baulks on all single pole e.h.t. lines and this has undoubtedly assisted materially in preventing damage to the many miles of 11 000 V lines within our area. The only trouble has been due to dead branches of trees.

In the case of the 33 000 V line running between Gloucester and Cheltenham, it was decided, on account of the possibility of salt deposit, to insert an extra insulator disc, and insulation on this line gave no trouble whatever.

MID-CHESHIRE ELECTRICITY SUPPLY CO.—Our overhead system—consisting of 25 miles of 33 000 V lines, and perhaps twice that quantity of lower voltage lines—has so far stood up without any mishap. The only trippings which we have had during the windy weather have been due to a shunting ribbon on a 33 000 V isolating switch becoming detached from the other laminations and making an occasional earth on to an insulator spindle. This shows the importance of having woven flexibles instead of flat strip laminations or even straight flexible shunting wires. It would be interesting to know if low pressure lines put up since the spring of 1928 to the lower factor of safety allowed by the Electricity Commissioners have given any trouble.

TAUNTON CORPORATION ELECTRICITY DEPARTMENT.—We have had no serious trouble with our overhead lines during the recent heavy gales. In one case the bough of a tree caused a short circuit on a low tension distributor but did not bring it down. A 7/12 S.W.G. galvanised steel e.h.t. line with spans of 400 ft. in a very exposed position gave no trouble whatever.

TORQUAY ELECTRICITY DEPARTMENT.—No great or extensive damage was experienced. The weather has been such that by the perpetual rain and intermittent wind storms, it gave any structures a very severe test, inasmuch as the foundations were soaked to such an extent that the bending moment reaction was considerably reduced. About one mile of one of our main transmission lines "went over with the wind" to an angle of 60 degrees, but the job in question was comparatively new, having been placed in commission last July. Therefore, the pole-hole reinstatement, which was replaced during the dry summer weather, had had little chance of getting firmly "bedded in." This feature shows the inherent weakness in a single pole line construction, inasmuch as all the factors under the control of the designer are more than able to withstand a wind storm up to 100 m.p.h. with perfect confidence, but the ground reaction is incapable of standing up to the stress unless special care is taken in respect to the foundations.

We on the south-west coast were exposed to the full force of the various storms, with the result of finding another weakness—the elm tree, which is very common in Devonshire.

The foregoing is the result of inquiries in respect to two separate incidents experienced with regard to two secondary lines. In both cases, the transmission was interrupted by elm trees having been uprooted and falling across the line, which brings out another important point in respect to the layout of a job near elm trees—i.e., keep away from them at least a tree and a half length, because sooner or later they will come down and cause trouble. When the trees came through the lines the porcelain insulators merely snapped off at the neck and liberated the line, with the result that the line poles were little affected. It seems desirable that this should be a feature of insulator design, and a weak-necked insulator should be fitted where there is any likelihood of trees being blown down across lines—i.e., actually design the insulators to break off at the neck when the lateral stress is greater than the prescribed legal standard.

AYRSHIRE ELECTRICITY BOARD.—In this district we have had gales continuously for the last two months, but as far as the velocity of the wind is concerned we have had no breakdowns. We have had trouble, however, on a particular transmission line which runs along the coast, due to the wind blowing the sea salt on to our insulators and causing them to flash over. Although these lines are working at a pressure of 11 000 V the insulators are designed for 25 000 V. In addition to gales we have had rather severe lightning and on a number of occasions the lightning has struck our transmission lines, causing our automatic switches to operate. Our experience is that lightning occurring in the winter is very much more severe than that occurring in the summer.

OVERHEAD LINES AND RURAL AMENITIES.

A Valuable Discussion—Importance of Early Collaboration in Selection of Routes—Colours of Insulators—Screens of Trees Suggested.

ON January 15th, at the Institution of Electrical Engineers, a joint discussion took place between the Overhead Lines Association and the Councils for the Preservation of Rural England and Wales on the subject of the distribution of electricity in rural areas and the preservation of the amenities of the countryside. On December 15th last, the Councils for the Preservation of Rural England and Wales placed a report on this subject before the Ministry of Transport, and some reference was made to this report during the discussion.

Mr. Theodore Stevens (President, Overhead Lines Association), who was in the chair, opened the discussion with a general statement of the circumstances which led to the formation of the Overhead Lines Association, and emphasised the point that its objects are to develop the distribution in rural areas on economical lines, at the same time co-operating, to the fullest extent, in preserving the amenities of the country.

Mr. Stevens, in asking the representatives of the Councils for the Preservation of Rural England and Wales and others interested in amenities to state their case fully and frankly, said the object was to consider how it was possible to crystallise the hope expressed in THE ELECTRICIAN of January 10th, that practical steps might be taken to substitute close collaboration for controversies.

Wayleave Difficulty.

Mr. C. W. Marshall (Central Electricity Board) said that the greatest difficulty in connection with the grid scheme had been in obtaining wayleaves, and called attention to the unfair Press campaign that had been conducted, for instance, in connection with the lines that were to run across the South Downs. He showed a reproduction of an illustration that had appeared in a London journal, purporting to depict what the South Downs would look like when the overhead lines were constructed, and pointed out that if the overhead cables were in the same proportion to the landscape, as shown on that illustration, the conductors would be about 15 in. in diameter. Lantern slides of actual construction emphasised how different the real thing is from what had been suggested in this particular instance.

Mr. W. Fennell (Mid-Cheshire Electricity Supply Co.) showed a number of lantern slides indicating what had been done in his area in regard to secondary transmission at 33 000 V, and drew special attention to the manner in which the pole lines blended with the general surroundings and did not even put any land out of cultivation although they ran across arable land. One slide showed poles carrying 3 000 V lines at the top and the low tension distribution lines below. This avoided running two pole lines to supply a village, and was, he thought, a line of development that should be encouraged. The particular line illustrated had been sanctioned although there had been a certain amount of difficulty with the Electricity Commissioners. Referring to the Report of the Council for the Preservation of Rural England (Schedule B), Mr. Fennell said the suggestion was made there that this particular Council should be added to the list of authorities to whom plans and details should be submitted when any scheme was contemplated, the suggestion also being that there should be a sufficient period of delay to enable this body to consider any such scheme before it was proceeded with. He objected to that as another of the obstacles that had to be overcome in connection with rural electrification and felt that it might be done in a better way. The method he proposed was that the engineer responsible for any scheme should collaborate with those concerned with amenities in the very early stages before the scheme actually got on to paper in any detail. In that way it should be possible for such an organisation as the Council for the Preservation of Rural England to assist the supply authority to obtain wayleaves and thus keep lines away from the public roads, where they were more objectionable than if they were carried across the country. He therefore suggested that collaboration between the supply authority and those responsible for amenities should be a general and not a formal thing. Indeed, he felt there was an obligation on the C.P.R.E. to assist in this way and to arrange that somebody should be available locally with whom this collaboration could take place.

Mr. B. G. Drummond, who showed some illustrations of overhead line work that had been erected in East Anglia, said that although his greatest difficulty had been in connection with wayleaves, he had found the local authorities were much less troublesome than the private landowners in granting wayleaves. A line that had just been completed between Ipswich and Stowmarket, at 33 000 V, was dead straight for more than six miles. He believed this was one of the longest lengths of straight line in the country, and in that case there had been no difficulty in getting the necessary wayleaves. The line had been in operation for two or three months and the local residents now regarded it as a permanent feature of the landscape. In his company's Essex areas, in the case of one important line, all the wayleaves except one had been obtained, and as it was necessary to appeal to the Minister of Transport over it, there would probably be a delay of three or four months and supply to the villages to be served by this line would be held up. It would be an excellent thing if there were local representation of such a body as the C.P.R.E., with whom the supply engineer could collaborate in the very early stages of any proposal.

Major Theodore Rich remarked that in this country we were in about the same position as regards rural electricity supply that the Continent was in before the war, because there had been greater obstruction to getting electricity to the farm and the countryside than there had been on the Continent. It had frequently happened that a local authority would refuse to allow an overhead line to be constructed and at the same time complain of the high cost of electricity, which was due to the cost of having to place the line underground. In France no fewer than 21 000 villages were receiving an electricity supply, a good many of them before the war. After the war, the French Government, guided by men of many years experience, appreciated that it was not a question of generation or super-power stations or of massive grids, but that it was purely a matter of distribution and getting the electricity to the villages. As a result, money was advanced without interest in the case of the poorer districts, whilst in the case of the more populated districts, the necessary money was advanced at interest and amortisation, and so it was that 21 000 villages in France now had a supply of electricity. In some parts of Northern France from 70 to 90% of the population had a supply, whilst in Germany he believed there were 35 000 villages which had a supply of electricity. As regards Holland, which had been mentioned, that was a country where the subsoil was extremely bad and it was difficult to find planting places for poles. The atmosphere on the coast was also such that there was great trouble with insulators, and that was why so much of the 10 000 V lines in Holland were placed underground. Major Rich showed a number of lantern slides of concrete pole work on the Continent.

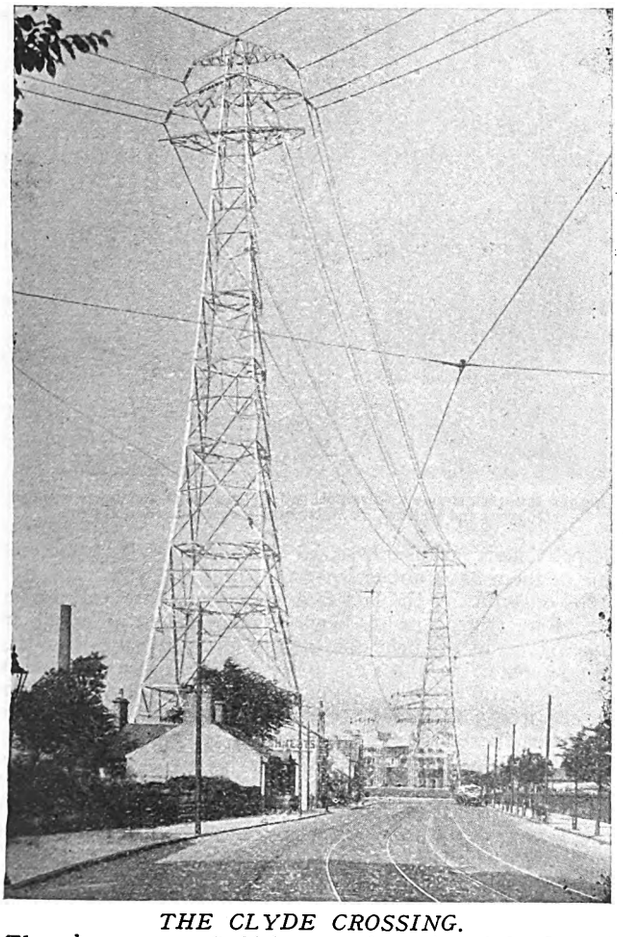
Architectural Features.

Mr. Clough Williams-Ellis (president, Council for the Preservation of Rural Wales) said there were very few places in which he would not welcome the centrifugally cast posts that had been shown by Major Rich. Incidentally, he added that he had little doubt that in course of time these overhead transmission lines would all be placed underground. He would rejoice if that were the case, but there would still be certain other things left above ground, such as transformer and sub-stations, and it was to be hoped that the architectural features of these would be made to fit in with the surroundings. He did not think it fair to describe the C.P.R.E. as another obstacle. Everybody recognised that electricity supply must come and for the moment by way of overhead lines, but what the C.P.R.E. sought to prevent was unnecessary uglification. Moreover, it desired to help to prevent irresponsible criticism of electricity supply schemes by means of overhead lines, and if only those who were responsible for these schemes would go about the work with some tact and some regard for the amenities of the country-side, with some goodwill and small concessions, there would not be a great deal of criticism. Many districts were already satisfied with the exception of the matter of the insulators, a small point, perhaps, but yet one deserving of some consideration. Why use white insulators which showed up so on the country-side? If there were no technical objection, he suggested that green or brown insulators would be better. What the C.P.R.E. asked for was to be informed when new schemes were contemplated and not

Digitized by Google

necessarily to be given complete drawings, because, as an architect, he knew that by the time the drawings were out things had gone a long way and it might be difficult to make modifications. If, however, the C.P.R.E. representatives were consulted in the very early stages, it would often be possible to agree on a route and thus facilitate the work in a very marked way. There had already been many cases in which that had been done to the general satisfaction, and he regarded the suggestion made by Mr. Fennell in that connection as worthy of acceptance.

Mr. S. C. Bartholomew (General Post Office) said that the Post Office was in a slightly different position from supply authorities, because most of their lines were along the highways and they were subject to some control on the part of the local authorities. A few cases had been taken to Court, but it had been very seldom that a decision had been given against the Post Office on the question of amenities. In some cases the difficulty had been overcome by the local people paying part of the cost of putting the line underground, and he gave



THE CLYDE CROSSING.
These towers, 270 ft. high, carry the mains of the Central Scotland grid across the river.

that as a suggestion to electric power supply people when they found themselves faced with wayleave difficulties and there was no other way out. He was inclined to think there was something in the point made with regard to coloured insulators.

Mr. W. A. Turnbull (Aylesbury) also spoke of the satisfactory manner in which he had collaborated with a representative of the C.P.R.E. in connection with the rural electrification work he has been doing in the Aylesbury district. In one case there was opposition, but the representative of the C.P.R.E., without knowing the route which he himself had previously chosen, actually suggested that very route as the best.

Sir Richard Paget, who is responsible for the C.P.R.E. electrical side, emphasised that the C.P.R.E. was entirely in sympathy with the idea of electrifying rural England. At the same time, it was felt that this electrification should be done in the best possible way. In the matter of preserving the amenities of the countryside and of assisting electricity supply authorities to obtain wayleaves without trouble, the C.P.R.E. could be of great assistance if only the supply engineers would consult that organisation at the earliest possible stage in any proposed scheme. Speaking on one or two points of detail, Sir Richard emphasised the need for consideration to be given to the design of poles and towers and suggested that anything in the nature of an Eiffel tower, construction was extraordinarily incongruous in proximity to old Elizabethan cottages, for instance. On the other hand, concrete construction in these circumstances could be perfectly congruous.

Mr. E. K. Scott said, in regard to transmission line towers and poles generally he thought that they could be made less objectionable if trees were planted round them to hide them as much as possible. He added that in 50 years all power lines would be placed underground, but in the meantime the supply must be got to the villages in the cheapest possible manner.

Mr. H. G. Griffen (secretary, Council for the Preservation of Rural England) confirmed the general attitude of his organisation on the question of rural electrification that had been outlined by previous speakers, and said that the representatives of the C.P.R.E. had always met with the greatest courtesy from the engineers to the Central Electricity Board, and the local supply engineers. He did not think Mr. Fennell, in speaking of the C.P.R.E. as an obstacle, could be aware of the constitution of that body. The Council of the C.P.R.E. had represented on it all the large municipal associations, the country council associations, and also all the large professional associations. He acknowledged the great assistance that Mr. Kennedy, of Messrs. Kennedy and Donkin, had been to the organisation, and said that the report that had been drawn up and submitted to the Ministry of Transport had been largely based on that advice and assistance. The C.P.R.E. had its own regional planning experts which had been sent to various areas and had been successful in obtaining modifications of proposals after consultation with the local electrical engineers, and in this way had prevented a great deal of local protest.

Mr. W. Fennell, replying to the comments that had been made as to his remark that the C.P.R.E. was another obstacle, said that he had spoken from the point of view of what was stated in Schedule B of the Council's report. The suggestion there, to which he had already referred, was an obstacle, in his opinion, to the rapid development of rural electrification. The suggestion that had been made by the various speakers that those concerned with amenities should get into touch at the earliest possible stage with the supply engineers was a different matter altogether, and if adopted would prevent the delay which he foresaw would follow from the adoption of the proposal in the report.

Mr. Griffen, interposing, said that it was at the request of the local authorities themselves that this proposal had been put into the report.

Mr. J. Edward Seager (Deputy Clerk, East Sussex County Council) spoke with the object of making clear the position of the East Sussex County Council in relation to the dispute with the Central Electricity Board and the carrying of overhead lines over the Sussex Downs. It was maintained that the County Councils should be heard in relation to these matters, and he suggested that in future, quite apart from the Electricity Act, County Councils should be consulted before definite steps were taken in regard to any proposal, instead of them being placed in the position, as they had been, of being told that wayleaves had been obtained and that no alterations could be made. Another difficulty was that the Board went on with its schemes piecemeal, and a County Council having obtained a modification to a part of a scheme, found that this very modification introduced further difficulties.

The President then proposed the following resolution which, he said, had been approved by Sir Richard Paget, on behalf of the Council for the Preservation of Rural England, before he had been obliged to leave the meeting :—

> " That the Council for the Preservation of Rural England and the Overhead Lines Association agree to co-operate fully regarding the construction and location of power lines and all arrangements connected therewith."

Mr. Leonard Stanton, who seconded the resolution, objected strongly to the suggestion that engineers have no sense of beauty. He hoped the very educational discussion that had taken place would not be allowed to remain where it was but that a committee would be formed with the object of keeping all interested parties closely in touch with each other, so that, as Mr. Fennell had suggested, they could co-operate at the very earliest stage in regard to any proposals.

The resolution was carried unanimously.

RURAL ELECTRIFICATION.

Early Obstruction—Spread of Broader Views—An Asset if Carried Out on Common-sense Lines—Varying Conditions at Home and Abroad—Choice of Voltage.

(FROM A CORRESPONDENT)

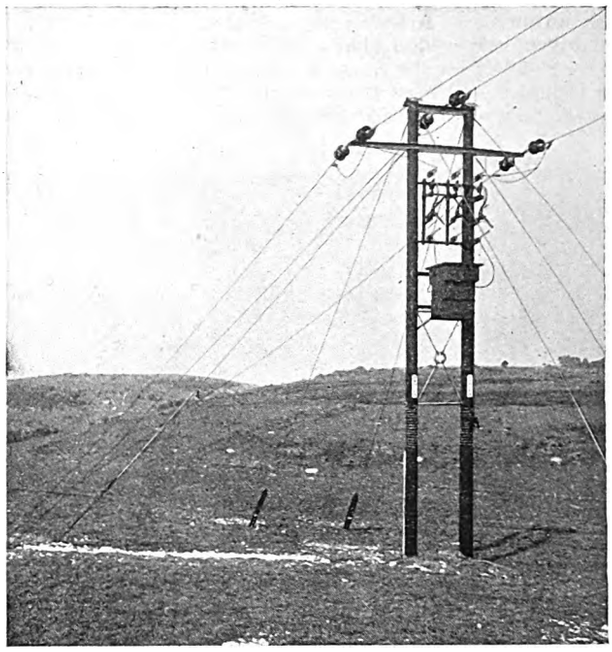
ONE can say without hesitation that Great Britain has been one of the last countries in the world seriously to take up the electrification of the countryside; we had no water power to stimulate the supply to rural districts near turbine power stations and, further, most of our early power systems were started in big centres, not merely because the direct current system, so much used at first, was not sufficiently elastic to supply rural areas, but also because the regulations on the one hand and the preliminary costs, the outcome of pettifogging obstructionists, were such that many who tried to go ahead were worn out with time-wasting worries.

At home, and also in some districts abroad, were to be found people connected with cable-making and other interests who were so short-sighted as to oppose by various means the erection of overhead lines, because they thought that by doing so they would encourage the use of more directly profitable cables; the capital cost of cables with the cost of laying being such that if overhead lines were not allowed thousands of villages and farms would not be able to afford the capital cost of the necessary mains at all. In some places the opposition to overhead lines in the past on æsthetic grounds was such as would lead one to presume that it was inspired.

In recent years in most cases the broader view has been spreading that a village supplied with electricity through overhead lines, that otherwise could not be supplied at all, could become a little centre of demand for house wiring materials and accessories, for small motors and household appliances, almost all of which would bring grist to the mill of those interested in wire drawing, cotton covering, rubber cabling and items required for house wiring. Firms which grasped the common-sense view practically from the start were Messrs. Johnson and Phillips, of Charlton, and Messrs. Crompton, of Chelmsford, undertakings which had done pioneer work overseas in the direction of overhead lines.

During the war many thousands of "Tommies" went around the North of France and Italy and found electric light in scores of villages and wondered why they had not similar facilities at home; even now some people travelling abroad have been heard to say that engineers in Switzerland or Italy must be much more up to date than ours because electric light is to be seen in so many remote places.

A few years back professional politicians jumped at the conclusion that an electrical millennium would come if only power stations were big enough, and some of those who had obstructed overhead lines suddenly became ecstatic over pylons and grids "to save agriculture," not realising that the sparser the consumers per square mile the greater the retailing costs; whereas with modern plant, large or small, it makes but little difference where the wholesale supplies come from.

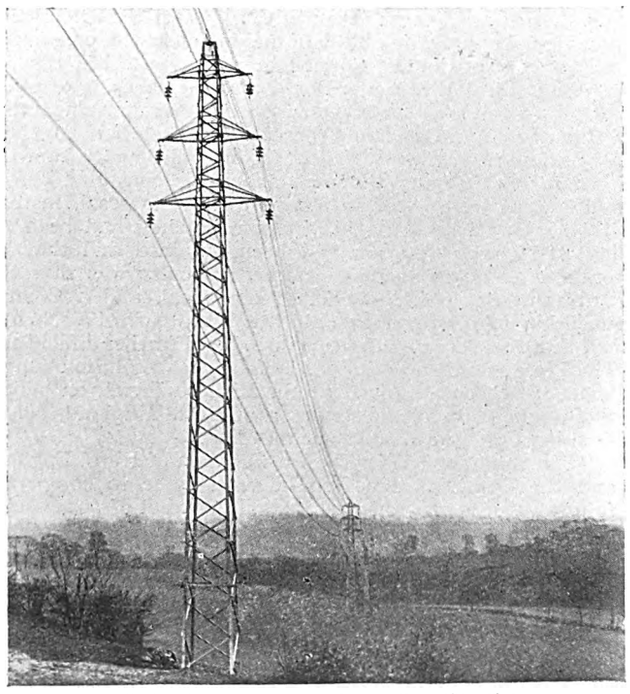


Rural transformer station with vertical pattern horn switch and bomb type fuse (Johnson and Phillips), on Portsmouth Corporation rural system.

The politicians, as usual, seized the wrong end of the stick; some of them have not grasped the right end yet.

It is only during the last five years or so that the problem of rural electrification has been seriously taken up at all, and quite a crop of applications for authority to supply villages are now made to the Commissioners each year; there is, however, one feature to be guarded against—rural electrification is not a gold mine. It is an absurdity to compare impoverished Britain and war-stricken Europe with America, where many natural resources have hardly been scratched. Across the Atlantic enormous wealth was made during the war, and in many parts money is so easily gained that people often leave on their lights for days because it is too much trouble to turn them off. Rural electrification can be an asset to the nation, when carried out on common-sense lines. Given encouragement at the start it can pay its way, but it cannot stand company promoters' inflated profits or boom-watered capital; it should be aided in every way, but viewed by the investor and the authorities in a proper perspective.

When telegraphs and telephones were first invented, overhead lines were used because air is such a cheap insulator; the metal conductor, a post every 50 to 100 yards, and insulators, and the line would operate satisfactorily. Some people have been heard to say that as the Post Office has installed thousands of miles of underground cables, electric power authorities should follow suit. Many of those who read about the effect of storms on Postal pole line circuits naturally assume that power lines must be equally vulnerable and, owing to the voltage used, many times more dangerous. In the first place, the demand for the passage of simultaneous communications has increased enormously, which involves the multiplication of conductors, despite multiplex working; it is now possible with the aid of valve amplifiers to utilise pairs of very light gauge copper conductors in paper and air space cables of a type and for distances impossible not so long ago, and, further, comparatively light gauge aerial conductors large enough electrically for communication duties are weak mechanically



Stockport-Macclesfield secondary section of the Grid.

Digitized by Google

when subject to severe storm stresses.

Electrical power circuits have to carry amperes, not milliamperes, excessive voltage drops through resistance involve corresponding losses of energy worth money on the market; the much larger conductors used naturally have greater mechanical strength and, therefore, capacity to stand up to storms. The limit of voltage is that which the air will stand for a given conductor diameter and distance apart without severe energy losses through corona discharges; there is also the advantage with aerial conductors that the heating effects such as those imposed with cable transmissions do not so materially limit the amperage, which can be carried by a conductor of given size.

The engineering problem before those who plan overhead line systems is to use as high a voltage as possible consistent with line insulation, transformer and apparatus costs, as small a conductor as is mechanically desirable, having regard to the load to be carried, with the lowest cost for supports and wayleaves.

The minimum conductor is in most countries limited by regulations; at home No. 8 S.W.G. (or 0·201 sq. in.) for line conductors and No. 10 S.W.G. for service lines. In France 3 mm. diameter (0·0109 sq. in.) is allowable for high tension, although there are very many miles of 3·5 mm. diameter (0·0149 sq. in.) and 4 mm. (0·0195 sq. in.) line. (about 8 S.W.G.) in use on rural lines.

When comparing British, Continental and American H.T. rural distribution lines one must note that most British lines are cross-country and most Continental and many American are roadside. Owing to the necessity for arrangement and payment for wayleaves there is a tendency to use long spans at home, whereas for many roadside lines abroad, as curves may be met with, there is a tendency towards the limitations of spans, especially as in Belgium and France stays are objected to. The effect of ⅜ in. ice loading as a factor of design, as is the case at home, is to discourage the use of small conductors as a material increase in diameter does not so greatly affect the transverse load allowed for.

As a rule, up to lately, distribution and sub-transmission voltages were materially lower at home than abroad; the result being, within the desirable mechanical minimum, a reduction in conductor size in the latter as compared with the former. The average British line with its larger spans is, as a rule, heavier transversely than those abroad, although, with wood posts increased span involves increased height to allow for sag and minimum clearances from the ground, and the cost of poles after a certain point goes up much more rapidly than the length.

As regards voltage at home, 11, 33 and 66 kV seem to be favoured; there is some question, however, whether 33 kV is justified as a sub-transmission voltage; if heavy tower and lattice post construction is used for correspondingly heavy conductors, one may as well jump to 50 or 66 kV and have done with it. There is a possibility, however, that to a certain extent the rôle of semi-bulk distributor may be taken on by the Central Electricity Board, for which 33 kV has certain advantages. A tension of 11 kV has much to commend it for general rural work; it might have been, perhaps, a little higher with advantage; 3 000 V has some advantages for fen-land hamlets and scattered farm areas where only very small transformers are required.

CONCRETE SUPPORTS FOR RURAL AND TRUNK LINES.

Neat Appearance—Extensive Use on the Continent—The Centrifugal Process—Methods of Carriage.

(From a Correspondent.)

MR. J. H. THOMAS, in the House of Commons and elsewhere, has stated his desire to encourage the use of concrete posts for power and communication circuits, as a means by which employment may be increased through the use of home-made steel and cement and the employment of labour at home, as an alternative to the use of imported wood poles.

There has been lately a considerable and not entirely unjustifiable outcry by people of some influence in the country regarding the alleged disfigurement resulting from use of steel "pylons" to support the main grid lines, which are being put up almost from end to end of our little island. Some photographs of concrete posts in use abroad have been shown

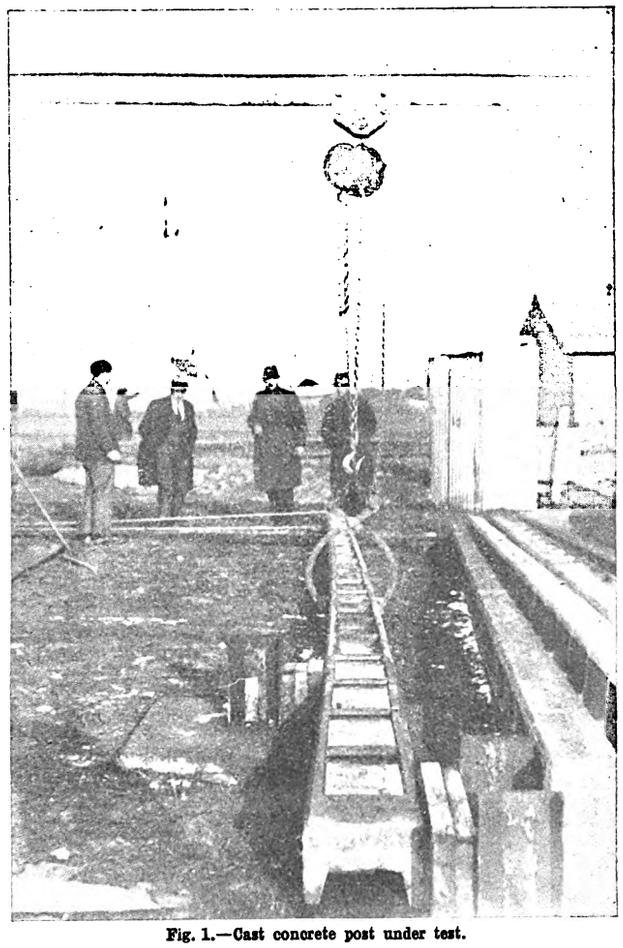

Fig. 1.—Cast concrete post under test.

to several of those interested in the question of rural amenities and considerable interest has resulted.

There is no doubt that, when well-made and properly designed, a post made of concrete can look quite neat and can blend well with rural surroundings. Some of the earliest posts made of concrete were used to support tramway trolley wires; they were somewhat clumsy. Twenty odd years ago the problem was taken up by M. Delamarche, the director of a cement company in central France, as it was evident that, apart from other questions, power posts of concrete form such an obviously good advertisement for the all-round use of cement.

Various patterns of cast concrete post were evolved, in section rectangular, hexagonal, U-shaped, boxed out rectangular and other types; it must be remembered that the French Government department of "Ponts et Chaussées" and its engineering school had much to do with the birth of the art of making armoured concrete; so it is not astonishing that a Frenchman was a pioneer in this direction.

By 1914, some posts, 40 ft. high, scientifically designed, were being made in the north of France for transmission line work. A little later, a system of the centrifugal casting of poles was started in Germany at Dresden, and some results of remarkable interest were obtained.

During the war, owing to the difficulty of getting good power line timber, considerable interest was taken in the use of concrete for such purposes; and later on, the development of higher-grade commercial steel, the manufacture of more rapid-acting and high-resistance cements, and increasing troubles through the rotting of war-time and pre-war poles, still further increased the development of what is in some countries quite an industry.

Systems of Pole Making.

There are various systems of pole making and distributing. As a general rule, posts for distribution voltages are cast, and those for trunk transmission work are made by the centrifugal process. Concrete posts are in use in France, Germany, Italy, Belgium, Spain, Austria, the United States, New Zealand and Brazil. Cast posts may either be made at a central works, or when ordered in some thousands for one area, can be made at some temporary local depot convenient for the supply of gravel, steel bars, and cement, or in some cases each individual post is cast on site alongside the hole into which it is to be placed. This system, naturally, has the most attractions when the aggregate is obtainable almost on site; that is why it has had some vogue in Austria for heavy power transmission and for the single-phase power supplies for railway traction.

A number of power companies are using concrete posts or wood posts with concrete bases for practically all their new work, primarily because the danger of deterioration is so small when made by competent firms. The trade has so much expanded in France, a country with many forests, that a special trade association has been formed to look after its interests.

There must be at present in use in France alone at least 700 000 cast concrete posts for power work, for voltages up to 50 kV. By the use of rapid-acting Portland cement or albuminous cement moulds can be used once every 24 hours, and the cost of manufacture therefore cut down. The art of making concrete posts, as in many other classes of work, depends on good organisation and the use of carefully designed appliances and tackle. It is strange that England, a country with very few forests, should be so far behind in this matter, but among the reasons is to be found the good class of creosoting work usually carried out for the preservation of poles, general ignorance regarding the use and attributes of armoured concrete, and the regulations which penalise concrete posts, by a high factor of safety based on the elastic limit. In New Zealand also, where but little pole timber is grown, and most of it has to be imported, a factor of safety of 2 based on the crippling load is accepted; such regulations enable concrete work to make progress.

Fig. 1 shows 10 metre (32 ft. 9 in.) cast concrete post, under test, of the type developed by the Sanca Company of Paris, which has supplied two-piece posts to the Corporation of Basingstoke, joined by means of a steel fishplate. This type of post is handy for cross-country work, as it can be handled across fields in two parts and bolted together.

The hair cracks, which appear on the tension side when under severe test, do not injure the pole, as they close up again; under a crippling load the work done in crushing the aggregate against the armouring usually makes the test strength somewhat greater than that theoretically obtainable.

The cast posts which are made of aluminous cement are somewhat blue brown in colour.

Owing to the foggy climate in some parts and the existence of white ants and other pests concrete posts are being used to a material extent for power work in Morocco and Algeria.

Centrifugal Posts.

The centrifugal process was first taken in hand in Germany before the war, posts are made up to about 95 feet in length. A squirrel cage of iron bars is wound round with wire in a sort of lathe on a collapsible spider; the wire spiral is tied into the bars in a number of points with fine wire; the

skeleton is placed in a steel-reinforced wood mould, the concrete mixture is put inside in the constituency of a pudding, the mould with the skeleton is revolved at high speed inside a series of rings fitted with clamping devices like the iris diaphragm of a camera lens. The centrifugal force drives the cement mixture to the outside and forces it between the bars and binding wires giving a smooth outer surface, the hollow inside being formed without any internal mould.

The moulding arrangement has to be the full length of the pole and therefore the plant is heavy. After casting the green pole is lifted at several points and put in a bed with sand

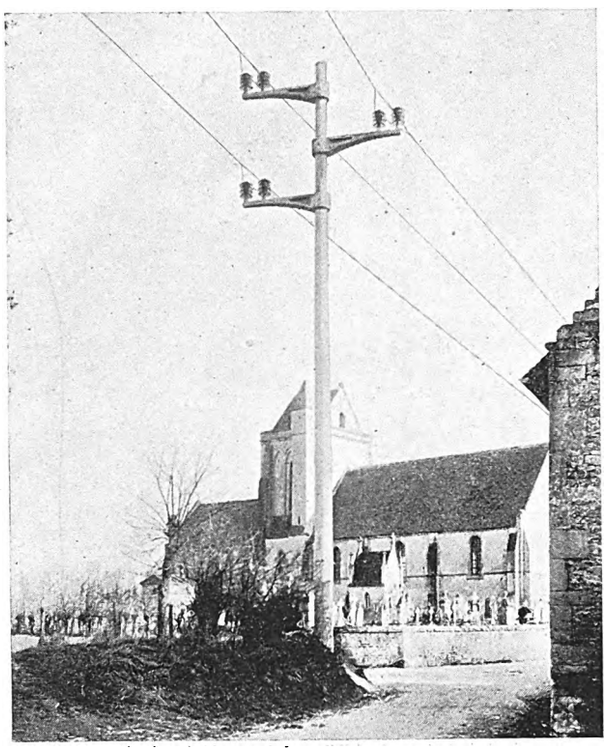

Fig. 6.—Centrifugal concrete post in a French village.

to mature. As centrifugal posts have to be made at a central depot, railway or other transport charges become an item and, therefore, the centrifugal system has developed in the main for lines of a transmission character which can stand heavier freight charges. Such posts have been sent by train ferry from Saxony to Sweden and posts made in France have been sent to Belgium. They are carried along roadways by a modified timber trolley or by turntable motor lorries with trailers.

Some people might think that it was impossible to handle long concrete posts, but experience has shown that with carefully trained gangs of men all sorts of difficulties can be surmounted; motor tractors have proved to be very useful, not merely for hauling poles on to the site, but also for use for operating lifting tackle.

Fig. 2 shows a straight line post in Italy used between Cornuda and Mestre; Fig. 3 is the type used for angle and anchor section. The posts are 22 to 26 metres (about 73 to 86 feet) in height, the conductor is 198 sq. mm.—·36 sq. inches, and the average span 200 metres. Tension 135 kV.

An interesting line runs from Fiume to Cislago; the tension is 220 kV. Fig. 4 shows the normal line structure. The height is 18 metres (about 58 feet) from the ground, and the cross arm is 15 metres long.

The conductor is of a high tensile aluminium alloy known as "Aldrey," 380 sq. mm. in gross section; there are two earth wires of galvanised steel, each 70·5 sq. mm. section. Average span, 260 metres.

Fig. 5 is the type of structure used for angles or anchor points. These posts were made by the Societa Cementi Armati Centrifugati, of Trient, Northern Italy.

Centrifugal posts for over 1 100 miles of H.T. line have been made by this company, it has also made tubular concrete structures for H.T. outdoor sub-stations and numbers of posts for trolley traction on the same system, besides many posts for the telegraph services in Italy.

Fig. 6 is a centrifugal post on a line between Argentan and Caen in France. The pressure is 90 kV, the normal span is 180–190 metres, and the posts are 18 to 23 metres long overall. The insulators are of glass.

As the brackets are of armoured concrete also, with the exception of the insulator pins and V-shaped guards which are only required at road and telegraph crossings, there is nothing to rust.

Concrete Post River Crossing.

An interesting utilisation of centrifugal concrete posts can be seen in Fig. 7, a crossing of the river Seine below Paris by 12 conductors forming four circuits, each conductor having a section of 105 sq. mm. (·166 sq. inches). The situation was such that owing to the existence of a towing chain in the river it was not desirable to lay cables on the river bed. There is a railway bridge alongside which is very old, known as the Pont des Anglais, and it was feared that heavy vibrations might injure any cable and sheathings. It was, therefore, decided to cross the river at a height well above navigation requirements and in order to avoid periodical painting costs armoured concrete was decided on for the supports.

The arrangement is designed to give a clearance of 17 metres (55 ft. 9 in) above the highest navigable flood level. There is a copper earth wire of 50 sq. mm. (·077 in.) above each group of these conductors.

There are two main spans, the central support being placed on an island in the river, it is 26·75 metres (87 ft. 9 in.) high. It is composed of three twin posts and is designed to stand a cross stress due to the angle of the conductors of 9 tons. There are three twin posts, the cross arms are 14 metres 37 ft. 7 in.) long, with spans of 164 metres and 176 metres The posts are cast separately, joined together on the spot with armoured concrete clamps and erected in pairs, each pair weighing 26 tons. Considerable care had to be taken to get the posts on site; they were delivered from the works by rail, then put on to lorries with trailers, put on to barges and taken over very soft ground, in the case of the central support, and then erected on solid bases. These posts were supplied by the Forclum Co. of Paris (Société Francaise des Potaux Electriques), for the Ouest-Lumière Company.

There has been a good deal of opposition to the use of pyramidal lattice steel structures on the Grid system which might have been lessened if concrete had been used.

In the first place our regulations as framed are distinctly hostile to armoured concrete, and, further, by demanding tower strengths and torsion stresses greater than found necessary in other countries with longer experience of pole line construction (although our climate is certainly troublesome), it so happens that it is difficult for concrete to compete despite the fact that supports are much neater than steel work, and require no painting.

If it was a question of 220/300 kV then insulating points should be minimised in number, but where only 132 kV is concerned it is a question whether shorter spans and lighter

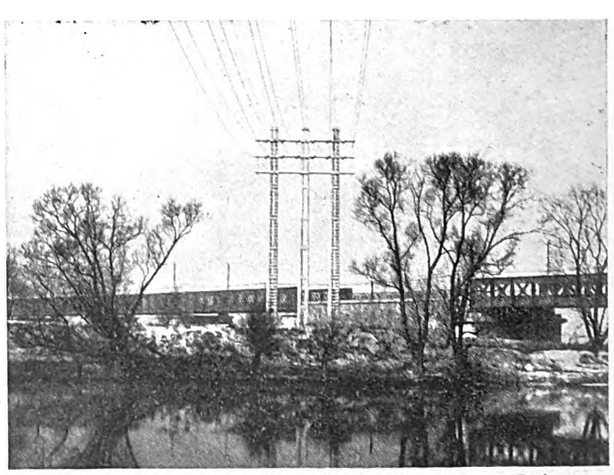

Fig. 7.—Triple concrete post crossing over the Seine, near Paris.

supports are not more economic as a whole than long spans and high towers—they certainly are not so conspicuous.

For trunk and transmission line work centrifugal posts are used very largely in Italy. About 500 miles of line over 30 kV have been erected so far. Centrifugal concrete is being used also for ornamental street lighting standards in Italy, France, Germany and Poland, and these look very neat.

AERIAL SECTION SWITCHES ON 15 KV RURAL NETWORKS.*

Desiderata for Satisfactory Switches—Use of Strain Insulators—Effect of Wind Gusts.

By Dr. H. OSTEN, Markisches Electricitatswerk A.-G.

IN spite of the already considerable value of section switches on aerial rural networks they would be more useful still if they were not so often liable to get out of order; the problem is troublesome, as most failures are not visible from the ground, especially at night.

The use of oil switches in builder-made cabins is too great an expense for rural areas; operating conditions encourage the use of ring circuits, which are mostly operated open, which

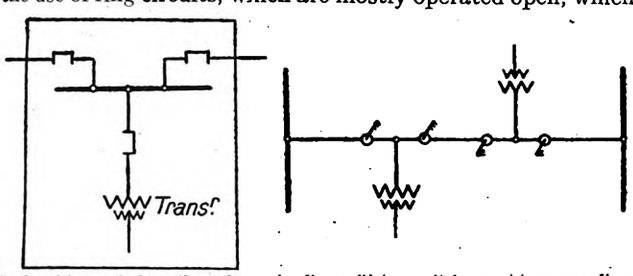

Fig. 1.—(*a*) Supply from through running line; (*b*) two switches on a transverse line.

can be closed or changed over by auxiliary switchmen at all sectioning points. Reliable aerial section switches are therefore required by supply authorities for medium voltages for rural lines, but although there have been many types, and new designs are put on the market each year, yet for a long time a good switch was badly wanted. The author, during 17 years on a 15 kV network, has had experience with 3 200 km. (about 2 000 miles) of line, twelve firms have supplied 654 switches, about one for every three miles. In the year 1928, 34 switches were deranged, in 27 cases concerning insulators. Derangements of such switches involve about six hours' work for replacements, and the cutting off of village networks; rural customers look on all such troubles as being serious. Often with village systems, arrangements are made to supply from a through-running line, to enable current to be obtained from either side; in such cases a built cabin is often used; for such conditions the arrangement shown in Fig. 1(*a*) is useful.

Instead of a cabin with three switches, two post-supported aerial switches can be used. Fig. 1(*b*) shows two such stations on a transverse line; with this arrangement the line can quickly be split up into sections. It is important to note that failure of section switches may result in great danger to linesmen, as, even when a switch is open, the line may be alive; in one such case an insulator cap was broken, making contact with the switch framework.

To prevent such a danger, it is desirable to earth the framework at the support through the neighbouring pole and earth the operating lever at ground level. [German medium tension lines are usually arranged without earth wires.]

The following are the desiderata for a good aerial switch:—

1. It must be possible to operate it under load with at least 50 amps., preferably 100 amps., even during snow or rain.
2. There must be a very large gap between contacts when opened, to prevent danger of leaving the line alive through birds or some entangled object.
3. When opened, it should be constantly earthed.
4. It should be arranged so that it cannot open by itself, for example, under great cold.
5. There must be double support on each side.
6. The use of caps on insulators or insulators with holes for bolts, etc., often leads to operating failures, other means of fastening must be utilised.
7. The position of the switch, "on" or "off," must be visible at the pole at a convenient height for the eye.
8. The rod for operating the switch must be light in weight, but not easily bent.
9. The switch should only require easily replaceable spare parts, taking up but little space.
10. The knife blades must not fall backwards; in other words, gravity should not tend to open the switch.

A.E.G. aerial switch, Fig. 2, has been designed to fulfil these requirements.

The A.E.G. Co. believes that, in order to obtain safety, a strong construction from the mechanical and electrical points of view is necessary to stand up to bad weather and rough handling. The switch has two sets of contacts, opening outwards, mounted on rocking arms. To carry the swinging insulators, perforation-proof insulators are used (made on the same principle as those shown in Fig. 2 on page 134). Strong iron caps are used to carry the contacts which are fitted with short horns. The special pins which carry the insulator cup supports are screwed to heavy castings; the crossbar is supported in bronze bearings. The line strain is taken off the moving insulators by means of strain insulators, and the switch is so constructed that the contactors open outwards, giving a space of 650 mm. (about 26 in.) to prevent bird troubles, etc. The jumper connections between the switch contact and the line are made of flexible copper cable, 50 sq. mm. area, held by means of special spirals so as to maintain their proper distance away from earthed parts. The switch is operated through a rod of bar iron with special springs to minimise mechanical shocks; it is divided into two sections through an insulator and is operated through a lock-up hand lever. The switch is made for 15 and 25 kV, and it is tested under an artificial wind to open under 100 amps. The above particulars and illustrations have been supplied through the courtesy of the A.E.G.

It is of interest to note the improvements which have taken place in the course of 20 years in the details of aerial

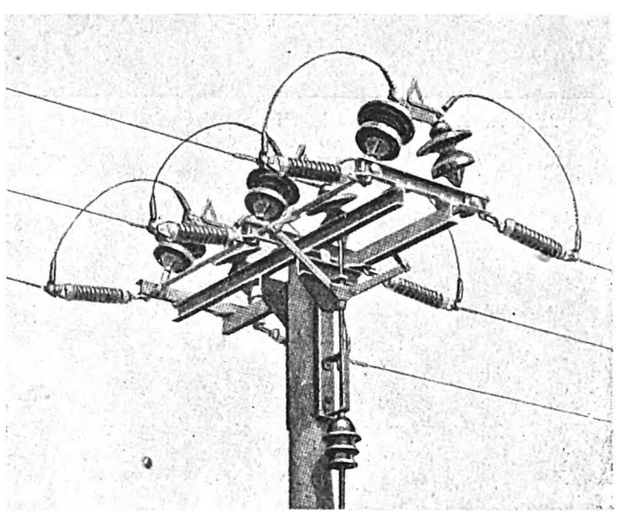

Fig. 2.—A.E.G. aerial switch.

switches, and to see how makers in different countries tackle similar problems.

The firm of Maljournal and Bourron, of Lyons, now absorbed in the French Grammont group of companies, well before the war also made an aerial switch with diverging swing contact on a channel frame; the contacts were carried by caps with somewhat long horns, the strain was taken off the swinging contacts by a second set of pin insulators placed on an extension of the steel frame instead of using strain insulators and jumpers, the latter of course, making a better job. The operating rod was also insulated but the new German pattern has improved guides to the operating rod; it is interesting to note, however, how many of the fundamental points of a switch recently turned out were anticipated 20 years ago.

In England, owing to the effect of wind gusts on jumper connections, the contacts are often connected to the fixed insulators by means of cable passing over hinged arms.

Aerial switches are not opened very frequently, and in some countries ice and sleet give trouble because the contacts may freeze together, so in America special sleet cutters have been fitted, for some time, to aerial switches; in France one make of horn switch has one fixed set of contacts and one that slides back; the latter having a slight upward movement as they begin to move back, the compound motion tending to shear off the ice.

PORCELAIN INSULATORS AND INSULATOR PORCELAIN.*

Electrical and Mechanical Stresses—Effect of Salt Storms—Reduction of Electrical Stresses—Improvements in Porcelain—Importance of Cost Factor.

PROFESSOR STEN VELANDER, of the Royal Technical University of Sweden, in 1921, at a time when he was head of the study and consulting section of the South Sweden Power Co., commenced investigations on the subject of factors affecting the useful life of porcelain insulators. The company in question made it a practice to examine insulators every half year, and to eliminate those which were faulty, before they reached the breakdown stage, thereby obtaining satisfactory running condition. Various information and data from home and foreign works were examined, and as a result of investigations new types of insulators were brought out in 1925 and 1926; later the question was studied with the co-operation of the Swedish Engineering Academy. The results of the investigations have been published in German by the Academy, a summary being presented in English and French at the High Tension Conference in Paris last year.

Professor Velander is of the opinion that in proportion to the commercial importance of reliable insulators as affecting the operation of power lines and industries dependent on them, much less is known about insulator porcelain than regarding many materials of comparable commercial importance. After an insulator has broken down, and parts have been broken away owing to the effect of arcing and high temperatures, with the effects of molten copper and various silicates and consequential blackening, it is difficult to find out the cause of the trouble; but experience shows that insulators on examination will show signs of cracks and so on, before they break down, and, therefore, if removed, can be examined and the causes of the damage studied.

Power line insulators are subject to electrical and mechanical stresses, some of the latter being due to thermal action. Study of statistics shows that the height of the voltage has but little noticeable influence on the percentage of failure. Published investigations show that with chains the insulator next to the conductor is not more liable to damage than the others. The insulators which are the highest, and, therefore, the most stressed by atmospheric disturbances, are also not subject to more failures than the rest. Electric stresses are not the primary cause of cracking.

With regular examination it is possible to reduce to a definite percentage the discovery and changing of insulators before they fail; it also becomes clear that the damaged insulators if left in place break down in time; in several cases where insulators have been looked upon as having been broken through electrically, the primary causes have been cracks. On lines which are not systematically inspected, one would, therefore, apparently find many cracked insulators; it is not, then, astonishing that during thunderstorms or such like disturbances, some are broken down. It is also possible, owing to some inner defects that with a steep wave, an insulator can be perforated as well as in a laboratory; this seldom happens with those of a good make.

The conclusion is arrived at that the primary cause of a perforation must be sought in a mechanically created crack, which at first may have only a microscopic character but opens the door to the current; the effect of the subsequent short circuit, with its powerful action, often concealing the original weak point.

The mechanical stresses are those of direct character from the conductor or other mechanical stress inside or outside the insulator itself, and finally there are stresses due to temperature differences. The conductor stresses vary with the conductor dimensions and span; data from makers in different countries show that various factors operate. An insulator carrying a heavy conductor has higher percentages of failure than those with light conductors; in South Sweden, branch conductors, where conductors of 16 sq. mm. (·025 sq. in.) are used in connection with conductors of 70 sq. mm. (·109 sq. in.), other things being equal, the failures on the sections with light conductors are only one half to a third those found with the heavier conductors. Long span and anchor insulators give rise to more trouble, and have a shorter life than those which act as suspenders only.

Mechanical stresses may be due to faulty construction, assembly, or erection. When built up insulators are concerned, the cementing may be a cause of subsequent cracks, one cause being the absorption of water. Difficulties with cemented insulators have been such that designs have been got out to avoid the use of cement altogether. Lack of care in cooling after baking may give rise to internal stresses.

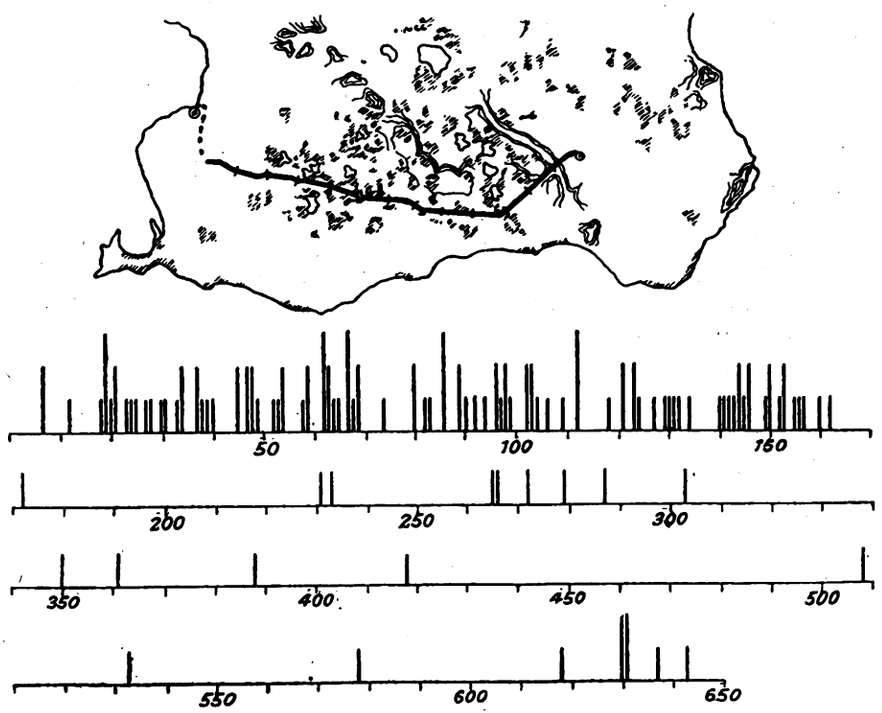

Fig. 1.—Insulator replacements.

Regarding thermal stresses, cement and iron have different expansion coefficients from porcelain; efforts have been made to remedy this difficulty by mixing something with the cement to make its coefficient equal to that of porcelain. It is noticeable, however, that insulators by the sea where the temperature variations are minimised often have more failures than insulators inland subject to higher variations.

Although more insulators fail in summer than in winter, it appears that this is due to the effect of thunderstorms on those already damaged; insulator failures are more frequent in coastal districts, owing to salt-spray storms. Salt winds blowing landwards quickly lose their salinity, especially when they pass over forests or a line of hills, and, therefore, salt-storms operate in a band of from 12 to 30 miles deep.

Fig. 1 shows the insulators replaced over a period of five years on a line about 12 miles from the sea in Sweden, with 650 posts. The country on the western (left) side of the diagram is flat, but on the east (right hand) side it is wooded and hilly; the verticals show 1, 2 or 3 insulators replaced per post, by far the most replacements are on the western side. Experience showed that insulator breakdowns in coastal districts are 3 to 10 times as numerous as those experienced inland.

In one part of South Sweden on the east coast, 3% of breakdowns took place in 12 years with soft gypsum cement; in

* "Ingeniörs Vetenskap| Alnadamien." No. 90. Published: Svenska Bokhandelscentralen, Stockholm. 3 Kr. 25.

Digitized by Google

another section, 8% in 10 years normal cement, whereas on the West Coast there were ten times as many failures. There is, of course, a higher direct mechanical stress when the land is open. The loss in a salt storm reaches ·5 kW per insulator, and may exceed 1 kW; in such cases the greatest heat energy loss is to be looked for on the underside of the insulator; the top can be looked upon as the equivalent of a metallic cap. Observation during a salt storm confirms this view; the heat below travels up, meeting the cooled top surface, thus creating great temperature differences and, therefore, stresses inside the insulator. The relationship between salt storms and insulator failures is thus explained. The cement joints of multiple insulators create further troubles under large temperature differences; the use of an elastic plaster as jointing

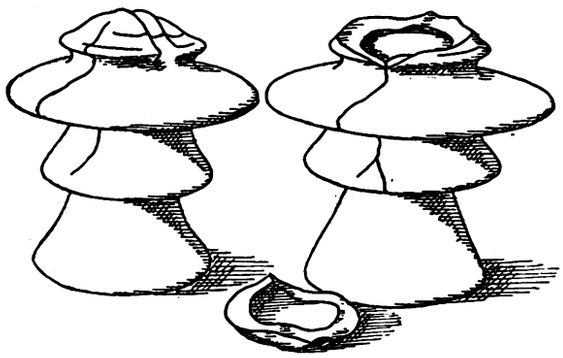

Fig. 2.—Typical cracks in insulators.

material is of great advantage in this direction. In many cases, therefore, cemented up multiple insulators have given more trouble than those made in one piece.

In high mountains, the percentage of insulator failures is increased, and this is obviously due to the rapid change from sunshine to shade, a matter of 20 to 30 deg. C. (36 deg. to 54 deg. F.) or more. Cold rain or snow can increase the difference between the outer and inner parts, as the latter naturally tend to hold the heat. With rapid change, the sunshine side is hotter than the shade side. Line insulators, without doubt, are subject to stresses of many kinds; some are constant, such as conductor weight; others are subject to long period variations, such as heat stresses, and to rapidly varying stresses, such as conductor vibration.

It is difficult to calculate the combined stresses which operate; one can, however, realise that the maximum stresses take place when the cracks are formed. Figs. 2 and 3 show typical insulator cracks; the circular cracks come from head stress, while those which are radial result from internal stress. Silvan ("Tecknisk Tidscrift," 1923, No. 11/12, Electrical Section) classes the stress as: tangential, due to internal expansion, radial in the horizontal parts, axial and bending stresses. He also showed that cracks do not appear all at once, but start as fine microscopic cracks, which gradually increase in length through the porcelain; the process may take months, or even years, before failure of the insulator. Experiences of the South Sweden Power Company show that after a crack has reached the surface an insulator may still hold up for several months.

Life Curves.

The insulator failures are not constant in each year: the first is usually free from them, then the number of failures increases in each year; this action is clearer and more regular when the insulators are well made and uniform in construction, and, therefore, one reaches a normal insulator life for the type under given conditions. It is desirable to make out life curves for different line sections selected with relationship to the climatic conditions, and position, such as open plains, hilly districts or forest, the groups being divided at points where the average life gives a material drop. Fig. 4 shows percentage life curves for a complete line with various conditions.

Fig. 5 shows a life diagram of two sections: Curve I, for insulators in a salt-laden plain with average life of 8·9 years; and II, average life 10·3 years in hilly land with forests.

For satisfactory operation, careful statistics for different climatic sections and insulator types are desirable with the aid of such curves, with also year to year percentage failure curves based on the years of life of the type considered. There is the problem as to whether porcelain is subject to special fatigue effects; it is not certain that the fatigue and elastic limits begin at the same point. Herr Draeger, of the Rosenthal Porcelain Works, considers that porcelain is not subject to fatigue and that insulators which have been in operation show no greater conductivity or liability to breakdown than those subject to similar temperatures in store. It has been found that small loads applied during long periods produce a permanent set in glass test pieces.

Reduction of Electrical Stresses.

The electrical stresses have no, or but little, influence on the life of an insulator; it is a mistake to demand too high a resistance to perforation, especially as it can be only attained at the expense of other characteristics, as a rule, that of the mechanical soundness and tenacity. The result is a weak and brittle porcelain, with added possibility of increased crack formation and an increase in the number of so-called (electrically) broken-down insulators. It is a rooted idea in certain circles that high resistance to puncture is an indicator of reliability. As an example, it was desired to modernise a switching station; the operating voltage was 6 kV. A type was asked for which would give 120 kV as break-down voltage; as the short-circuit stress was very high, the mechanical resistance never reached a factor of safety of 2. The insulator maker put forward an insulator with a break-down test of 80 kV; it was difficult to get this alteration carried into practice as the operating engineer preferred a 20 fold electrical test with 1½ mechanical factor of safety to a 12 fold electrical and 3 times mechanical factor.

With regard to a series of newer, so-called extra electrical-perforation-resistance, constructions of insulators, one can say that instead of being improvements they have led to a lowering in value.

The mechanical stresses can be diminished either by the reduction of the forces or the alteration of the form or dimensions of the insulator; the insulator must be designed with regard to sufficient flash-over resistance and mechanical solidity; the construction problem is very complicated. The forces acting can be lowered by altering the mechanical arrangement; for example, by the use of shortened spans or doubled insulators, or by altering the insulator dimensions, but one must guard against a consequent increase in thermal stresses and liability to breakdowns, which is the case with a series of thicker perforation insulators which have been placed on the market. Lack of care in manufacture and erection can give trouble; for instance, the screwing up of

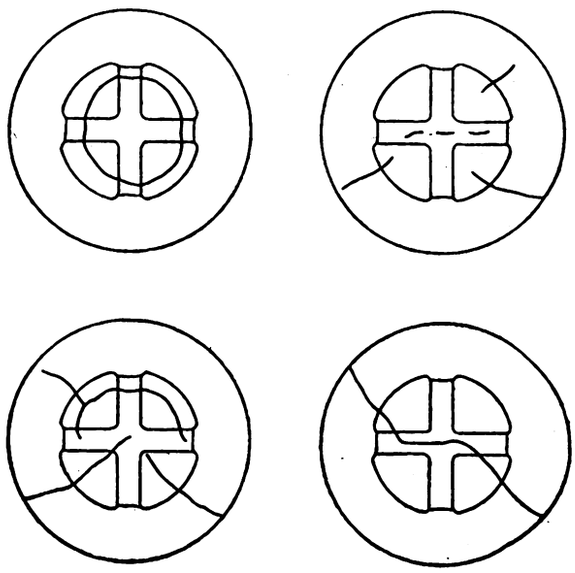

Fig. 3.—Cracks in insulators (sectional view).

the insulator too hard on the stalk, when the American construction is used, thereby damaging the thread. The form exerts great influence on the life; sharp angles are points of weakness and form centres for the starting of cracks. The thermal stressing owing to current creep can be diminished by the use of more units with chain insulation, but it is more advantageous to make small ribs on the underside of the petticoats which leave gaps on which the salt does not collect.

The use of an elastic layer on the difficult cementing surfaces can reduce the depreciation as each section can then expand on its own and there are only temperature differences within each section; the Ohio Brass Company uses such layers. As an example of this action, an old type insulator was

Digitized by Google

strengthened by fitting with a porcelain cap; when the cap was fixed with cement many failures resulted; later the parts to be cemented were painted with an elastic skin and the failures were greatly diminished. In Germany, where cement was first discovered as a source of insulator cracking, the use of it is greatly diminishing, and in that country for the building up of pillar insulators, hemp or impregnated cement are adopted. In America the so-called sanding system is favoured.

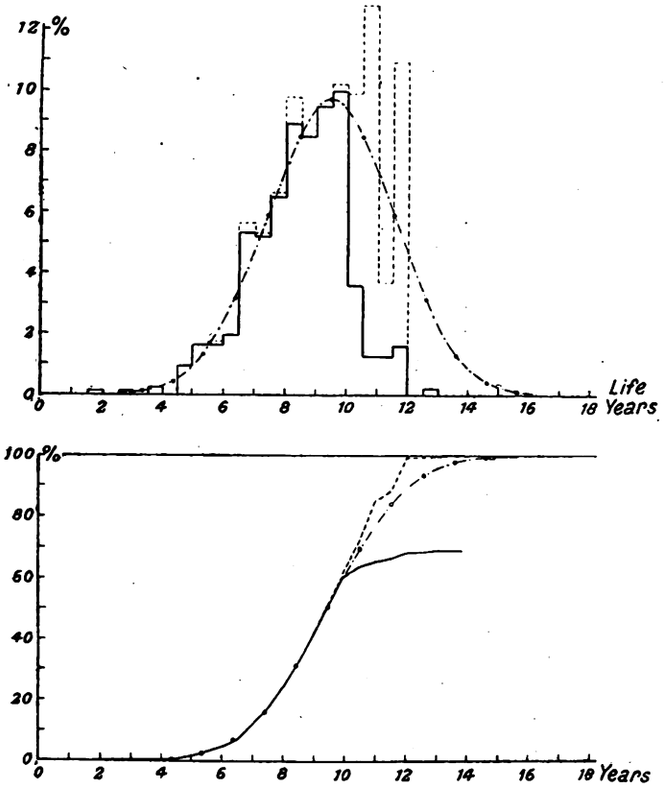

Fig. 4.—Insulator life curves (complete line).

A sort of porcelain granular material is glazed into the surfaces to be joined and then filled in with a bituminous substance, so that only the granular points touch the cement.

The question of the improvement of the porcelain substance is of interest, such efforts have resulted in many insulator troubles and failures. When an engineer finds himself beyond the operating limits of cast iron, he uses some other material, such as high tensile steel for his purposes; the question regarding insulators is—in which direction should the improvement take place?

The purely electrical considerations have perhaps gone too far; insulators are tested in stages and ultimately in high-tension laboratories, but the mechanical attributes have not received the same attention or control. Apart from the porosity, questions regarding tenacity, elasticity, heat-expansions coefficients, are in general not subject to research. The dye test is usual for porosity. The development of the chain insulator led to the arrangement of tensile tests which have not been carried far enough; temperature or temperature change tests in their forms up to date do not give any guarantee, usually the main point considered is a good glaze and white and even fracture.

It is only recently that the importance of mechanical factors has begun to be realised. In general, especially earlier, one hardly knew anything about the porcelain used in insulators. Variable results have been met with from insulators of the same type produced at different times. Four to five years of researches regarding the properties of porcelain show that very little has been done and published on the matter. Experts of insulator works can hardly explain matters regarding the mechanical attributes of porcelain, beyond the range of text-books; on the contrary, at the State testing laboratories at Stockholm, a series of impact tests of great interest have been made with household porcelain which bring out the great differences in the mechanical work of breakage of different types and show that makers can supply uniform and unusually strong material.

A section of these tests was devoted to the impact testing of various types of insulators in use which had shown different life factors; in some cases long life attributes corresponded with high test figures, although there were some great variations, while one cannot arrive at absolute tenacity values by this method one cannot get consistent results when comparing insulators of different types. As a result definite rectangular test pieces 20 mm. broad were sawn out of insulators; the test pieces were gripped on two sides and bending tests made so that the stress at the point of breakage could be measured; the variations of bending with load were observed; the results showing that apparently Hooke's law holds good. Each test was carried out twice so that both the glazed and unglazed side could be bent inwards. The tests showed, although experts from porcelain works said the contrary, a remarkably good agreement between the test results on the glazed and unglazed sides from one and the same insulator delivery. The limits lay between those given in handbooks but in some cases differed materially from the figure of 5 to 6 kg. per sq. mm. given usually by maker's experts. The modulus of elasticity of 3 000 to 6 000 kg. per sq. mm. was materially lower than that given in other published data. Analysis of the South Sweden company's experiences tends to show a distinct relationship between good mechanical properties and long effective life of insulators, it is remarkable that most of the insulators, whether giving good or bad results, have come out well in porosity tests, which tests only have value when some definite mishap has taken place in manufacturing. The researches tend to show that the mechanical properties of a good porcelain are improved by glaze and of a poor one the reverse; glaze affects the modulus of elasticity, the resistance to bending and impact tests.

Regarding temperature tests the resistance to breakage owing to differences in temperature in different parts of an insulator is inversely as the expansion coefficient, so that this should be as low as possible. It is remarkable that while materials such as cast iron and steel are subject to the strictest mechanical tests, in the past such tests for porcelain have not received the same attention, very great variations existing in mechanical test results. This question is now being taken up by makers and knowledge of the subject is increasing; there must be, however, alterations in standards and acceptance specifications.

The question is, why is it that, in view of the possibilities of control, constructors and operators have not demanded high mechanical strength? The fact is that up to recently nobody realised the value of strength as a factor; in many cases specifications were such as to enforce a low mechanical strength. The properties of porcelain cannot be altered at will, they must often be a compromise on one side for manufacturing reasons and the other to meet operating requirements; for instance, if the strength is raised the shape problem is made more difficult and so is also the baking problem. As a rule when the perforation resistance is increased so is the

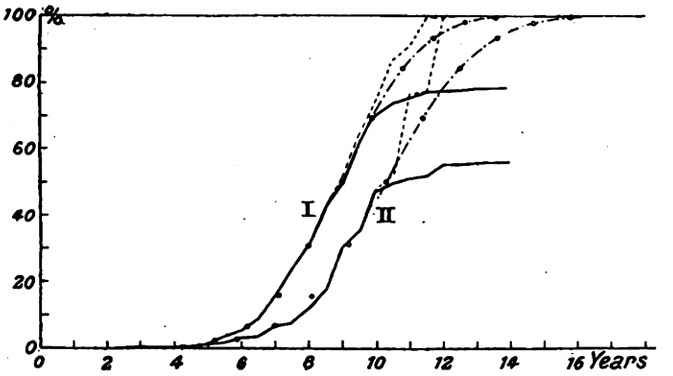

Fig. 5.—Insulator life curves. I.—On salt-laden plain; II.—In hilly, forested land.

tensile strength, it is probable that the tendency to lay stress too much on perforation tests has led to the delivery of weaker porcelains, which has indirectly led to increase in breakdowns in service; high tensile porcelain is as a rule more expensive and more difficult to make than weaker porcelain. So long as buyers fail to demand high strength and often demand the lowest prices, so long will high mechanical features fail to be dealt with.

Microscopic examination shows that strong porcelain has compacter and finer grain consistency and also a higher proportion of quartz. In none of the tests were quantities of

Digitized by Google

sellimanite or " mullit-crystals " found which some investigators claim as signs of high class porcelain.

The most appropriate test methods for control of the mechanical properties should be adopted, test pieces should be sawn out and the bending, ductility and temperature coefficients investigated. To carry out such tests would only be doing for porcelain what is done already for other materials. To get improvements, the results of researches of recent years must be embodied in porcelain technology, such problems being for the ceramic worker and not for the user. In the last ten years great progress has taken place through research regarding iron and steel and similar policy should be adopted regarding porcelain.

The whole question is of importance, the value of the whole of the insulators in our Swedish lines, including erection costs, is from half a million to a million sterling. When the useful life is short, as is the case to-day, there becomes necessity for changing insulators during operating times, which on account of Sunday work, travelling expenses and so on becomes an expensive matter. A complete change of the insulators of our latest constructed lines would cost a million sterling. With 10 years' life the average annual cost would be £100 000, with 20 years, £50 000, a great economy therefore. There are also the indirect advantages of diminished working interruptions, matters which must have even more influence than insulator replacement costs.

The value of an interruption of a power line measured by its results can be reckoned as a shilling per kWh out of service, together with output and wages loses and overhead costs. The total energy for Sweden is about 4 000 million kWh, with a maximum output of one million kW, therefore a stoppage of Sweden's power for only one hour costs £50 000. The question of trustworthy insulators is of the utmost importance.

One must have, therefore, for porcelain a clear and systematic plan of research with the assistance of all modern test methods, so that one can know which result to anticipate from a mixture of Raolin, felspar and quartz in given quantities, burnt under given and controlled temperature conditions.

The earlier and hitherto groping and subjective manufacturing methods are carried out in such a way that the mechanical properties of the porcelain produced vary between wide limits, far greater relatively than those for iron and steel; the situation makes the reduction of these limits an absolute necessity to enable better porcelain to be used on electrical networks.

T. R.

EXPERIENCE IN GREAT BRITAIN.

Failures not due to Electric Stresses—Mountain Mists and Coast Salt Deposits—Exacting Requirements of Modern Specifications.

(FROM A CORRESPONDENT.)

THE article entitled " Porcelain Insulators and Insulator Porcelain," calls for certain comments when considered in the light of experience in Great Britain.

From a general survey of the conditions reported from Sweden one would imagine that to erect a transmission line is equivalent to taking the responsibility for endless replacing of insulators, beginning within two years of putting the line in commission and steadily increasing until a happy time arrives when all the imperfect insulators have been eliminated. Presumably the same process goes on with the replacements until such a time as the percentage of these is small enough to cause an insignificant amount of interruption.

It is difficult to believe that this is a true picture of the troubles of transmission line engineers in Sweden, for under such conditions continuous service would be impossible.

Without fear of contradiction it may be stated that in Great Britain there has been a larger measure of freedom from trouble, for one can think of many transmission lines which have been in service for upwards of twenty years on which scarcely an insulator has been replaced. It might be argued that in these old transmission lines of ours the voltage is very low—in most cases below 20 kV—but the answer to this is supplied in the article under discussion, for the statement is made definitely that working voltage has no effect on the percentage of failures. We must look further for an explanation of the different results, and it would appear that a critical examination of the possible causes does not reflect unfavourably upon the English insulator manufacturers.

It will generally be agreed that electric stresses are not the cause of insulator failure. In the early days of overhead transmission, when porosity was a real trouble, failures may have occurred from this cause and the history of failure would be obscured in precisely the way which the author describes. Minute cracks are a different matter and their origin is to be expected in mechanical stresses, set up through various causes. When once small cracks have started their growth may be rapid owing to the freezing of moisture, changing temperature, and conductor vibrations

The fact that more failures are encountered with large conductors than with those of smaller sectional area is in the nature of a contradiction. When a high wind blows upon an ice-coated conductor conditions will be most severe for the insulator. Assuming a constant thickness of ice, then the smaller the wire the higher the relative increase in weight, and consequently one would expect greater risk of insulator failure. This, however, is stated not to be the case, and no satisfactory reason is given for the higher ratio of insulator replacements with larger wire.

Failures are shown to be more frequent in exposed localities either in mountainous districts or by the sea coast, which is generally to be anticipated. In positions of high altitude the air is less dense than in the lowlands and the factor of safety against spark-over consequently less. Mountain mists will coat all surfaces of insulators with moisture, which, though of high resistance, will demand insulators of larger size if ample safety factors are to be retained.

Near the sea coast the conditions are even more adverse, for salt deposits are highly conducting and necessitate insulators of special design if continuous service is to be expected. In localities where salt deposits are heavy, frequent cleaning of insulators is the only known means of preventing discharge and, ultimately, spark-over. Unless these difficult conditions have been taken into account when choosing the insulators, it is likely that surface discharges have caused local heating and led to the formation of the small cracks described by the author. In this instance, also, the cracks are of mechanical origin, though the explanation of their presence is the low safety factor against electric discharge.

In this country it is difficult to obtain statistics for comparison with those given for insulator life. The long service generally obtained and the small percentage of failures, owing to ample safety factors and perhaps in some degree to good insulators, add to the difficulty. Any consideration of comparative life must take into account conditions before the insulators were put into commission. The care exercised in selection of raw materials, the relative severity of routine tests and the grade of cement are, to mention a few factors only, of such critical importance that any one of them may explain wide differences in length of life.

The statement that insulators which have been in operation show no deterioration is borne out by experience in this country. Recently tests were conducted on some insulators taken from a transmission line on the East Coast, where they had been in service for seventeen years. The electrical and mechanical characteristics of these insulators proved to be similar to those of new insulators which had not left the factory.

In years gone by rule of thumb methods were responsible for haphazard designs, but those days are past. The exacting requirements of modern specifications demand accurate knowledge of the properties of the materials at the disposal of the designer and manufacturer of insulators. Only through organised research comes such knowledge, and the fact that insulators are available to meet the demand speaks for the progress which has been achieved.

Stress has been laid upon the apparent difference between the experiences of those responsible for transmission lines in Sweden and in Great Britain. Clearly they have their problems and we have ours. A wide knowledge of the conditions under which insulators are reguired to give service is of inestimable value to the insulator manufacturer, and close co-operation with the transmission line engineers leads to the elimination of trouble.

Digitized by Google

There is a risk that insulators will be damaged in transit. A blow received on the railway or during unpacking may produce the small cracks which will grow as time advances. The voltage applied as a test on the line is unlikely to reveal a small fault of this nature, for the remaining sound sheds of a pin insulator or the undamaged units of a suspension string will sustain the test voltage. The safety factor, however, has been reduced, thus sowing the seeds of trouble in the future.

The author lays stress upon the fallacy of increasing one essential property of an insulator at the expense of others. An adequate margin of safety against puncture is most necessary, and it is at least equally requisite that care be taken of all possible mechanical stresses. The means of obtaining the desired mechanical and electrical strengths are, to an extent, in conflict; so the best design is a compromise. It would appear that as most of the failures are of mechanical origin it is right to seek by exhaustive research and observation a full understanding of the mechanical and thermal stresses to which insulators are subjected. It is not a difficult matter to obtain a reasonable factor of safety against puncture and, by correct design, provision of arcing rings and other means, to avoid undue electric stresses in any locality.

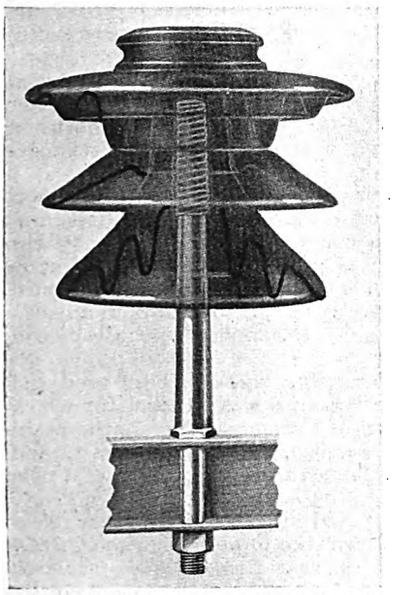
The price of insulators represents only a fraction of the total cost of a transmission system, but on them depends the continuity of supply. A generous factor of safety and the purchase of good insulators may add to the initial cost of transmission lines, but the relief provided by freedom from trouble amply justifies this long-sighted policy.

INSULATOR DESIGN.

British Pattern to Resist Salt Fogs.

DURING the last year or so on several occasions, owing to peculiar local atmospheric conditions, quantities of salt water have been drawn up and swept inland in the form of salt fog, which has settled on insulators, forming something in the nature of a conducting cap leading to considerable trouble.

Prof. Vellander in his notes on insulator characteristics and tests has discussed this question and recommends the use of ridges underneath the petticoats to concentrate the salt collecting and leave insulating ridges.



Special (Bullers) pattern insulator, for use in places exposed to salt fogs.

As pointed out nearly three years ago at the Paris High Tension Conference, where it is a question of a conducting deposit on an insulator, increasing the diameter alone simply increases the area of the path over the edge.

In view of the importance of the problem Messrs. Bullers, at their works at Milton, have arranged a special chamber with observation windows in which insulators can be tested while subject to saline mists, chemical fumes and so on.

Where an insulator has to face heavy snow, ordinary mist or a lower air density a larger insulator of normal type suffices to give an increased leakage path to comply with normal specifications regarding discharge.

The ordinary insulator is designed to stand flashover rain tests, which tends to search out those weaknesses which might give way to stresses met with under operating conditions, but a rain test does not, like a conducting fog, search out the underneath of the sheds.

As a result of experimental work Messrs. Bullers have brought out a special insulator for positions subject to salt fogs. The insulator is arranged so that the drippings from the sheds tend to fall clear of the sheds below, the top shed is therefore the largest in diameter and the bottom one the smallest.

The outside surfaces are kept smooth to encourage the running off of the concentrated brine, the top and middle sheds are arranged with small corrugations the lowest with deep corrugations. These corrugations slope outwards to minimise the distance to the spindle. The lip under the top shed is kept well out to keep the high voltage surface clear.

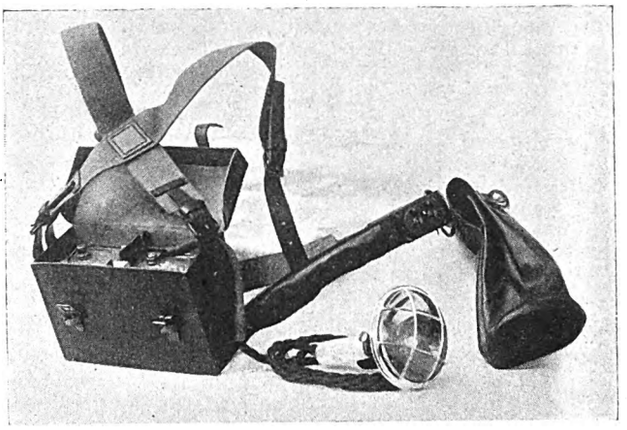
People have been heard to say that British manufacturers do not pay sufficient attention to research work, but the production of this new insulator shows that such a charge cannot be made against this old-established firm. It is interesting also to note that, acting independently, they have utilised corrugations under the sheds as recommended by Prof. Vellander.

INSPECTION OF LINES.

Tripping and Switch Batteries.

EFFICIENT and portable inspection sets are a necessity for linemen engaged in the maintenance of overhead lines. We illustrate a set of this type produced by Batteries, Ltd., Redditch.

The projector consists of a brilliant reflector, 100 m/m. in diameter, mounted on an aluminium carrying handle, so that the direction of the beam is easily controlled. It is fitted



Lineman's inspection set fitted with "Nife" cells.

with a high candle power 5 V double filament bulb with a double switch to allow of one filament being switched off when the full light is not required. Bulb and reflector are proportioned to give an intense concentrated beam, so that small objects are clearly visible at considerable distances. The battery consists of two "Nife" double cells of 18 ampere hour capacity, connected in series and having the foolproof and long life characteristics of these cells.

The battery is housed in a strong handsewn leather case, looped on to a thick leather body belt. This is provided with strong webbing shoulder cross straps so that the outfit can be carried without inconvenience and leaving both hands free.

"Nife" nickel-cadmium-iron-alkaline cells have proved themselves very satisfactory in the protection of h.t. switchgear. A large number of power companies have now standardised them for use in substations where they can remain for long periods without inspection. It is common practice for cells of this type to be charged only once every six or twelve months. A typical example is afforded by one instance where a 4-ampere hour cell gives a discharge of 12 amperes every time the switch is tripped.

Another interesting application of batteries in the service of the power substation is that of switch closing. For this work considerable power is required, and it is quite common practice to demand a current of 270 amperes for two or three seconds when a switch is being electrically closed. For the national grid scheme a lead-acid battery of 240 ampere hours capacity had been specified to provide this heavy current, but Batteries, Ltd., state that a "Nife" cell of the latest low resistance type, having a capacity of only 140 ampere hours, has proved to be quite capable of the work. To quote figures from actual test sheets after 129·6 ampere hours had been taken out of a "Nife" cell of 140 ampere hours capacity, it still gave six discharges of 261 amperes in quick succession, the voltage only dropping to 0·95 V, which is equivalent to a 110 V battery only dropping to 87·4 V.

INSULATOR DESIGN IN GERMANY.

Some Interesting Types.

THERE have been some interesting developments regarding pin-type insulators in Germany. In Fig. 1 the first insulator shown is of the old telegraph type; the Delta type is similar in pattern to types still in use in many countries. As the pin goes up to the side groove at the top the mechanical strain is mainly compression; this type is also used in the built-up pattern. The wide petticoat type gives a better electrical

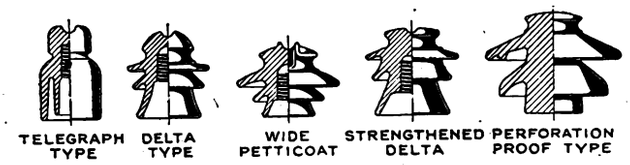

Fig. 1.—German types of pin insulators.

distribution, the insulator of the strengthened type has better electrical security but is not so resistant at cross strain. The last on the right is of the puncture-proof type, so called because of the long internal path necessary to reach the metal cup-shaped base. For cross strains it depends for security on the resistance of the porcelain to bending. The cup can either be

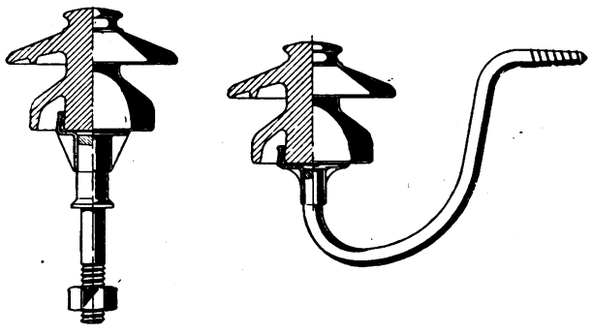

Fig. 2.—Puncture proof insulator:
a **(left) with straight stalk; *b* (right) with swan necked stalk.**

fitted on to a straight stalk Fig. 2(*a*) or else be fixed to a swan-neck Fig. 2(*b*).

Fig. 3(*a*) shows one type of cap and pin insulator designed by the A.E.G., used on this line. The bolt is made with dumbbell-shaped ends, the upper part is supported on a ring of balls kept in place with cast lead, a split porcelain collar is placed below and a lead ring cast to keep it in place.

Fig. 3(*b*) shows another type of insulator fitted with a ninepin-headed pin, the head is slit at the top and made to expand

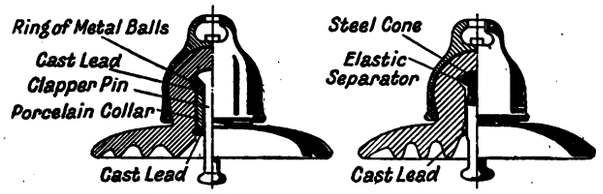

Fig. 3.—A.E.G. cap and pin insulator:
a **(left) with dumbbell-shaped bolt; *b* (right) with ninepin-headed bolt.**

into the internal spherical seat, after heating, by being pressed on to an internal cone.

In England one often makes a great fuss about mechanical strength without investigating as to whether it is necessary in practice. The stalk shown in Fig. 2(*b*) is circular in section, made of 1 in. bar with a coach screw and such a type of swan-neck, which is not attractive to birds, is listed for use on lines up to 35kV. If they did not give satisfactory service Continental engineers would not list them, although some people at home think them to be far too weak. As a rule bolted stalks for use with cross arms are not so stout as often called for by us, the fact that porcelain can be made to resist some bending moment as in Fig. 1, and the use of swan-neck stalks in many cases, tend to show that side strains on lines are not as great as are often allowed for, but also that the mechanical resistance of porcelain has been materially improved. Insulators of the pin or cup and pin type are used in Germany for tensions up to 35 000 V beyond which the chain type suspension is usually adopted. For a number of years it was considered that porcelain could not b erelied on in tension but only in compression, as in the case of a double petticoat insulator with the top of the steel pin level with the side groove. Fig. 4, showing a strain insulator, proves that under certain conditions it is possible to use porcelain in direct tension; it is of the A.E.G. type and several can be used

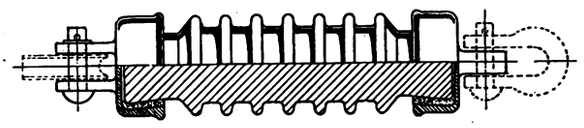

Fig. 4—Strain insulator.

in a string in series as desired for higher voltages. In the illustration of the aerial switch. Fig. 2 on page 127 this style of strain insulator is shown in use with jumper connections The Verband Deutsche Ingenieure has done valuable work regarding the standardisation of insulator pins and stalks. The illustrations and most of the remarks made are based on a list K.5/11 of the A.E.G. Co. of Berlin to whom thanks are due for the information supplied.

PORCELAIN FOR ELECTRICAL INSULATORS.

Highly Specialised Industry.

IN the course of a lecture before the Stoke-on-Trent Association of Engineers, on the subject of "Ceramic Engineering, with Special Reference to Electrical Porcelain Practice," Mr. H. S. Newman, a member of the staff of Bullers, Ltd., said that with the growth of the high tension transmission of electrical energy, the specifications had progressively become more and more rigorous, until at the present time it was only with the greatest difficulty that the pottery manufacturers could comply with them.

The tests to which the materials had to be subjected included tension, torsion, cantilever, combined tension and cantilever shock, porosity and heat resistance, together with the usual electrical characteristics and the certainty of interchangeability.

A typical modern insulator support for high tension switchgear, such as will be installed in the 132 kV grid stations now being erected all over the country, was described by the lecturer. The height of it was 42 in., and it was called upon to meet a torsion load of about 24,000 in. pounds, applied clockwise and anti-clockwise, as well as to withstand a cantilever load of anything up to 600 lb. applied at the top, and a tension of 10–15 000 lb.

Amongst the heaviest pieces that had ever been produced in vitreous porcelain in the Potteries was an insulator which was originally made for wireless transmission before the beam system came into use. It weighed, fitted, about 7 cwt., and it was the intention to instal nine of these at the top of a pole about 800 ft. high.

An alternative now being used in connection with wireless transmission was an insulator at the top of one of the G.P.O. wireless masts at Hillmorton, near Rugby. This insulator combination was proofed to 20 tons before despatch. Another massive combination was also in evidence at Hillmorton, and in this case the insulators supported high tension meters working at 1 500 V. for the production of high frequency current for the wireless gear. It was nothing unusual nowadays for the electrical engineers to call for articles in vitreous electrical porcelain standing 5 ft. 6 in. high and weighing approximately 400 lb.

The strenuous conditions with which some of the insulators had to comply could be gathered from the statement that at the Metropolitan-Vickers Laboratory, Manchester, the high tension flashover test under wet conditions was something in the order of 250 000 to 300 000 V.

The up-to-date electrical porcelain manufacturer had long since found it necessary to supply himself with efficient testing machines and high tension electrical plant, and in every way the production of porcelain for electrical purposes must now be regarded as a highly technical and specialised industry.

BULK TRANSMISSION IN GERMANY.

Efforts to Replace British Coal—Conveyance of Power to Markets—The Corona Problem—Use of Hollow Conductors—Eddy Current Dangers.

By THEODORE RICH.

SINCE 1914 the position in Germany regarding heat energy and power has been distinctly interesting. During the war, in order to save railway transport as much as possible, coke oven gas from the Ruhr area was pumped long distances for industrial heating and general gas supply purposes. About the same time great developments took place regarding the utilisation of lignite, a low-grade fuel that lies in age somewhere between peat on the one hand and pit coal on the other. This fuel is won from open pits with the aid of ladder, dredgers or grabs, the overburden is first removed and then the lignite bed which may be as much as 90 ft. in depth, is excavated; the lignite is shot into waggons, some of it is delivered in railway trucks in the neighbourhood; some goes for comparatively long distances; some is briquetted, which process reduces the bulk and drives off some of the water; and some, after preliminary flue drying, is shot over the bars of low temperature boilers to give steam for the generation of power in large bulk.

In Baden, Wurtemburg, and Bavaria there are considerable developments and possibilities regarding water power, with a certain amount under operation in The Eiffel, with new constructions in the Central plateau and on the Moselle river.

The lignite beds exist near Cologne on the western side of the Central Rhine and in the central plain on the borders of Saxony. The lignite contains a material percentage of water, and a high ash content so that transport costs tend seriously to limit the economic radius of distribution by rail. The demands of railway workers, aided by their massed political pull, and the charges on transport for Reparations account, have forced up rail transport costs; the destruction of the currency and repudiation of civil indebtedness organised by irresponsible politicians and financiers, during the landslide, forced up general labour costs which have not proportionately come down again, and owing to the nervousness resulting from such a policy, the theoretical industrial advantages from debt repudiation are being offset by the cost of accommodation for business. It becomes very necessary, therefore, to utilise to the utmost the natural resources which exist in the country. The lignite, although of a low grade from the point of view of

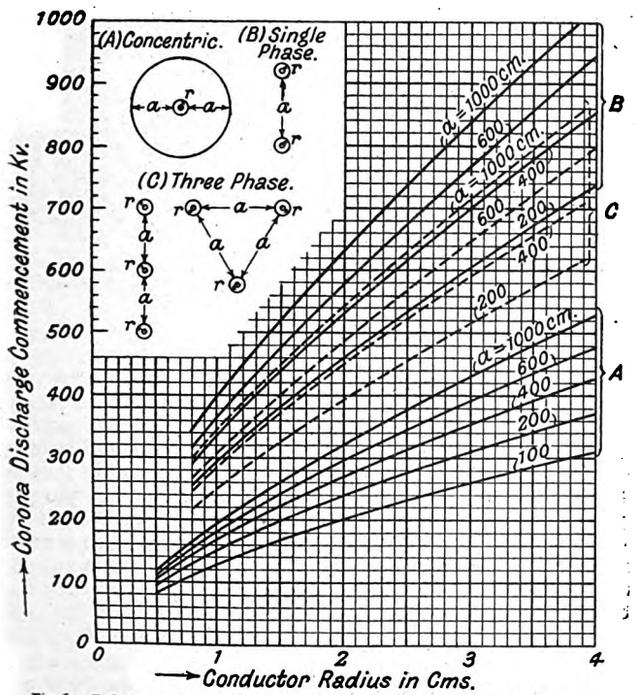

Fig. 1.—Relations between voltage at which corona begins, ; conductor spacing and conductor diameter.

thermal units per pound, is, on the spot, high grade from the point of view of man hours required for a given number of heat units available; digging fuel with a bucket dredger involving only pence per ton, the thermal units per unit of labour and stored labour being nearly double that obtainable from pit coal, with its deep mining, expensive pumping, timbering, gas risks and so on. After the war a certain proportion of the Silesian coal mines were placed in Polish territory, and a few years ago, as a result of German Government policy towards that country, supplies of coal from many such pits were cut off.

At the same time efforts have been made to minimise the dependence of North Germany on British coal by special

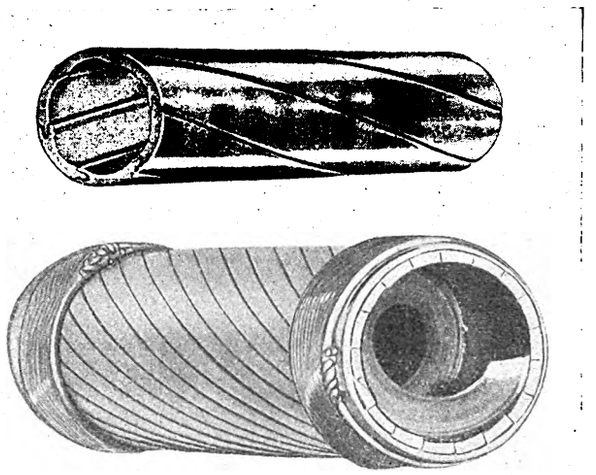

Fig. 2.—(*a*) Hollow conductor with tongue and groove sections. (*b*) Conductor built up of spiral strip-on edge.

water transport rates and so on, and to encourage the use of process coke in lieu of British anthracite for the tiled "pylons" which serve as stores in so many German households.

The development therefore of an easily won fuel, difficult of transport, and the utilisation of seasonal water power in the south, made the transmission of power in bulk a matter of national importance; there being definite points of supply and definite districts for consumption. The ordinary idea of a colliery power station for public supply is one which utilises duff and other coal of the lowest grade, the problem often being to secure sufficient cheap coal from the pit or pits alongside. The lignite problem is quite different; there fuel is taken in bulk from the open pits and utilised in huge power stations, not because the super-station is the best under all circumstances, but because most of the power produced has to be transmitted long distances before it can find a market. A certain amount of power has been used near the Central Germany lignite beds for the making of synthetic nitrates, but regarding such matters it is usually difficult to draw a clear line between strategic desirability and raw economics.

About four years ago, at home, some professional politicians and industrial reformers proclaimed that Germany had a wonderful grid system that we lacked primarily because the engineers and power authorities of that country were up to date while in Great Britain this was hardly the case. In actual fact, Germany either had to transport power from the lignite beds and waterfalls, or leave the lignite where it was or let the water go on running to waste; such bulk transmission was necessary if these national assets were to be utilised at all.

Power Transmitted to Find Markets.

The more one examines the bulk power situation in Germany, as in Italy, Scandinavia, Southern France and elsewhere, the more one realises that apart from mass electrochemical work such as the making of aluminium, cyanamide, and so on, while electric power is an important factor in industry, modern transport costs are of far greater importance; in other words, contrary to what we have been told by some doctrinaires, power has to go to industry to find markets and most industries will not go out of their way for power: they can nearly always make their own if required.

During the dawn of the manufacturing age industries had to go to Yorkshire dales, border townships, Thuringian valleys, and Catalonian gorges in order to utilise the water power

Digitized by Google

without which they could not operate their machinery, and even when the steam engine came into being, until canals and railways were made, industries still had to go to the neighbourhood of coal pits to get power. It is a great pity, therefore, that four years ago the members of the then Government at home did not have the courage of their convictions, that is to say, if they had any convictions, and throw open the power problem to a public inquiry, as then many matters relating to such affairs in our own and other countries could have been thrashed out, and much misconception and disappointment avoided.

"If the mountain will not go to Mahommed, Mahommed must go to the mountain." That is why, so often, where water power or lignite power is involved, mass transmission becomes essential; and then to avoid excessive copper costs, the highest commercial voltages become necessary even for comparatively short distances. When overhead lines are used it is possible to approach the Kelvin law that for minimum

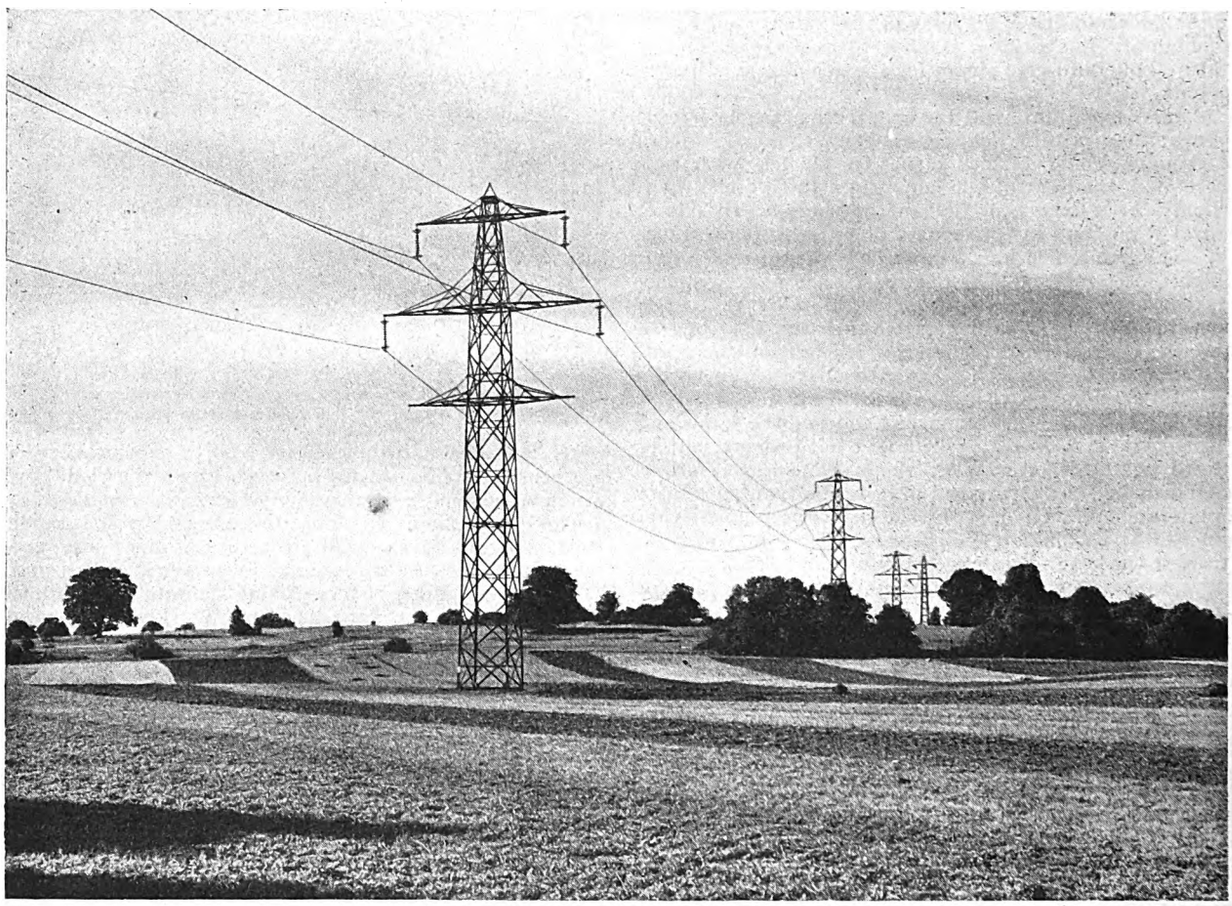

Fig. 3.—Cross country three-phase double trunk line in Germany.

total costs energy loss, values must equal transmission standing charges, and for equal percentage losses the power transmittable for a given conductor goes up as the square of the voltage, any heat being dissipated; with cables bad conductors of electricity are bad conductors of heat, so the carrying capacity, is limited.*

Contrary to popular ideas, the voltage which can be used for transmission is limited not so much by the insulators used as by the break-down attributes of the air that acts as a dielectric; the break-down limits being influenced to a certain extent by moisture and barometic pressure, but to a much greater extent by conductor diameter and distance apart, the initial stage being indicated by the corona. The total losses of a line are due to conductor heating, insulation losses surface leakage and corona; in lines up to 110 kV conductor heat losses predominate; the perforation insulation of porcelain is much greater than the flash over, dielectric losses can therefore be neglected. Fog is not of much influence owing to self-cleaning action; the leakage losses with three conductors come to about ·16 kW per mile of line; under rain or snow, at the above voltage, this is increased to about 1 kW. At the highest voltages corona losses become the main consideration, an important factor for any given conductor diameter and spacing being the voltage at which corona discharge commences; the distance apart and diameter must be chosen to obtain the most economic results to reduce these losses to a minimum; increased spacing means increased tower costs, and increased diameter involves wind pressures and ice loading; with certain limits, the latter had relatively more influence than the former.

Fig. 1 shows a table due to Professor Schwaiger (Elektrische Festigkeitslehre-Springer, Berlin) showing the relationship between the voltage at which corona discharge begins, conductor spacing, and conductor diameter obtained with A, central and radial conductors, B, single-phase, and C, three-phase conductors. As an example with 600 cm. spacing, 1·25 cm. conductor radius, the corona commencement voltage is 360 kV, with 100 cm. spacing the commencement is only, 400 kV but with 65% increase in conductor radius for the same spacing the commencement is at 495 kV. At 380 kV the choice of the correct diameter and spacing becomes of the greatest importance. Where two circuits are used in a more or less vertical arrangement, the sudden falling of masses of sleet or the unequal formation of ice can give rise to great trouble.

In order to obtain a large-diameter conductor without the excessive weight and cost of one built on the solid various designs have been devised. The conductor when built up must keep its shape, there must be no residuary torsion strains, it must be sufficiently flexible to go on to cable drums of reasonable size, and it must resist deformation during erection. The profile wires must pack so as to form a tight layer, so that under mechanical strains there will be no gaps, and will not spring out of place before being strained up; further, the surface should be cylindrical and as smooth as possible.

*The technical points given below are based on a paper by Dr. Rudolf Schien, of Essen, furnished to the writer by the courtesy of the A.E.G. Co. of Berlin.

Digitized by Google

The following systems of Ante-Corona large diameter cable have been developed.

An interesting design is on the tubular system, without internal support, made of hard copper drawn profile sections with tongue at one end and groove the other, bent into a radius so that each section fits in and interlocks, this can be seen in Fig. 2(*a*), many miles of it are used on the German grid system. This patented type of hollow cable was got out by the Metallbank A.-G., of Frankfort, with the co-operation of Messrs. Brown Boveri, of Baden. It is claimed by the makers that owing to its construction, no central support is necessary, and therefore there is no part which does not perform the direct functions of carrying the current and taking the mechanical strain, the weight is therefore reduced to a minimum.

The method of making the cable is simple ; it is built up on modified cabling machines. Owing to the fact that the conductors are in one layer, the line sections can be joined with simple screwed-up clamps. Particulars of this cable have been furnished by the Mannheim branch of the firm of Brown Boveri. This type of cable is made from diameters of 25 mm. to 50 with sections from 185 to 600 sq. mm. It is used on a line 220/300 kV that joins Cologne with the Vorarlberg and on a line, Hanover–Borkum.

About 250 miles of line for 220/380 kV have been put up with this class of conductor, 28 mm. (about 1·1 in.), external diameter 210 sq. mm. (.326 sq. inches).

The Felten Guillaume Co. has made a hollow two-layer conductor built up on a spiral made of bronze wire ; the A.E.G.

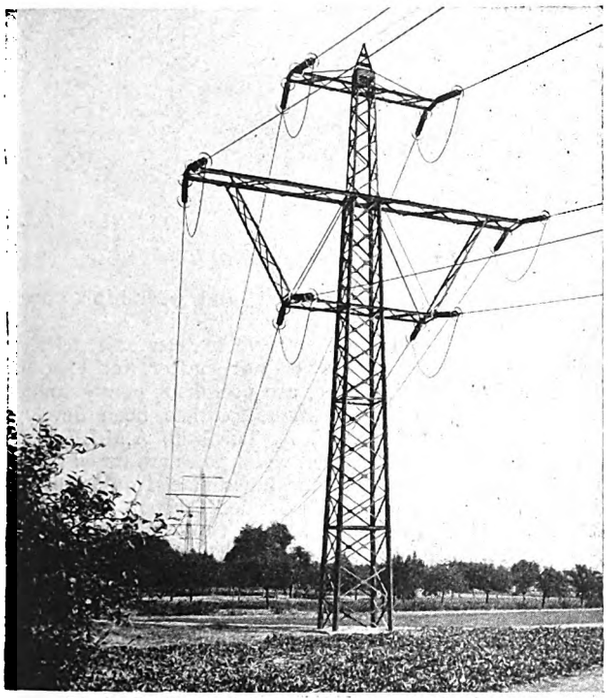

Fig. 4.—Double circuit tower with three conductors and one spare—earth wire above.

Co. built up a conductor with a central cable and a strip on edge wound round it like an archimedian screw with the outer profile wires laid in a spiral. The Siemens-Schuckert Company uses a strip twisted about its axis with zigzag corrugations on the edge to give a bearing to the two concentric outer layers. The Anaconda Copper Co. of the U.S.A. adopts a somewhat similar strip as a framework but of drawn metal in the form of an H, with narrow flanges also twisted round its own axis. Messrs. Thomas Bolton, a British firm, has developed a cable made up with a number of tubular conductors as spacers with alloy conductors where required to increase the tensile strength of the whole.

The Rheinishe-Westphalia Power Company, with the co-operation of the A.E.G., has developed a conductor within one or two outer layers built up on a spiral strip on edge, without central core, the strip being of T form with the top of the T radially outwards, thus making a sound job. This is shown in Fig. 2(*b*).

Dr. Rudolf Schien is of the opinion that with large-diameter aluminium-steel conductors there is danger of eddy current losses in the interior.

Fig. 3 shows a cross-country three-phase double trunk line in Germany with an angle tower in the foreground, span about 300 metres, conductors 40 mm. diameter, double-layer type 400 sq. mm. (·62 sq. in.) section ; as can be seen the insulator chains are fitted with arc rings at each end. The conductor is of the type shown in Fig. 2(*b*).

Fig. 4 shows a double-circuit tower equipped with 3 conductors and one spare with earth-wire above. Both these lines are for 220/380 kV. and were erected and equipped by the A.E.G. Co.

ALUMINIUM CONDUCTORS AND CORONA.

Lighter, Stronger and Cheaper than Hollow Copper.

By EDGAR PAINTON.

THE modern tendency to employ higher and yet higher voltages for power transmission makes the prevention of corona discharge one of the most serious problems which has to be tackled, and much ingenuity has been expended in

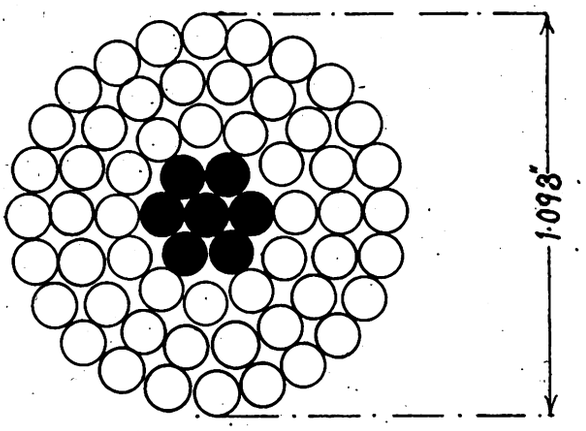

Fig. 1.—Steel cored aluminium conductor for 220 000 V.

devising special cable forms designed to increase the corona limit. The aim has been first to obtain the largest possible diameter with any given conductor section, and secondly to provide a smooth surface. Both of these are provided by the hollow conductor, made up of special shaped wires which interlock in such a way as to form what practically amounts to a tube. The conductor may be entirely hollow or some extra support may be provided for the interlocked annular ring of wires in the form of twisted strip of " I " section.

Though the construction is not essentially confined to copper conductors in practice, it becomes so, because for the highest

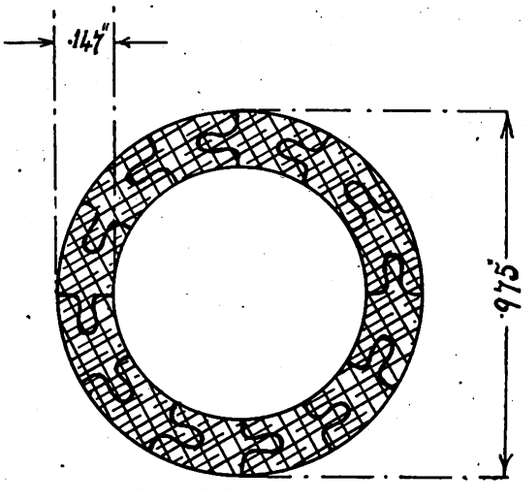

Fig. 2.—Hollow copper conductor.

voltages as yet commercially used the standard construction of steel-cored aluminium provides an equivalent corona limit at a decidedly smaller cost. Fig. 1 shows the construction of the steel-cored aluminium conductors used on the 220 000 V Conowingo and Wallenpaupack lines in Pennsylvania, and also on the 220 000 V Gatineau lines in Ontario. Fig. 2 shows a hollow copper conductor equivalent as regards electrical resistance and corona voltage. It will be observed that owing to the smoother surface of the hollow conductor the diameter can be made slightly less than with the steel-cored aluminium conductor. On the other hand, the copper

Digitized by Google

conductor weighs 3·46 tons per mile, as compared with 2·41 tons for the steel-cored aluminium conductor; the copper conductor would have a tensile strength of 10·0 tons, while the steel-cored aluminium conductor has a strength of 12·6 tons. Above all, however, the steel-cored aluminium conductor scores in the matter of cost. This conductor can be manufactured and sold with a reasonable profit at £235 per mile; but the 3·46 tons of copper in the hollow conductor would cost £290 *for wirebars alone*. Add to this the cost of rolling and drawing the special shaped wires, the cost of the assembling and closing down the sections to form a sound conductor, the cost of scrap, the profit and the patent royalties, and it is evident that the economic balance is strongly in favour of steel-cored aluminium.

Should it appear economical in any particular case to transmit at still higher voltages than 220 000, with very small conductor sections, it may still be possible with steel-cored aluminium to avoid the complication of the hollow conductor. Any required overall diameter can be obtained by increasing the core section. Steel wire is comparatively cheap, and owing to its strength is of immense value for an overhead line conductor if protected from corrosion by outer layers of aluminium. Instead, therefore, of using a hollow aluminium conductor it would probably be preferable to fill the hollow with steel wires and thus obtain the benefit of the long spans obtainable with high strength conductors.

It should be realised that the use of a large sectional area of steel, does not, as has sometimes been suggested, give rise to excessive inductance or magnetisation losses. It is necessary if the core section is large that the aluminium should not be in a single layer round the core, but should be in two or more layers stranded in opposite directions. With two layers of aluminium so stranded it is found that the inductance is identical with that of a coreless conductor, because the magnetising effect of one layer is counteracted by the other layer.

INSULATOR PRACTICE.

Porcelain, Glass and Moulded Materials.

FOR high tension work in Great Britain, and the Dominions, the United States, Scandinavia, Germany and Switzerland, porcelain is the rule. British makers have the advantage of having the finest China Clay (Kaolin) in the world at hand in Cornwall. Such is its virtue from the point of view of insulator manufacture that the largest makers of insulators in the United States have to send for it to get the best results.

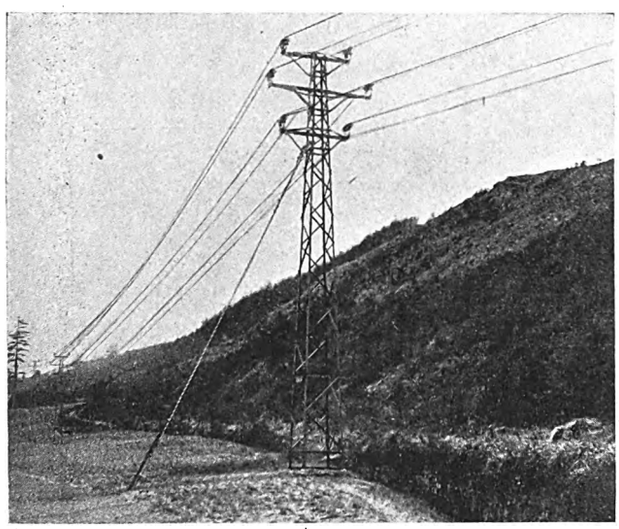

Fig. 1—.Lattice steel angle post and stay with double glass insulators (Estler Bros.) on line of the Ayrshire Electricity Board.

English makers claim that while labour costs, high taxation and social burdens make it difficult for them to compete with some makers abroad on cost alone, when life and reliability are concerned they are second to none.

In France, and to some extent in Italy, for pin insulators especially, glass has made great progress of recent years. They had a bad name in the United States at one time, because it was thought that inferior glass could be used, whereas to be successful, great care must be taken regarding raw materials, everything possible must be done to avoid or eliminate cooling internal stresses, and the insulator must be fixed on the pin so as to minimise stresses in that quarter. The use of polarised light, to detect internal stresses, has proved to be a step in the right direction.

The ideal insulator is one that is not easily broken, even by the stone of the small boy, and some people may wonder why insulators moulded under pressure made up of some of these special powders, should not be used for h.t. work generally. Up to date, nearly all materials having a measure of elasticity

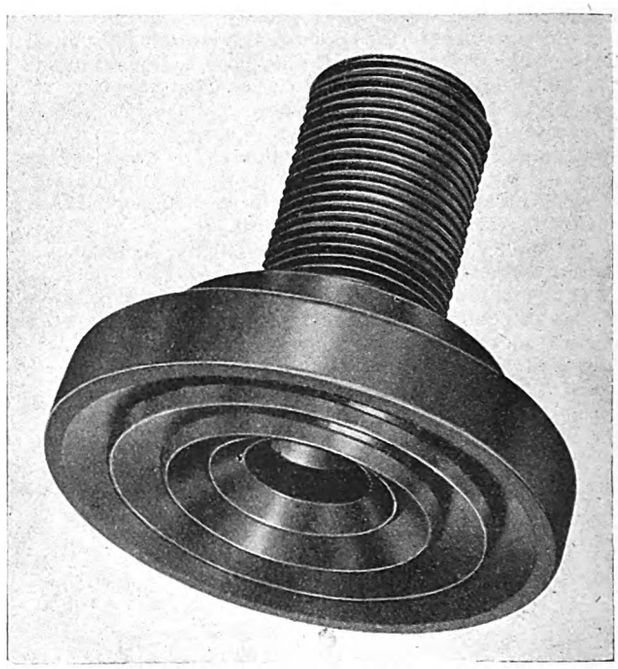

Fig. 2.—Moulded insulator made of Telenduron.

have been organic in composition, and with high pressure in the open there is danger of carbonisation.

Moulded insulators have their field in telegraph, telephone and low pressure work. They do not shatter, and look neat, and when of the spindle type, are useful for heavy stranded cables. A system of l.t. distribution has been developed around Aylesbury by Mr. W. A. Turnbull, A.M.I.E.E., the Borough Engineer, under which wood poles are bored through in the direction of the line, the holes placed one above the other, and the l.t. conductors threaded through; it makes a neat looking job. Fig. 2 shows the type of insulator used. It is screwed into the post, the ribs on the face keeping up the insulation during rain. It is made of Telenduron substance, a speciality of Thomas De La Rue and Co., of Walthamstow.

Under some special atmospheric conditions Telenduron insulators have been used for h.t. work, although l.t. is its special sphere of usefulness.

BOOK REVIEW.

Selektivschutzeinrichtungen für Hochspannungsaulagen. By M. WALTER. (Munich and Berlin: R. Oldenbourg.) Pp. vi+128. Paper covers. 7 marks.

The author presents, in a concise form, a comparative survey of modern methods of protective gear for high-voltage lines, and gives an introduction to the arrangement of such gear for new lines, with the necessary calculations of short-circuit and earth-fault currents. Few details of the actual equipment and relays are given, the reader being referred to technical periodicals and the publications of manufacturing firms; rather the application and calculation of protective gear are more particularly stressed, as filling a gap in existing treatises. The treatment deals largely with the "impedance relay" principle—a principle possibly less widely known to readers here than on the Continent, to judge from ephemeral literature. The calculation of fault currents follows the usual lines. The book contains an example showing how the impedance (or distance) relay system would be applied to a specimen network. The author writes from his own experience, and, as one of the first volumes on the subject, his book should attract attention. It should not be long before more is heard of the impedance relay system of protection in this country.

BRITISH WOOD PRESERVING ASSOCIATION.

Co-operation for Study of Problems—Encouragement of Use of Home Grown Timber—Need of Fundamental Research—Improved Methods Required.

IN view of the increasing scarcity of wood, the rapid deterioration which affects certain wooden structures and so on, an influential committee has been formed by Sir Harold Boulton, Sir James Calder, Lord Clinton, Mr. Leslie S. Wood and others to start an association for co-operation and research in the matter of wood preservation. Temporary offices have been secured at 166, Piccadilly, W.1.

An inaugural meeting was held in December last, at which the reasons for the formation of such an association were explained and ideas for the future discussed.

Mr. Leslie Wood said it is intended to study preservation in general, and not to boost any particular branch, to draw together those interested, to exchange views, and develop the better and more widespread use of methods likely to benefit the whole country. In America, there is a very useful and energetic society with a large membership already at work. At present, in many country districts, one has to go so far to get preserved timber, or timber has to go so far to be preserved, that the whole subject is almost banished from many parts.

The public should be educated regarding the advantages of the use of wood preservatives, and the large amount of timber in use which is rapidly rotting away.

It is probable that the Association will encourage the use of English-grown timber, which, in the absence of preservation facilities, cannot be used for outdoor work; there is excellent spruce which might thus be used for posts and rails, and so on.

Sir Harold Boulton said that originally the Association of Tar Distillers had been formed, but it was considered that the subject went beyond the scope of some particular trade section.

National Importance.

The national importance of the subject made it desirable to invite representatives of the Admiralty, the Post Office, the Association of British Chemical Manufacturers, the Timber Trade Federation, and lastly, the Institution of Civil Engineers, which body has taken a great interest in the subject for 70 years. The objects of the Association were given, namely: (*a*) To spread knowledge of wood preservation, to prevent waste, and standardise specifications for wood preservatives and their application; (*b*) To investigate *all possible* methods of wood preservation, and discussion of ideas on the subject.

As a means to these ends, it was decided, *inter alia*, to hold meetings at various places, to co-operate with other organisations, to encourage the use of treated wood, to publish information, and to carry out and promote research. The Association does not wish to limit itself to creosote. Only 20 years ago he (Sir Harold Boulton) had persuaded the Canadian Railways to prevent appalling loss by creosoting timber sleepers; a way had been found of treating Douglas Fir.

Sir James Calder said that in America the Wood Preservers' Association had been very active; timber is increasing in price, and the need for the preservation of timber increases *pro rata* as the price of raw material increases. It is interesting that wood used 40 or 50 years ago seems, without preservation, to last much better than the wood used to-day; there is much wood rot going on.

Lord Clinton, formerly of the Forestry Commission, said that in his view what was wanted was fundamental research, in which the Forestry Products Board was also interested. Preservation of timber will not prevent the cutting of young trees for fencing and other such purposes, as to promote the health of plantations thinning is necessary, but treatment of such young timber, without rehandling, would increase marketability. Treatment should make certain unpopular wood available for commerce. At present, treatment has the effect of weakening timber; that result may be due to wrong methods, which research may obviate.

Mr. Herbert Fergusson said that in his early days he was struck by the enormous waste that was going on for want of knowledge regarding preservation. Soft wood could take the place of valuable hard wood for sleepers in some countries.

Mr. Ward, of the Post Office, said his department was distributing millions of poles round the country; it would be difficult for it to join such an association. The creosoting process had given good results for 40 to 50 years, the Rüping method of application being now used. Other methods tried had not been so satisfactory; either the acids or poisons used got into wells or ponds used by cattle, or ironwork, was attacked.

Mr. C. J. Brown (L.N.E.R., Engineers' Dept.), said the larger railway companies would welcome anything which would open additional sources of supplies or lengthen the life of sleepers. The railways were about the largest users of timber in the country.

Mr. C. Le Maistre, of the British Engineering Standards Association, was glad to see from the formation of the Association a spirit of co-operation in industry, without which standardisation cannot go forward. By means of standardisation, consumers can give orders and compare tenders with confidence, waste can be minimised, and work done for stock during slack times.

Sir Peter Clutterbuck said that in view of the coming shortage of soft wood supplies, increasing the life of wood by preservation was equivalent to increasing the supplies. The Forestry Commission is planting large areas; later on, quantities of thinnings wood will be available, and it was desirable to find some means of local treatment by which it could become marketable; such a result would have great effect on the financial results of the Forestry Commission. Power companies say they cannot have cheap distribution of power unless they can have some cheap system of supply of poles. They cannot afford the imported redwood pole properly creosoted, as used for telegraph poles. If the new association can bring together the demand for cheaper rural electricity and a marketable use for poles and thinnings, the Association will have done good work.

A great deal of research is required; for example, preservation methods suitable for poles or outdoor work are not good for work to be painted. Kiln drying has a preservative effect, the taking out of the sap removes the food for fungi.

Mr. Bryan mentioned the work being done at the Forest Products Research Laboratory at Princes Risborough.

Sir G. Courthorpe, Bart., M.P., said one of the chief handicaps to the use of home-grown timber, as compared with that imported, was the readier access of the latter to preserving plants; improved methods would, therefore, be of great service. It was decided to invite the co-operation of allied bodies.

At a meeting held on January 15th a draft constitution of the new association was discussed, and it was decided, *inter alia*, to make the question of wood fireproofing—a matter of interest to electrical engineers—one of the questions for investigation.

LIFE OF CEDAR POLES.

Experience in Eastern United States.

By A. C. SIMPSON.

RECENTLY an electric company in the Eastern United States desired to ascertain the experience it was having with cedar poles installed on its system. An estimate was made based on the inspection of a representative sample. The sample was taken from the original cedar poles which were placed in service during 1918 and 1919. Of 324 poles set in this period, 190 or 58·7% were inspected, an excellent sample in respect to adequacy. These poles were located in a territory comprising 110 sq. miles, with a great diversity of soil conditions—such as wet, sandy, rocky, loam and clay; combinations of each were also encountered.

It is believed that the results obtained are accurate because—

1. The sampling employed is representative to a high degree in respect to randomness and adequacy.

2. The poles inspected have actually been in service nine years, which approximates 33% of the average life, confining the operation of the law of probability to 66% of the total estimate.

3. The accuracy of the estimate of the remaining 66% is dependent upon the experience of an employee who has been with the company for fifteen years as a lineman and pole inspector. In this connection, it is suggested that the estimate might lean toward conservatism due to the nature of

Digitized by Google

this man's training, a training which tends to make him feel personally responsible for the safe condition of the poles.

An inspection and chemical analysis of ten samples of soil taken from as many diversified pole locations indicated various quantities of silica, iron oxide and organic matter, none of which should have a detrimental effect upon the life of poles. Each pole had received " AA " butt treatment.

Tables 1 and 2 show the results of the inspection and life under various soil conditions, according to pole classifications.

Of the 190 poles inspected, 106 or 55·8% showed no signs of decay; 49 or 25·8% showed various stages of decay from 1% to 10% reduction of pole in area at ground line. The remaining 35 or 18·4% showed a reduction in area at the ground line in excess of 10%.

From the foregoing material, it may be said that the results obtained are an indication of satisfactory experience.

ADVANTAGES OF CEDAR POLES.

Price the Drawback in Great Britain.

MR. G. W. Molle, of Messrs. A. Hugh Seabrook and Partners, who has interested himself in the possibility of using cedar poles in this country, informs us that the supply of Western Red Cedar is confined to a belt of country running roughly along the eastern side of the Rockies and divided roughly half on the Canadian side and half on the American side of the border. An American overhead line engineer, who was over here recently, said that this class of timber is rapidly replacing all others for use as wooden poles for overhead line construction in the United States. This also applies to Canada.

Mr. Molle adds :—" The remarkable characteristics of the Red Cedar pole, which make it most suitable for overhead line work are that it can be obtained in lengths even exceeding those usually required for this work, being as straight and clean as a lead pencil, and it is practically unaffected by conditions of soil or weather. Western Red Cedar trees have been known to lie on the ground for centuries without rotting.

" In regard to the price at which it is would be possible to obtain these poles in this country there unfortunately appears to be no possibility of obtaining them at less than twice the price of Scandinavian timber. The chief reason for this is, of course, the cost of transport from Vancouver to this country. Scandinavian timber is now being supplied to the eastern States of America for overhead line construction purposes. The only apparent reason for this is the very high cost of transporting cedar poles from the Western areas to the Eastern. It is, in fact, the practice to ship timber from Western Canada through the Panama Canal for delivery to Europe or to the eastern States of the American Continent, rather than send it across country by rail owing to the very high rail freight charges.

" For anybody seriously interested in Canadian timber a vast amount of information is available at the Imperial Institute, whose experts are only too pleased to assist in any way."

A CONCRETE POST WORKS IN FRANCE.

GYRO COMPASS FOR GUN-FIRE CONTROL.*

"North Steaming" and "Damping" Errors—Firing During Obscurations of Target—Tests of the "Static" Compass—Errors on Cargo Vessels—Gyro Compass for Aeroplanes.

GYRO compasses for ordinary navigational purposes are now fairly reliable and can be relied upon when in good order to give a reading, say, within 1° of True North. On the other hand gyro compasses for ships of war are not so satisfactory from the fact that the compass is required not so much for navigating the vessel as for supplying a datum line for gun fire and for launching torpedoes, particularly as the ships may be surrounded by a smoke screen, when the only means of determining direction is from the instruments that can be carried on board. Moreover, the warship would most likely be manœuvring when firing is taking place and this would put the greatest strain upon the accuracy of the compass, particularly at a time when it is required to be the least disturbed.

Oscillating Period.

The "North Steaming Error" is the worst error that a gyro compass has to contend against. This error is due to the angular motion impressed upon the gyro when the ship is steaming over the curved surface of the ocean; it does not exist when sailing east to west, because this angular motion simply adds to or subtracts from the angular motion of the earth, but when the ship sails north or south the ship's motion is at 90° to that of the earth and the gyro compass moves to indicate the resultant of these two angular velocities. The compass can be made to execute this movement only by giving it an undamped oscillating period of 88 minutes in this latitude, and as the error must obviously be corrected the real speed of the ship over the floor of the ocean must be accurately known. We have no instruments at present that will tell the true speed of the ship, and therefore, the correction can only be approximate.

As every gyro compass is damped in its oscillations a further disturbance will arise called the "Damping Error" unless there is some means provided to allow the compass to make the turn in an undamped condition. The "Brown" gyro compass is alone supplied with a device which when the ship turns automatically obstructs the flow of oil in the damping bottles until the turn is completed, when the pipe is reopened by hand or by automatic means.

A gyro compass for gun fire control must have an accuracy far in excess of that which is needed for purely navigational purposes. The sighting telescope of the gun fire control apparatus is directed towards the target, and this direction is telegraphed to the gun positions. The gun layer has only to direct his weapon in the direction given on the repeater. This is most conveniently secured by a special form of repeater whereby gun and telescope are both made to point to the same reading on the repeater dial. If the target is always visible the dial can be a fixed one, but if the target is occasionally obscured the guns can continue to fire during obscuration provided the dial of the repeater is coupled so as to be moved by a gyro compass on board, in order that its direction could be unalterably maintained during the times when visibility failed; this, I understand, is roughly the arrangement that is employed on British ships at the present time.

If the procedure just outlined was the only requirement for gun fire the navigational gyro compass would be fairly satisfactory, but the present gyro compass would fail if the time of obscuration of the target lasted over much longer intervals of time. The problem thus becomes still more difficult and to meet it the gyroscopic direction apparatus on board should possess the following characteristics: (1) It should maintain a fixed direction in space, or if it should wander, it should wander very slowly, say, not over 1° per hour, and at a known constant rate. (2) Its departure from the True North direction should be accurately known (say, within 10 ft.) (3) The motion of the ship should have no action whatsoever upon the compass. These requirements cannot be supplied by the present day North Seeking (navigational) Compass, which is most certainly affected by the motion of the ship. I have developed gyroscopic direction apparatus in an attempt to meet the requirements of gun fire in an instrument that is called a "Static" gyro compass. This "Static" has a gyro wheel and case in strict neutral balance. The wheel weighs some 5 lb. and runs at 15,000 r.p.m. As this instrument is in strict neutral equilibrium it cannot be acted upon by the rotation of the earth. It is, therefore, not "North Seeking." It is also unaffected by any motion whatsoever of the ship.

Under trial the "Static" compass has given remarkable results. Some two and a half years ago on H.M.S. "Thisbe," a destroyer, during a week's trial, the "Static" did not wander more than about 1° for the whole of the ten hours run day, and this wander was always in the same direction and could have been cut down if an opportunity had occurred, but it was a condition of the trials that no adjustments whatsoever should be made during the time that the compass was under test. Although the "Static" did not wander more than 1° per ten hours the rate of wander as the ship altered its course varied slightly and this variation was at first a little puzzling. In our latitude of 50° a suitable weight has to be placed upon the north end of the gyroscope to cause it to precess into the meridian at about 12° an hour; the compass then remains stationary as viewed from the earth.

If the ship sails towards the east or west the apparent speed of the earth is increased or decreased accordingly and the weight on the north end is thus too light or too heavy to keep the gyroscope stationary, and the compass would appear to wander accordingly. For instance, if the ship sails 20 knots towards the east the compass will wander towards the east at about 0·4° per hour. To overcome this defect I employ a repeater that moves a slider over a resistance so that an electrical current can be sent and varied to move a suitable weight on the compass. When the ship has an easterly or westerly component the movement of the weight attempts to precess the gyroscope in the opposite direction, and thus balances out the error.

On some cargo carrying steamers permanent errors from 1° to 2° have occurred when shortly before no error existed in the gyro compass. This has been proved in some cases to have been due to the discharge of cargo which has given a combined tilt and list to the ship and to the compass mounting. If after such a discharge of cargo the fore and aft gimbal mountings were tested for horizontality and if out of level, put right, the error would be eliminated. This permanent error that can be brought in by an unsymmetrical discharge of cargo, would also affect the readings of the standard magnetic compass and could be corrected in a similar manner.

It is fairly safe to say that in the future the eyes of the fleet will be the aeroplanes, but to allow these aeroplanes to direct the gun fire a "Static" gyro compass must be carried. I have developed such a device which has given remarkably good results. The gyro wheel is 4¼ in. in diameter and runs on a flexible spindle at 11 000 r.p.m., by means of a 12 V direct current motor spinning the wheel by means of direct current saves the weight of the usual 3-phase motor generator. The total weight of the instrument is some 15 lb.

Both in the aeroplane and in the torpedo the gyro must of necessity be a "Static" and thus subject to the laws of the "Static" compass, because the direction of gravity as a means of control cannot be brought in.

Small Deviation.

For accurate gun fire the guns must be elevated to a known amount above the horizontal at the moment of firing. Usually the horizon is taken as the datum line, but as this may very easily be obscured during an action an artificial horizon must take its place. For this purpose I have invented an instrument which has given good results. Under stationary conditions the mirror has been proved to be strictly horizontal and under extreme disturbance of rolling and pitching on a rolling table normally used for testing gyro compasses, its deviation has been shown to be no greater than, say, 4 minutes of arc. It has already been stated the gyro apparatus for giving direction for gun fire must of necessity give extreme accuracy of direction if the instruments are to be of any practical value; this we believe can be secured by the present design of apparatus where extreme freedom of movement is maintained in the vertical and horizontal axis of support and when the instruments are of superlative workmanship. The solution does not rest, I am assured, in any further alteration of design.

* From a lecture given by Mr. S. G. Brown, M.I.E.E., F.R.S., at the Imperial College of Science and Technology, South Kensington, before the Physical and Optical Societies, on January 8th.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Government Policy and British Trade.

[To the Editor.]

Sir,—It is impossible not to be seriously concerned at the effect on industry of current or projected legislation and of our continually increasing national and municipal expenditure. The root cause of our present difficulties lies in our inability to produce important classes of manufactured goods at competitive prices.

For the explanation of this, we have to look to three main causes: (*a*) our unparalleled burden of taxation (municipal expenditure is double the 1913-14 total, and, at the present rate of increase, we are well on the way to the £1 000 000 000 Budget); (*b*) our rivals' vantage ground of secured home markets from which they compete with us for export trade; and (*c*) the greater freedom of our competitors from Government interference in their businesses.

Instead of practising economy, our Government is indulging in a riot of spending. We are promised the extension of the school age, with maintenance allowance, to children over 14, at a total extra cost in 1930 of £5 500 000; non-contributory pensions for about half-a-million widows, at a cost of £5 000 000, and an Unemployment Insurance Bill, which places on the Labour Exchanges the impossible task of proving that applicants are not genuinely seeking work (extra cost, £3 500 000).

On the fiscal side, the Government threatens to scrap our few equalising import duties and is endeavouring to bring about a two years' tariff holiday, which will prevent us from doing anything to reduce our competitive disadvantages or to develop our trade by an extension of Empire preference.

By way of interference in our factories, we are promised the ratification of the Washington Eight Hours Convention (with liberty to our competitors to admit all manner of exceptions), a Coal Mines Bill which will increase the cost of coal for our manufacturers, and—to add to the expenses and difficulties of factory managers—a new and more stringent Factories Bill.

The Government spokesmen even claim it as a merit that there is no finality in these measures, so that the only limit to the continued extension of so-called social services is the amount which can be extracted from the taxpayers.

If, on balance, all this was to benefit the workers, there would be something to set off on the credit side, but there is already evidence of the harm it is doing them. Since the Government came into office the cost of living index has been steadily going up, and the unemployed register shows 1 500 000 workers walking the streets as against 1 100 000 in June. Our staple industries are declining, our manufacturers are losing that confidence in the future which can alone justify them in undertaking new enterprises; numbers of skilled artisans—who, even when in work are not able to command the wages or the steady employment of unskilled men in sheltered industries—are losing their skill for want of practice.

The nation is at the parting of the ways, and unless we can retrace our steps and foster enterprise and independence on the part of employers and workers, and encourage thrift—in other words, unless we can get away from the mentality of the Minister of Health, who, like all spendthrifts, is of opinion that "whether a nation can afford a thing depends on how much it wants it"—this country, with all its great traditions, will sink financially, industrially and politically to the level of a second-rate power.—Yours faithfully,

J. A. Corcoran,
Director National Union of Manufacturers.

6, Holborn Viaduct, E.C.1.
January 24th.

Coal Mines Bill.

[To the Editor.]

Sir,—Some amendment of the provisions of the Coal Mines Bill, to secure equitable treatment of electricity supply undertakings, seems necessary. The Bill in its present form would establish a monopoly in the sale of coal without adequate safeguards against undue preference.

The various uses of coal in this country are in many respects alternatives to one another, and those engaged in the sale of coal and of other forms of energy produced from it are competitors. For example, domestic requirements for lighting, heating and cooking may be supplied by the burning of coal or by the use of coal gas or of electricity. The colliery owners are concerned directly with the sale of domestic coal in competition with electricity supply undertakings, and it will be open to colliery owners (indeed, an intention to do so has already been indicated) to offer domestic coal at a preferential price so as to encourage its greater use in place of gas and electricity. Similarly, it has been suggested that the colliery owners might assist depressed industries by giving a preferential price and reimburse themselves by charging an extra price to prosperous ones.

It is submitted that, in the public interest, the regulation of this proposed monopoly should be subject to the usual safeguards as to limitation of profits, prescription of maximum prices and prevention of undue preference to any class of consumer. Provisions of this nature are contained in the legislation regulating the supply of water, gas and electricity under statutory powers, and there would seem to be the fullest justification for amending the Bill to make similar provisions in respect of the sale of coal in this country.

Statutory electricity supply undertakings are already seriously handicapped in relation to private power plants by the preference given to the latter in respect of rating; if they are also to be required to pay an extra price for coal there is no doubt that their development would be seriously hindered and the objects of the national electricity scheme made more difficult, if not impossible, of attainment.

The Bill should be amended to make clear that the pithead price of any class of coal for home consumption shall be fixed without regard to the purpose of use, and on a basis which does not discriminate unfairly between statutory public utility undertakings and other users.—I am, etc.,

W. B. Woodhouse.

Leeds,
January 28th.

Technical Abbreviations.

[To the Editor.]

Sir,—I recently came across a criticism of a new technical dictionary in regard to the abbreviations therein employed.

The dictionary gives k.w.h, whereas the standard practice is kWh. I should be inclined to use KWH as being neater, simpler, more uniform, and less liable to cause confusion. When writing kWh, the standard way, a certain amount of reflection is generally necessary.

Now what advantages can the standardisers put forward to justify the above disadvantages? Even if "kilo" is regarded as of secondary importance as compared with "Watt" (which is debatable), surely Hour is worth as much as Watt. The Germans have adopted the same hair-splitting tactics, but they have even less "leg to stand on," since hour is a noun and should be written by them with a capital H.

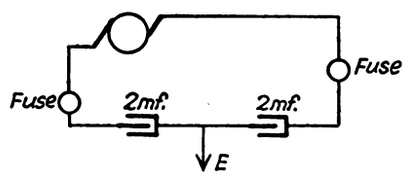
Let us change our standards.—I am, etc.,

H. H.

Generator Interference with Wireless.

[To the Editor.]

Sir,—In reply to "Q's" letter in your issue of January 10th regarding generator interference with wireless, a method I have used with success on many occasions is to put condensers



across the brushes as you suggested, but putting two in series and earthing the middle point. Insertion of fuses in the circuit for safety is advisable.—I am, etc.,

NEWS IN BRIEF.

Electrical Contractors' Conference—Electricity on American Farms—Electric Power in Northumberland Coal Mines—New Chili Telephone Concession.

SANDBACH U.D.C. has decided to adopt electric lighting at the Town Hall.

Owing to the success of the Manchester police telephone boxes, 11 police stations have been closed.

Hired electric cookers connected to the Manchester Corporation mains in November last numbered 73, making the total 5 774.

Alterations and extensions to Chester Corporation's electricity showrooms in Northgate Street, are proposed. Mr. F. C. Saxon, F.R.I.B.A., is to be asked to prepare plans.

H.M. Office of Works, etc., invites tenders for the erection of a telephone exchange at Purley, Surrey.

This year's annual conference of the Electrical Contractors' Association will be held at Llandudno on June 25th, 26th and 27th.

New showrooms in West Street in connection with Bromley Corporation's electricity department, were opened on January 23rd. Cooker demonstrations are given daily.

The dinner of the Finsbury Technical College Old Students' Association will take place at the "Trocadero," London, on March 29th. Mr. F. R. C. Rouse, Venner Time Switches, Ltd., London, will supply any further particulars.

Members of the North Midland Students' Section of the Institution of Electrical Engineers will visit the works of Karrier Motors, St. Thomas' Road, Huddersfield, tomorrow (February 1st). Members will meet outside the works between 2.30 and 2.45 p.m.

Poplar (London) Board of Guardians is to take h.t. supply for the High Street institution. The work of connecting will be carried out by the B.C. at an estimated cost of between £1 200 and £1 500.

The South African Railways Administration has decided to call for tenders for an 80-ton heavy lift crane, a 25-ton floating crane and such additional electric cranes as may be necessary to deal with the traffic at the Point, Durban.

At a meeting of the Institution of Electrical Engineers, Western Centre, in the Abbey Hall, Catherine Street, Plymouth, on February 3rd, at 7 p.m., Captain P. Eckersley will deliver his Faraday Lecture on "Broadcasting by Electric Waves."

The power bill for making 120 tons of silage has been reduced about $35 by the use of electricity on an Oklahoma farm, according to "Capper's Farmer." Last year the electricity for cutting the silage cost between five and six dollars. Previously a steam engine hired to pull the cutter cost $40.

At a recent meeting of the Leeds Radio Society it was resolved to form a branch of the Television Society, to work in conjunction with the Leeds Radio Society. It was stated that if a strong society were formed, the Baird Television Co. would loan a televisor. The next meeting of the Leeds Radio Society will be held at the University to-day (January 31st).

The Electroplaters' and Depositors' Technical Society will hold a convention to-day (Friday), at 2 p.m., when Dr. W. Rosenhain will give an address entitled "Research and Practice," and a discussion entitled "The Present Position of Chromium Plating" will be opened. An exhibition has also been arranged.

Mr. R. Pryce-Jones, stated in a recent address to the North-Western Students' Section of the Institution of Electrical Engineers, that most of the improvements in industry during the last few years had been due to the extended use of cranes. There were many industries where a suitably designed electric crane would be an improvement on steam cranes.

Cyclists and drivers of vehicles have been fined at Edinburgh for ignoring automatic road-traffic signals.

Brighton Hospital Committee is about to have electricity installed at the Beechmont hospital at a cost of £460.

Schemes have been submitted by several firms of Glasgow architects for the reconstruction of the premises of Glasgow electricity department.

"The Art of Stage Lighting" was the title of a paper read before the Illuminating Engineering Society on January 21st, by Mr. C. Harold Ridge.

LOOKING BACKWARD.

FIFTY years ago, THE ELECTRICIAN *of January 31st, 1880, quoted a lecturer's estimate that there were then 40 000 telephones in use in America and only about 800 in England.*

Tenders were invited for the electrical lighting of the London and St. Katherine Docks.

Much scepticism was still current as to the success of Edison's lamp as a commercially practical means of illumination.

* * *

FIFTEEN years ago, in THE ELECTRICIAN *of January 29th, 1915, the issue of the first number of the B.E.A.M.A. house journal was recorded.*

Owing to difficulty in obtaining a supply of carbons, the Willesden Electricity Committee proposed to convert as many as possible of the arc lamps in use to metal filament lamps.

* * *

TEN years ago, THE ELECTRICIAN *of January 30th, 1920, was calling attention to the harm done to the industry by unsuitable and inferior wiring and apparatus.*

Registration of the British Electrical Development Association as a company limited by guarantee, but not working for profit, was recorded.

A radio exhibition will be held at Tokyo from March 20th to April 18th. The Department of Overseas Trade, London, will supply further details.

The annual dinner of the Birmingham Electric Club will take place on March 14th. The hon. secretary is Mr. J. H. Asdell, 134, Grove Road, King's Heath.

The N.J.C. for the Electrical Contracting Industry has conceded advances of wages from 1s. 10½d. to 1s. 11d. in London (grade A), 1s. 7½d. to 1s. 7¾d. in provinces (grade B), 1s. 5¾d. to 1s. 6½d. in urban areas (grade C), and 1s. 4½d. to 1s. 4¾d. in rural areas (grade D).

A conversazione with exhibits, supper and dance will be given by the Overhead Lines Association on February 24th, at the Georgian Restaurant, Harrods, Ltd., Knightsbridge, London. Tickets (12s. 6d. each) can be obtained from Mr. W. T. Andrews, 14, Violet Road, London, E.3.

In a recent lecture at the Mechanics' Institute, Wakefield, Lt.-Col. V. A. Haddick said an important factor in the increase of Ireland's agricultural productivity would be the Shannon electricity scheme.

The Cowpen Coal Co. is to substitute electricity for steam power and compressed air at its pit in the Blyth area. Electric machines have already been introduced at Crofton Mill, Cambois and Isabella pits; electrically driven ventilating plant has been put into operation at Cowpen colliery and the steam driven plant at South Newsham is to be abolished.

The "American Agriculturist" contains an interesting story about a device for electrocuting flies. A special screen is connected with the lighting circuit through a special transformer, the screen is charged with electricity, and contact with it by flies and other insects "starts them on the long, long trail." During the summer months the equipment destroys as high as 2 500 flies per day.

Sir Felix Pole, chairman of Associated Electrical Industries, stated in the course of an address at the monthly luncheon of the American Chamber of Commerce in London, last week, that, in his opinion, American capital could prove of value if invested in British undertakings, provided it were clearly laid down that British trade and commerce should be benefited and not damaged by the influence which such investments were bound to possess.

The Chilian Senate has approved the new 50-year concession permitting the Chili Telephone Co., associated with the International Telephone and Telegraph Corporation, to penetrate throughout the country with its own lines and to connect the system with all other national operating systems. International service with the neighbouring republics of Argentina and Uruguay has been established, and a definite prospect now is opened for an extension to other territories served by the International System via the Buenos Ayres-Madrid radio link of the Compania Internacional de Radio (Chili). This new concession brings Chili within speaking distance of Europe.

ELECTRICAL CONTRACTORS' DINNER.

Problem of Loading the Grid—What a 5 Per Cent. Annual Increase in Houses Wired Would Mean—Need of Educating the Public—No Salvation from Politicians—Charges for Current and Cost of Apparatus—All-in Rates Required.

THERE was a record attendance at the annual dinner of the allied Electrical Contractors' Associations (E.C.A.I., N.E.C.T.A., Ltd., and N.F.E.A.) at the Savoy Hotel, on January 22nd, well over 300 members and guests being present. The president, Mr. H. Willoughby Ellis, was in the chair. Among the company were Sir John Brooke, Sir Andrew Duncan, Mr. V. Watlington, Mr. Ll. B. Atkinson, Mr. E. S. New, Mr. J. J. Foggo, Mr. P. Rosling, Mr. N. G. Gedye, Capt. J. M. Donaldson, Mr. F. W. Purse, Sir G. W. Humphrey, Mr. J. L. Brydges, Mr. H. Marryat, Mr. S. H. Callow, Mr. J. Wilson, Dr. J. W. T. Walsh, Mr. B. C. Garman, Miss C. Haslett, Mr. E. A. Reynolds, Mr. T. E. Alger, Mr. W. H. Walton, Mr. W. R. Rawlings, Mr. Walter Riggs, Lt.-Col. Cortez-Leigh, Lord Bective and Col. G. E. Adamson.

Progress of the Industry.

Sir John Brooke, proposing the toast of the "Allied Associations and Honorary Officials," said that it ought to be realised that the progress that was being made was not the inevitable march of events, but the result of hard work by everybody in the industry. They were all looking to great development of electrical supply and industry. Without such development the great national scheme which the Central Electricity Board was carrying to such a brilliant success would not be justified. That progress could not be made without an enormous effort, particularly on the part of members of these associations; the task was perhaps bigger than was generally realised. The estimated increase in the sale of electricity during the first five years upon which they were working was no less than 3 000 000 000 units. For the first two years of the period the estimated growth had been reached, indeed, they had done a little better, but there was still a long road to follow. Only 25 per cent. of our houses were electrified, In America the percentage was 66. An increase of only 5 per cent. each year meant 500 000 houses to be wired. Much more propaganda than was being carried on at present would be required to attain this rate of growth. He urged members of their associations to put a real push into the sale of electricity and stressed the need of educating the public. There was still much ignorance, but less than a year ago, particularly in regard to the necessity for the use of good materials and workmanship. The Commissioners were accused of making too stringent regulations. The only criticism that was useful was that which was directed to exact points, on which the regulations could be made better, and of that there was an extraordinary absence. In Sweden for various reasons they had started their wiring on an insufficient scale, and were now engaged in re-wiring to a much higher standard with the result that fire risks had been very much reduced. He hoped that the book which they had published for the benefit of architects was only a beginning, and that they were going on so that everyone could go to his contractor and get the best advice.

Mr. H. Willoughby Ellis, replying, said that the time had more than arrived when the parochial outlook must be compelled to recede farther and farther into the background. On the applied side the science and art of electricity had assumed the dimensions of a national problem, requiring the united attention of all practical electrical men. Since the matter had assumed national dimensions it was inevitable that they would have to endure the attention of the politicians, but he trusted that the business men of the industry would take charge in their own house and organise their industry on sound, enduring and non-political lines.

Owing to the exertions of the Electricity Board and the Electricity Commissioners (in this connection he was delighted to welcome Sir Andrew Duncan as chairman of the former and Sir John Brooke as representing the latter), they were fast approaching a national system of supply covering the greater bulk of the country. Their immediate problem was to see that the national supply scheme was provided with the necessary load to ensure its success. In reading the reports of the recent debate in the House of Commons on this matter, he failed utterly to discover any practical or helpful suggestions towards attaining the end in view. They did not nowadays look to politics for business. Appropriate and workable business suggestions must come from the practical men *within the industry itself*; these suggestions must be framed on considered business lines and not built upon some phantasy of proletarian social benefit.

These considerations were not local in character. They were the care of every section working together with one common end in view, and the common problem before them was to load the grid. They would see, of course, a gradual migration of industry from crowded centres of population into rural or semi-rural areas where it could be carried on under better and more healthful conditions. It was not difficult to visualise a fundamental change in their national habits and a reversal of the flow of the tide, whereby the towns might return to the status of residential areas, while the surrounding urban areas were given up on an ever-increasing scale to the requirements of manufacturing and general industry. Such a swing of the pendulum was something, perhaps, that they were doing on behalf of posterity, and their immediate concern was to know what they were doing on behalf of themselves. If they were to build up an immediate load for the national supply system, the immediate need was to tackle the domestic situation in *existing* supply areas, by arranging not only reasonably uniform charges up and down the country, but also genuinely economic charges calculated to attract and connect that vast domestic demand to the mains. The industrial power demand in this country was already substantially connected up. Future industrial demands would come on to the public mains practically automatically, but the possible and colossal domestic demand had been no more than scratched on the surface. In this matter nothing was more important than truly economic rates of supply. Given such rates, the immense advantages of electric heating and cooking would provide an irresistible appeal to the public, which they would find ways and means to gratify.

Let them avoid loading the price per unit with heavy charges calculated to ease the cost of equipment. The acquisition of electrical equipment must be made as reasonably easy as possible, but he claimed that it was wholly erroneous to suppose that apparatus must be given away, as it were, in order to persuade the public to use the service.

Such an attitude was to hitch up the horse by the side of the cart in "combination" style.

They heard talk from time to time of "decorating and furnishing with electric lighting," but they must go a step farther and talk of "decorating and furnishing with electricity." Let them remember the immense sums expended annually on ordinary domestic furniture and hangings. What would the industry give to secure the national expenditure of one-half of this sum on electrical apparatus? Was ordinary furniture "given away"? On so-called "attractive hire-purchase terms," was it not a fact that ordinary domestic furniture carried a manufacturer's and dealer's profit beyond the wildest dreams of any electrical trader? Why were other trades permitted to earn these profits, while electrical traders—manufacturers, wholesalers and contractors alike—were expected to work for next to nothing?

Domestic Equipment.

The electrical point of view was inclined to be far too timorous. Some of them had been much too anxious to boost the domestic use of electricity at a time when general supply rates were not low enough to give the proposal a sound economic basis. They tried to put the cart before the horse, and in some electrical minds, even to-day, the same eccentric process was busily at work. He was prepared to take this matter a step farther. Much of the flimsy electrical apparatus of to-day would not do and they must get back to solid, enduring and trouble-free equipment, and this type of equipment could not be given away with the proverbial pound of tea. The domestic installation of the future must also be much more solid and comprehensive than it had been in the past. The plug outlet question was of vital importance. It was not enough to have one 15 ampere outlet to each room for large apparatus; simple ways and means must be found to provide alternative and lightly fused sockets for all the small apparatus that might be required in each principal room.

All-in rates must be provided and the higher charges generally applicable for lighting only must be abolished. These

Continued on page 146.)

Digitized by Google

rates, originally adopted to enable suppliers to deal adequately with a peak load, were becoming less and less applicable owing to the vast increase of industrial requirements during the daytime. Naturally supply authorities were not inclined to reduce these high rates, but the time was not far distant when this would have to be done. It muddled and confused the whole proposition to have some sockets supplying current at one rate for one purpose and other sockets supplying current at a different rate for other purposes. From the point of view of the public the whole thing savoured of a stupid and pointless wangle.

Need of Education.

In the electrical education of the public he saw room for the very fruitful expenditure of all the electrical money they could spare. Tens of thousands of houses were using their 60 units per quarter for lighting, when, with adequate development, they would be consuming 600 units as a minimum requirement. But impressive results would never be attained without economic rates followed up by an immense educational effort. In the schools—the higher girls' schools and training colleges, every other scheme of domestic heating and cooking was handsomely represented, electrical equipment alone, in the majority of cases, being conspicuous by its absence.

Was it not vitally necessary for the best brains in the industry, not outsiders, to pool their experience and ability in order to achieve a substantial measure of immediate reform? The need for all sections of the electrical industry to come more closely together in some central "Council of the Industry" was daily becoming increasingly apparent. The man or organisation that succeeded in welding their great industry into one coherent and co-operative whole would deserve uncommonly well, both of his contemporaries and of posterity.

Mr. H. J. Miles, proposing the toast of "The Guests," said that he took the presence of representatives of nearly everybody connected with the industry to mean that they intended to work together for the good of the industry as a whole. In Brighton they had very nearly achieved the percentage of houses wired that had been reached in America.

Mr. F. W. Purse (London and Home Counties Joint Electricity Authority, which he paraphrased as Light, Heat and Cooking Juice Advocates) and Mr. V. Watlington (chairman of B.E.A.M.A.) responded. Mr. Purse referred to Section 48 of the 1926 Act, and said that it was suggested when it was included in the Act that it sounded the death-knell of electrical contractors. This had proved to be entirely wrong. It had brought many thousands of pounds' worth of work to contractors, and had added many thousands of new consumers to the supply undertakings. It was now recognised that municipal and private undertakings could go on together and that good would result.

Co-operative Effort.

Mr. Watlington said that they were beginning to achieve co-operation in the electrical industry, and this was an object to be pursued with all their energies. They had reached a point when individualism alone would no longer serve as the only means of carrying on their industrial undertakings. If they were to reap the full benefit of the facilities for the sale of electricity, there must be no division in the electrical industry. Each part had its functions but they would make a great mistake if they thought they could stand alone. Industrial electrification was bound to come from necessity, but when it came to the ordinary man and woman, they had done very little to increase the use of electricity which was suffering from being dealt with too much from the engineering point of view. Women could play a large part in developing this field.

Mr. C. H. Flower proposed the toast of "Our Chairman," saying that the Associations had been very fortunate in their presidents and never more so than this year. The position involved attendance at an endless series of committees and meetings, and much travelling to all parts of the country, so that it imposed a great strain on a busy man's time. The toast was musically honoured.

REDUCTION OF CHARGES.

Many Reductions in Industrial and Domestic Tariffs for Electricity Supply.

THE following reduced charges for electricity have recently been adopted. Figures in parentheses represent the former rates:—*Seaham Harbour*, lighting, 6d. maximum to 4d. per kWh for 500 kWh and upwards per month; power, 3½d. and 3d., with special rates for over 100 kWh per month; heating and cooking, minimum 120 kWh per annum, 2d.; domestic, from 5s. to 10s. per month, according to rateable value, plus 1d. per kWh, for all purposes; shop-window lighting after hours, 15 kWh per week 5s.; increased quantities *pro rata*. *Dublin* (*Electricity Supply Board*), industrial power, first 3 000 kWh quarter, 2d. per kWh; next 2 000, 1½d.; further quantity 1d. *Taunton*, power, up to 4 000 kWh per quarter, 1¼d. per kWh; exceeding 4 000, 1d.; exceeding 32 000, ¾d. *Sutton Coldfield*, lighting, separately metered, under 750 kWh per quarter, 5d. per kWh; 751 to 2 000, 4½d. 2 001 and upwards, 4d.; contract rate, lighting and heating or cooking, 12½% of rateable value, plus 1d. per kWh; heating and cooking, up to 2 000 kWh per quarter, 1½d. per kWh, over 2 000, 1d.; industrial power from 1¾d. per kWh for under 500 kWh per quarter to 1d. per kWh for over 10 000. *Douglas*, late shop window lighting, 3d. (4d.) *Turton*, power for industrial purposes, first 300 kWh per quarter, 3d. per kWh; next 200, 2d.; all over 500, 1½d. (minimum £1 per annum); lighting 5½d. (minimum £1 per annum); heating, cooking, domestic motors, etc., first 25 kWh per quarter, 2d. per kWh, all over 25, 1d. per kWh. *Luton*, tramways supply, 15s. per quarter per kW of the plant reserved for tramway purposes, plus charge per kWh equal to the cost of fuel used per kWh generated, with an addition of 25% *Islington* (*London*), lighting, flat rate, 3¼d.; places of worship, public institutions, theatres, schools, etc., 2¾d.; power, heating and cooking, ⅞d., if consumption exceeds 50 000 kWh per quarter, discount of 10%. Special rate, with meter rent for restricted hour use, factory and industrial lighting. Advertisement sign lighting and shop window and garage lighting, 2d. *Hornsey*, lighting, 3¾d. (4d.) per kWh for first 500; *Sevenoaks and District Electricity Co.*, private lighting, 9d. (8d.), business premises, hotels, schools, etc., 7½d. net (9d. less 5%); hospitals, 8d., less 25% for payment within a month; heating, 1¾d. (2½d.); power 3¼d. per kWh for first 100 kWh per quarter, decreasing in stages to 1¼d. per kWh for all in excess of 2 200; domestic tariff, 1½d. (1¾d. and 2d.). *Heckmondwike*, lighting, 4d. (3d.). *Mirfield*, lighting 5d., domestic use 1¾d. *Yorkshire* (*West Riding*) *Electric Tramways Co.*, lighting, first 250 kWh per quarter, 6½d. per kWh, second, 250, 6d., beyond, 5½d.; heating, cooking and other domestic uses in conjunction with lighting, first 250 kWh per quarter, 1½d. per kWh, beyond, 1¼d. per kWh; small power, up to 15 H.P., first 250 kWh per quarter, 3½d. per kWh; beyond, 3d.; shop window advertising after closing hours, outside shop-window lighting, and outside signs, 2d., plus meter and time-switch rental. *Grays*, lighting, 6d. per kWh up to 100 kWh per quarter (up to 1 000), 5½d. per kWh for next 1 000, and 5d. beyond; power, up to 500 kWh per quarter, 2d. kWh (2½d.), next 3 500, 1¾d. (2d.); running charges in alternative two-part tariffs, 1¼d. (1½d.); cooking, through separate prepayment meter, 2d., rebate 2d. in shilling collected over the first 10s. *Bury St. Edmunds*, domestic rate where heating and cooking is installed, 1½d. less ½d. kWh discount for prompt payment. *Tunbridge Wells*, electricity for hot water boilers of 4½ gallons and upwards on separate meters, ¾d. in Tunbridge Wells and Southborough, and 1d. in other parts of area. *Bredbury and Romiley*, domestic power 1¼d. *Swanscombe and Stone* (*Kent Electric Power Co.*), lighting 6½d., power, heating and cooking, 2d. *Stratford-on-Avon Electricity Co.*, residential, inclusive rate 1d. per kWh, with fixed charges up to three rooms, summer quarters, 7s. 6d., winter quarters, 10s. 6d.; each additional room, 2s. 6d. and 3s. 6d. respectively alternative rates, heating and cooking, 1¼d.; lighting, 7d. for first 500 kWh per quarter, beyond, 6½d. per kWh; prepayment lighting, 8d., with rebate of 1d. per kWh in excess of 100 kWh per annum; business premises, first 90 kWh per quarter, 8d. per kWh, beyond, 2d.; power, 2d. per kWh for first 10 000 kWh per quarter, beyond, 1½d.; sign lighting, 3d. (minimum £5 per annum); lighting flat rate, 6½d.; prepayment meter supplies 7½d. with rebate of 1d. per kWh after first 100 kWh per annum. *Hastings*, general lighting, 4d., from 4 001 to 10 000 kWh per annum, 3¾d.; from 10 001 to 15 000, 3½d.; from 15 001 to 20 000, 3¼d.; beyond, 3d.; general lighting with slot meter, 5d., rental lighting with slot meter, 7d., including 2d. towards cost of installation; exterior lighting, 3d., shop window lighting after hours, 2d., outside decorative lighting, 2½d., arc or high c.p. lighting for professional photographic purposes, 2½d., cinema arc lighting, 1½d.; power, other than domestic, 1d.

THE "BLUE BOOK."

New Edition of Electrical Trades' Directory and Handbook.

ERNEST BENN, LTD., of Bouverie House, Fleet Street, London, have just issued the 48th (1930) edition of this unique work of reference for those engaged in the electrical and allied industries and for those requiring information relating to such industries. The book has again increased in size, no effort has been spared in making the lists of names complete and accurate, and the handbook section has been rearranged for the greater convenience of users. The British alphabetical section alone contains about 22 000 names and addresses which are of great utility for circularising purposes, and the volume also comprises an extensive British classified trades' division, which is extremely useful as a buyers' guide, and alphabetical and classified trades' sections relating to British dominions and colonies, the European continent, Asia and Africa, Central and South America and the United States of America, and is the only work giving such information regarding firms and persons engaged in electrical work throughout the world.

The geographical section, introduced two years ago, has been found of great service, and has again been considerably amplified. The list of telegraphic addresses also continues to be much appreciated. Other interesting features in the book are a complete list of electrical contractors, in which are specially indicated the entries of the names and addresses of firms who are on the National Register of Electrical Installation Contractors and/or members of the Electrical Contractors' Association and/or the Electrical Contractors' Association of Scotland.

The contents of the book also include a three-years' calendar, a revised digest of the law and procedure relating to patents, designs and trade marks, a conversion table to simplify calculations regarding weights, measures and electrical quantities, tables dealing with electrical equivalents of heat units, a comparison of British and metrical measurements of wires, resistances of wires of various diameters and resistances of various materials, the Imperial standard wire gauge, copper wire gauges, current-carrying capacities, resistances, etc., of cables of various sizes, characteristics of aluminium and steel cored aluminium conductors, electro-chemical equivalents, etc.

Other handbook features are the B.E.A.M.A. standardisation rules for electrical machinery, interest and sinking fund tables, abstracts of Colonial and foreign import tariffs, particulars of international telegraphs, including lengths, etc., of land lines and submarine cables, wireless developments, colleges and schools, Government departments, and electrical and engineering associations.

The book (which is published at 25s. net) continues to merit its reputation as an indispensable work of reference for those engaged in or associated with the electrical industry.

BUSINESS ITEMS.

THE L. N. Ericsson Telephone Co. in Stockholm has issued a report which shows that 70 Ericsson telephone exchanges are in operation or in course of construction in 16 different countries. The number of lines connected to these exchanges is 164 290, while 237 820 are in course of construction. The final capacity of these exchanges is 1 658 700 lines.

An order for complete boiler plant comprising boilers, air pre-heating equipment, pulverising plant and auxiliary machinery for the B'wana M'Kuba Copper Mines, South Africa, has been received by INTERNATIONAL COMBUSTION, LTD., Africa House, Kingsway, London, W.C.2. Most of the equipment will be manufactured at the Derby works. Another order is for a complete stoker-fired boiler plant for the Ryde pumping station of the Sydney Water Board, Australia.

In view of the recent fusion of merchandising interests between the Edison Swan Electric Co., Ltd., and the British Thomson-Houston Co., Ltd., the former announces that it has been found necessary to augment its organisation in the Liverpool district. For this reason on and from February 10th the present Liverpool branch office will be removed from 33/35, School Lane (the present address) to 16, South Castle Street, where large stocks of Royal Ediswan lamps, wiring accessories, Ediswan radio apparatus and Mazda valves will be held. A well-equipped showroom will display samples of B.T.H. lighting equipment, refrigerators, and Ediswan radio apparatus. The telephone number is Royal 5052, and the branch will be under the management of Mr. A. S. Wilson.

PERSONAL.

MRS. C. T. ALLAN, chairman of the South Wales and Monmouthshire branch of the Electrical Association for Women, is making good progress after her recent severe operation in a Cardiff nursing home.

The Council of the Institution of Electrical Engineers has made the ninth award of the Faraday Medal to Sir Ernest Rutherford, F.R.S.

Sir Ernest Rutherford who has been awarded the Faraday medal of the I.E.E.

At a meeting of the Southend-on-Sea Town Council on January 21st, Mr. Robert Birkett, late borough electrical engineer, was presented with an illuminated address in appreciation of his 24 years' service.

Mr. H. E. Blackiston, deputy borough electrical engineer of Bermondsey, has been appointed borough electrical engineer and transport manager at West Hartlepool at a total salary of £1 275 per annum. See page 153.

Mr. T. H. U. Aldridge is giving up his office of vice-president and general manager of the Shanghai Power Co., and is returning to England, where he will be associated with the American and Foreign Power Co.

Following on the taking over of the Dublin electricity undertaking by the Electricity Supply Board, Mr. Laurence J. Kettle, city electrical engineer, has retired, and Mr. W. Hahn has been appointed chief operation engineer, eastern district.

The following are the new officers of the Faraday House Old Students' Association for the current year :—PRESIDENT : Mr. S. B. Haslam ; VICE-PRESIDENT : J. A. Taylor ; MEMBERS OF COUNCIL : Messrs. W. R. C. Coode-Adams, G. W. Gray, G. A. B. Leishman, C. E. Prince, H. S. Selves, H. E. Webb.

A long-standing association between seafarers and the wireless service was acknowledged at the Candlemas Court of the Worshipful Company of Shipwrights when Mr. F. S. Hayburn, deputy managing director of the Marconi International Marine Communication Co., Ltd., was admitted a Freeman and Liveryman of the Shipwrights' Company, whose foundation dates back to 1260.

Mr. R. M. Longman was the recipient of a presentation made at the Leeds and County Liberal Club on Monday, at a complimentary concert and dance given in his honour. Mr. Longman is leaving the staff of the Yorkshire Electric Power Co., where for nearly nine years he has held the position of technical superintendent. He has been appointed chief assistant to Mr. S. E. Fedden, engineer of the Mid-East England Area of the Central Electricity Board. Mr. W. B. Woodhouse (engineer and manager) made the presentation on behalf of the staff, the gifts being a stop-watch and a large canteen of cutlery. Mr. Woodhouse was supported by Mr. J. J. H. Stansfield (secretary) and Mr. H. C. Fraser (superintendent of organisation).

Obituary.

MR. E. H. HORSTMANN, on January 27th, at Weston-super-Mare, where he had been spending the week-end with relations. Mr. Horstmann was secretary and joint managing director of the Horstmann Gear Co., Ltd., was well known throughout the electrical industry, was a Fellow of the Royal Society of Arts, and a Member of the British Horological Institute and also the Institution of Public Lighting Engineers.

PROFESSOR HUGH LONGBOURNE CALLENDAR, Professor of Physics, Imperial College of Science, South Kensington, on January 21st. aged 66 years. In 1893 he was appointed Professor of Physics at the McGill University, Montreal, and in the year following was elected a Fellow of the Royal Society, which awarded him the Rumford Medal in 1906. He returned to London in 1898 on his election to the Professorship of Physics at University College and was in 1901 appointed Professor of Physics at the Royal College of Science. Professor Callendar invented several forms of platinum thermometers and pyrometers for various heat researches and for standardising these instruments devised a special compensating resistance box. He also constructed an electrical apparatus which recorded variations of p.d., resistance, etc., to one part in ten thousand.

PLANT FOR EGYPT.

Important Contract Awarded to British Manufacturers.

THE Egyptian State Railway has placed with the Metropolitan-Vickers Electrical Co., Ltd., a contract for the complete equipment of a 5 000 kW generating station which is to be constructed at Gabbary, about a mile from Alexandria. The power house is to supply power for the railway workshops and also for public distribution in the district, including Alexandria. The equipment which is covered by the contract includes three turbo-alternator sets, boilers, superheaters and economisers, coal-handling plant, fans, pumps, pipework, etc., and also the necessary switchgear and transformers for linking up to an existing 3 300 V distribution system and for supply to the station auxiliaries. The turbo-alternator sets will be one of 2 500 kW and two of 1 250 kW capacity, generating at 6 600 V, the turbines operating with steam at 240 lb. per sq. in. gauge pressure superheated 250 deg. F. at the turbine stop valve. The steam-raising plant will consist of four Babcock and Wilcox water tube boilers with mechanical stokers, each boiler having a heating surface of 4 305 sq. ft.

It is of interest to note that the turbo-alternator sets are to be of the self-contained type developed by the Metropolitan Vickers Company, in which the turbine and condenser of each set are built as a combined unit and all the auxiliaries are driven from the set itself. These sets, the manufacturers state, have notable features of advantage over previously existing arrangements of power plant of small and medium capacity. They are remarkably compact and, requiring no basement or elaborate foundations, they make possible important savings in power-house construction. Running costs and attendance charges are also low due to high operative efficiency and extreme simplicity of control.

This type of power plant is one of the developments of recent years and has already achieved marked success, more than 80 sets having already been supplied by the Metropolitan-Vickers Company for municipal and industrial power houses at home and abroad and for installations on board ship.

LOADED SUBMARINE CABLES.

Their Importance in International Communications.

SUBMARINE cables already play an invaluable part in international communications, but until the advent in recent years of "loaded" cables the service was restricted. as far as telephone traffic is concerned, to short distances. "Loading," i.e., the artificial introduction of inductance in the cable, has not only enabled the speed of telegraphic transmission to be greatly increased, but has achieved a result even more far reaching and significant, viz., the transmission of the human voice over far greater distances than was possible with "unloaded" cables. Already, the distances spanned by submarine telephone cables are quite considerable. As development proceeds and experience accumulates the distances will assuredly grow, and it requires but little imagination to foresee the time when all the continents will be interlinked by a submarine telephone network.

Amongst the recent literature we have received is a volume which gives an account of the "loaded" submarine telephone and telegraph cables manufactured, and in most cases also laid, by SIEMENS BROTHERS AND CO., LTD., of Woolwich. The opening chapter deals with "loading" in a general way while successive chapters contain illustrated descriptions, supplemented by copious tabular matter, of coil-loaded and continuously-loaded telephone cables insulated with gutta-percha and paper respectively, and continuously-loaded gutta-percha insulated telegraph cables. A brief mathematical treatise on telephonic and telegraphic transmission is given in an appendix.

ARCHITECTURAL LIGHTING.

The intimate relationship between artificial light and architecture cannot be denied, since lighting undoubtedly assists in the expression of architecture. The E.L.M.A. Lighting Service Bureau has fully appreciated this fact, and to give architects the opportunity of becoming familiar with modern electric lighting, has inaugurated an architectural lighting department, of which Mr. R. Waldo Maitland, architect, is in charge. This department has collected much data in Great Britain, as well as in France and Germany, and this is presented from the architect's point of view in the latest handbook entitled "Architectural Lighting."

ISOLATING SWITCHES.

Oil-Immersed Switches and Circuit-Breakers for A.C. Circuits.

THE British Engineering Standards Association has just issued a revision of B.S.S. No. 116, which deals with oil-immersed isolating switches, oil-immersed switches, and oil-immersed circuit-breakers, the distinction between these classes of apparatus being defined by a statement to the effect that an isolating switch is intended only for interrupting a circuit when there is no load-current, a switch being suitable for breaking a load current, and a circuit-breaker being suitable for interrupting abnormal conditions such as that of short-circuit. In the preparation of this revision due regard has been given to similar work done in other countries, with a view to co-operation in international standardisation. The specification is intended to cover indoor circuit-breakers up to 33 000 V, and outdoor types up to 220 000 V. Useful appendices are included, giving notes on the care and maintenance of circuit-breakers, and also on the measurement of voltage and sphere-gaps.

Copies of the specification (No. 116–1929) may be obtained from the Publications Dept., British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 2s. 2d., post free.

TRADE PROTECTION.

Annual Meeting of the British Electrical Trade Protection Association.

AT the annual general meeting of the British Electrical Trade Protection Association, at Sentinel House, London, Major Hogan, of Messrs. Hogan and Wardrop, and Mr. Orgel, of Messrs. Superlamp, Ltd., were unanimously re-elected chairman and vice-chairman respectively.

The members of the Executive Committee were re-elected, with the addition of Mr. W. J. Miles, of Messrs. Beacon Electrical Co., and Mr. J. P. McKenzie, of Messrs. Sifam Electrical Instrument Co., Ltd., the former in place of Mr. T. Beadle, who had resigned. The Executive Committee now consists of Mr. A. Hunstone (Electrical Conduits, Ltd.), Mr. P. L. Dwyer (P. L. Dwyer and Co.), Mr. F. W. Evans (The National Electrical Supplies Co., Ltd.), Mr. F. J. Godden (J. Godden and Co.), Mr. W. J. Miles (Beacon Electrical Co.), Mr. J. P. McKenzie (Sifam Electrical Instrument Co., Ltd.).

The secretaries' report was most encouraging and the success of the Association is now beyond doubt. The Debt Recovery Department shows over 97% recovered of the gross accounts handed in to the Association for collection. The secretaries were congratulated at having achieved such an exceptionally high percentage, and members expressed great satisfaction with the service given and results obtained by the Association.

THE E.D.A. AND THE B.I.F.

Colour Scheme for the Electrical Section.

THE British Electrical Development Association is erecting a handsome octagonal kiosk in the centre of the Electrical Section, Stand No. 20 H/1, of the British Industries Fair, Castle Bromwich. At this kiosk visitors will be able to obtain full up-to-date information concerning the electrical facilities available at any part of the United Kingdom, and a staff will be in attendance continuously throughout the period of the Fair to deal with all electrical inquiries. In co-operation with the Electrical Section Advisory Committee and the Fair Management Committee, the Association has introduced a uniform colour scheme which has been adopted by practically all the firms exhibiting in the Electrical Section, and it is confidently anticipated that this colour scheme, consisting of red and buff, will give distinctiveness to, and add to the attractiveness of, the Electrical Section. In the course of the next week or two the E.D.A. will issue a "Guide to the Electrical Section."

The Committee of University College (London) has recently increased the annual value of the Goldsmid Engineering Entrance Scholarship from £40 to £50. The Scholarship is tenable for the three years required for a full course of study for the Engineering degree or diploma, both of which may be taken concurrently. The next award will be made on the results of an examination for which candidates must enter by March 12th. The Secretary will supply fuller particulars.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

INVERNESS CORPORATION.—Electric lighting work in connection with erection of public baths. Schedules, etc., from Mr. A. F. MacKenzie, town architect, Inverness.

ARMAGH COUNTY EDUCATION COMMITTEE, February 1st.—Electric lighting installation at Armagh New Public Elementary School. Plan and specification can be seen at the office of Mr. J. St. J. Phillips, 16, Donegall Square South, Belfast, or at the Education Offices, Armagh. Tender forms will be supplied.

Overhead Transmission Lines.

CENTRAL ELECTRICITY BOARD, February 1st.—Supply and erection of 33 000 V overhead transmission lines in South-East England. Specification (No. S.E.E.—S.L. 3) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CLUTTON GUARDIANS, February 1st–February 14th.—Installation of electrically-driven forehole pump at the Institution, Temple Cloud, near Bristol. Specification, etc., from Mr. J. Wayne-Morgan, 6, Church Road, Whitchurch, Cardiff, until February 1st; deposit £1.

ECCLES CORPORATION, February 3rd.—Electric light and power wiring at sewage disposal works, Patricroft. Specifications, etc., from the Borough Electrical Engineer; deposit £1 1s.

CARNARVON COUNTY COUNCIL, February 4th.—Electric light installations in Llandudno Junction C. School, Deniolen C. School, Deniolen Technical Centre, Glanwydden C. School, Llanaelhaiarn Schoolhouse and Penygroes Schoolhouse. Specifications can be seen at the schools.

COWES URBAN DISTRICT COUNCIL, February 4th.—Electrical equipment, including wiring, provision of fittings, etc.; and supply and erection of private generating plant at Northwood House, Cowes, Isle of Wight. Plan of building can be seen at the office of Mr. J. W. Webster, engineer and surveyor, Northwood House, Cowes.

BOOTLE CORPORATION, February 5th.—Twelve months' supply of electric lamps, etc. Forms of tender from the Borough Engineer.

ISLINGTON (LONDON) BOROUGH COUNCIL, February 5th.—Supply of steel tube street lamp columns, with c.i. bases and swan-neck fittings; also supply of lanterns each suitable for containing three 300 W or three 500 W gasfilled lamps. Specifications and tender forms from the Borough Electrical Engineer, 60, Eden Grove, Holloway, London, N.7.

KENSINGTON (LONDON) BOROUGH COUNCIL, February 6th.—Twelve months' supply of street lanterns, lamp fittings, glass and electrical goods, lamp columns, etc. Forms of tender from the town clerk, Mr. Horace Rapson, Town Hall, Kensington, W.8.

INVERNESS DISTRICT BOARD OF CONTROL, February 7th.—Rewiring of electrical installation at Inverness District Asylum. Specification from Mr. C. A. Grut, Electricity Offices, Waterloo Place, Inverness; deposit £2.

BASINGSTOKE CORPORATION, February 8th.—Supply and erection of two heavy oil engines, each coupled to 800 kW three-phase 50 cycle alternator; one set to be ready by September 15th, 1930, and the other by September 15th, 1931. Tenders may be for either set or both sets. Specifications, etc., from Mr. F. Swarbrick, borough electrical engineer, Electricity Works, Brook Street, Basingstoke; deposit £1 1s.

DARWEN EDUCATION COMMITTEE, February 8th.—Electric light installation in Avondale School. Specifications from the Borough Engineer.

SALFORD CORPORATION, February 8th.—Low tension, paper insulated, lead covered and armoured cable. Form of tender from the City Electrical Engineer, Electricity Department, Frederick Road, Salford.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 10th.—Six or 12 months' supply of electric lamps, lanterns, etc. Specifications, etc., from Mr. A. E. Darby, borough engineer, Town Hall, Cambridge Road, London, E.2.

LONDON MIDLAND AND SCOTTISH RAILWAY, NORTHERN COUNTIES COMMITTEE (IRELAND), February 10th.—Twelve months' supply of telegraph ironwork, wire, electric lamps and porous pots. Tender form (No. 26) from Mr. F. J. Martin, stores superintendent, York Road Station, Belfast, on prepayment of 6d.

PORTSMOUTH CORPORATION, February 10th.—Twelve months' supplies to the tramways department, including insulating materials, lamps and motor windings (section Q); overhead line materials (section R), etc. Specification and form of tender from Mr. B. Hall, general manager and engineer, Tramways Department, Guildhall, Portsmouth.

RUGBY RURAL DISTRICT COUNCIL, February 10th.—Electric lighting installations in connection with housing schemes: Wolston, 26 houses; Brandon, 12; London Road, Dunchurch, 16; Newton, 8; and Churchover, 12. Plans, etc., from the surveyor, Mr. J. E. Weeks, Temple Street, Rugby.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, February 11th.—Twelve months' supply of cables for street mains and services (tender form E.S.1); lamps (E.S.2), meters (E.S.3), creosoted cable protection boards (E.S.4); plywood meter boards and insulators (E.S.5); ironclad service cutouts (E.S.6); street lighting standards and electric fittings (E.S.7); and creosoted wood service tee boxes (E.S.8). Forms of tender from the Electrical Engineer, 37, High Street, Cheadle, Cheshire.

STOKE-ON-TRENT CORPORATION, February 12th.—Twelve months' supply of mains and cables (contract No. 3 002) and static transformers (contract No. 3 003). Specifications and forms of tender from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2 for each.

STOKE-ON-TRENT CORPORATION, February 12th.—Supply of an electric mail van (contract No. 3 001). Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

TORQUAY CORPORATION, February 15th.—Two water tube boilers, economisers, etc., for the electricity works. Specifications, etc., from the Borough Electrical Engineer and Manager; deposit £3 3s.

BLACKPOOL CORPORATION, February 17th.—Supply of electrical sundries, etc. Forms of tender and specifications from the Borough Treasurer, Town Hall, Blackpool. Stamped, addressed envelope to be sent.

EDMONTON GUARDIANS, February 17th.—Six months' supply of electric lamps, X-ray, light and massage requisites, etc. Forms of tender, etc., from the clerk, Mr. E. Ridley, Board Room, 77, Bridport Road, Edmonton, London, N.18. Stamped, addressed envelope to be sent.

HOLBORN (LONDON) BOROUGH COUNCIL, February 18th.—Twelve months' supply of electric lamps, etc. Specification, etc., from the Borough Engineer, Town Hall, High Holborn, London, W.C.1.

LEEDS CORPORATION, February 18th.—One year's supply of stores to the electricity department, including i.r. covered cables, mains boxes and fittings, jointing and insulating materials, fittings and sundries (section N). Forms of tender, etc., from Mr. C. Nelson Hefford, Electricity Department, 1, Whitehall Road, Leeds.

HULL CORPORATION, February 19th.—Supply of electricians' material, etc. Forms of tender from the City Engineer.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 26th.—Twelve months' supply of electric lighting sundries, insulated wires, ordinary and prepayment meters, insulating compound; h.t. and l.t., concentric, paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer, 85, Fulham Palace Road, London, W.6.

Overseas.

UNLESS otherwise stated particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1, *Note.—An asterisk denotes that local representation is, in practice, essential.*

DUNEDIN DRAINAGE AND SEWERAGE BOARD, February 1st.—Supply of two centrifugal or propeller pumps, with electric motors and accessories (contract No. 737). (Reference A.X. 8 961.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct-coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

Digitized by Google

MELBOURNE CITY COUNCIL, February 3rd.—Supply of paper insulated cables (specification No. 1 016). (Reference B.X. 6 077.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 3rd.—Supply of protector blocks (carbon and porcelain). (Reference B.X. 5 948.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 4th.—Friction disc saw, with electric motor, for cutting steel joists and rails (tender No. P.W. 3/46). (Reference A.X. 8 998.)

Fuses for New Zealand Government.

NEW ZEALAND POSTS AND TELEGRAPHS, February 5th.—Supply and delivery of indication alarm fuses. (Reference B.X. 5 947.)

INDIA STORE DEPARTMENT, February 5th.—Supply of 30 000 wood separators for train lighting cells. Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

SOUTH INDIAN RAILWAY CO., LTD., February 7th.—Supply of overhead electric travelling crane for car shed, in connection with Madras improvements. Specifications and forms of tender (5s.) from the Company's offices, 91, Petty France, Westminster, S.W.1.

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844).

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T., 151/2 025.) (Reference B.X. 5 955.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 13th.—Supply of electric tube butt welding set. (Reference B.X. 6 005.)

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, February 15th.—Supply of 1 771 metric tons of telegraph wire. (Reference A.X. 9 047.)

LOUIS TREICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of distribution system (poles, conductors, transformers, meters, sub-station equipment, etc.). (Reference B.X. 6 003.)

LOUIS TREICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of two 60 kW sets, comprising two boilers, one economiser, a steel chimney, two engines, two alternators, and accessories, or, alternatively, two 100 kW sets. (Reference A.X. 8 997.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (schedule C. 541). (Reference B.X. 5 940.)

CHILEAN STATE RAILWAYS, February 19th.—Supply of apparatus and material for a signalling service between Maipu and Cartagena stations and between San Fernando and Talca stations. (Reference A.X. 9 008.)

JOHANNESBURG MUNICIPALITY, February 20th.—Supply of transformers. (Reference B.X. 6 043.)

JOHANNESBURG MUNICIPALITY, February 20th.—Supply of switchgear (contract 322). (Reference B.X. 6 044.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of telephone switches. (Reference B.X. 6 018.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Reference B.X. 5 941.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of switchboard plugs (schedule C. 548). (Reference B.X. 5 998.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of magneto and common battery telephones and automatic dials (schedule C. 544). (Reference B.X. 5 999.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 4th.—Supply of automatic exchange power boards (schedule C. 562). (Reference B.X. 6 072.)

NEW ZEALAND POSTS AND TELEGRAPHS, March 5th.—Supply of v.i.r. wire (specification No. P. and T. 151/2 096). (Reference B.X. 6 089.)

VICTORIAN ELECTRICITY COMMISSION, March 10th (extension of time).—Two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th. Supply of 66 kV switchgear and protective system for Lyttleton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 11th.—Supply of bells and buzzers (schedule C. 552). (Reference B.X. 6 043.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 20th.—Steel water tank, on steel tower, with piping and fittings; and electric water level indicator. (Reference A.X. 9 073.)

POSTMASTER-GENERAL'S DEPARTMENT, March 24th.—Supply of dial parts (schedule C. 555). (Reference B.X. 6 047.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 25th.—Supply of cordless telephone switchboards (schedule C. 566). (Reference B.X. 6 071.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays, for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, April 1st.—Supply of submarine cable (schedule C. 561). (Reference B.X. 6 070.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o International Construction Co., Ltd., 56, Kingsway, London, W.C.2.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, April 30th.—Supply and erection of h.t. overhead transmission lines in isolated basins of Upper Egypt. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1; £10 5s., not returnable.

Tenders Accepted.

BARNES URBAN DISTRICT COUNCIL.—Hewittic Electric Co., Ltd., supply of Hewittic rectifier equipment, £3 395.

DUBLIN CITY COMMISSIONERS.—Hadens Engineering Co., Ltd., electrical installation at city abattoir, £1 997.

LONDON COUNTY COUNCIL.—Dorman, Long and Co., Ltd., supply of track rails and fishplates to tramways department, £53 896.

NEW SOUTH WALES GOVERNMENT RAILWAYS.—Australian General Electric Co., 1 500 V switchgear for Argyle sub-station, £5 832; A. Reyrolle and Co., Ltd., ironclad switchgear for Ultimo, £14 576.

READING TRAMWAYS COMMITTEE.—Equipment and Engineering Co., Ltd., supply of a re-conditioned, one-standard, E.L.I., single-operator, electric welding plant, mounted on type B covered in truck, £99 15s.

GLASGOW CORPORATION.—Alex. Robertson, electrical installations at 354 houses on Ashfield estate, £1 403 13s. 3d., and 102 houses on Braidfauld Street estate, £410 15s. 3d. Contracts in connection with change of frequency: Lancashire Dynamo and Motor Co., Ltd., one motor, reconstructed, £425; Sir William Arrol and Co., Ltd., six crane motors, £589; J. Bennie, Ltd., three lift motors, £327 6s.; C. A. Parsons and Co., Ltd., one alternator, reconditioned, £9 800. (All recommended).

WORK IN PROSPECT.

ACCRINGTON.—Additional 100 houses. Particulars, the Borough Surveyor.—Houses (48). Particulars, Prickett and Son.

BEDWORTH.—School (500 places). Particulars, the Director of Education, Warwick.

BILLINGHAM.—Bank, for Lloyd's Bank, Ltd.

BLACKBURN.—Extensions, Mental Defective Institution, Brockhall, Langho, to cost £90 000. Particulars, the Clerk, Preston

BOLLINGTON.—Housing scheme (36). Particulars, the Surveyor.

BRISTOL.—School. Particulars, Mr. A. R. Gough, 24, Bridge Street.—Housing seheme (58). Particulars, the City Engineer.

BURNLEY.—Casual ward extensions to cost £3 943. Particulars, the Clerk.—Additional 102 houses. Particulars from the Borough Surveyor.

CLITHEROE.—Additional 22 houses. Particulars, the Borough Surveyor.

CRANBROOK.—Housing scheme (54). Particulars, the Surveyor.

DENTON.—School (200 places). Particulars, the Director of Education, Northampton.

DUSTON.—School (325 places). Particulars, the Director of Education, Northampton.

EAST MOLESEY.—Talking film studio to cost £350 000. Particulars, Col. W. M. Power, Windsor House, Victoria Street, London, S.W.

ECCLES.—Fire station and quarters. Particulars, the Borough Surveyor.—Business stores, Regent Street, for the Co-operative Society.—Bank, for the Manchester and Salford Trustee Savings Bank.

FARINGDON.—Housing scheme (58). Particulars, Mr. A. B. West, Abingdon.

FINEDON.—Schools to cost £9 250. Particulars, Childs and Co., Finedon.

FOLKESTONE.—Catholic schools to cost £10 000. Particulars. Mr. Walters, Kearnsey, Dover.

GILLINGHAM (KENT).—School clinic and infant welfare centre. Particulars, the Borough Surveyor.

GRAPPENHALL.—Housing scheme (50). Particulars, the Surveyor.

HIGH WYCOMBE.—Housing scheme (150). Particulars, the Surveyor.

KINGSWINFORD.—Housing scheme (42). Particulars, the Surveyor.

BENN BROTHERS' DINNER.

Symbolical Costumes which will be a Feature of the Gathering.

AN important feature of the reception preceding Messrs. Benn Brothers' jubilee dinner at the Wharncliffe Rooms, Marylebone, to-morrow (Saturday) evening will be the attendance of fourteen members of the staff attired in attractive costumes symbolical of the publishing activities of the Benn organisation. The thirteen journals published by the firm of Benn Brothers Limited will be represented as follows:—"The Cabinet Maker," represented by a carpenter; "The Hardware Trade Journal," a blacksmith; "The Gas World," an overalled gasfitter; THE ELECTRICIAN, symbolical fancy costume; "The Timber Trades Journal," a lumberman; "The Fruit Grower," a planter; "Gardening Illustrated," a gardener; "The British Trade Journal," John Bull; "The Chemical Age," an alchemist; "The Nursery World," Peter Pan; "The Leather Trades Review," a leather worker; "The Miller," a miller; "Discovery," a Polar explorer. The fourteenth member of this colourful party will represent the book publishing activities of the sister company—Ernest Benn, Limited—and will be attired as Chaucer.

FENO ELECTRIC HEATERS.

Messrs. J. Schleper and Sons, 217 Heerengracht, Amsterdam, manufacturers of the Feno electric heaters, announce that they are willing to indemnify factors and dealers against actions for infringement of patents which may be brought against them by Mr. Alan Wright, on behalf of Inventum Electrical Appliances, Ltd., or by Inventum Appliances, Ltd., itself in respect of the sale of Feno heaters.

TRADE PUBLICATIONS.

THE latest publication of RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C.1, is a well-produced brochure dealing with the "Madrigal" receiver.

A cardboard lamp stand issued by Philips Lamps, Ltd. It is very handy for displaying Argenta lamps on the counter or in the window.

Flameproof controllers are dealt with in a new pamphlet, No. 258/1, issued by MAVOR AND COULSON, LTD., 47, Broad Street, Mile End, Glasgow.

A highly decorative and artistic calendar has been sent to us by CALLENDERS CABLE AND CONSTRUCTION CO., LTD., Hamilton House, Victoria Embankment, London, E.C.4.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38, Upper Thames Street, London, E.C.4, have issued a "Selsco Wiring System" catalogue. The reference number is 428, and this issue supersedes No. 185.

We have already drawn attention to the "Cosmos" lamp calendar for 1930, published by METRO-VICK SUPPLIES, Trafford Park, Manchester, and the same company has now issued a lamp folder illustrated on similar lines.

The latest publications of A. P. LUNDBERG AND SONS, LTD. 477, Liverpool Road, Holloway, London, N.7, include list El. 85, describing d.c. motor starting switches; El. 86, relative to removable-key switches, single and two-way tumbler types; and El. 87, concerning "Twin ob" switches.

"Do You Really Want Dry Steam?" is the title given to a new publication by WARREN BROTHERS (MIDDLESBRO') LTD., Prudential Buildings, Middlesbrough, the subject dealt with being Howards patent steam separator. The same firm has issued a list of ships in which these steam separators are used, including the "Mauretania," "Carmania" and "Viceroy of India."

In connection with the large and varied range of radio accumulators manufactured by the FULLER ACCUMULATOR CO., (1926) LTD., Woodland Works, Chadwell Heath, the company has issued a booklet (List 262A) on the general care and maintenance of these types of accumulators. In connection with unspillable accumulators, special and separate notes have been issued, and these are now available to the trade for distribution.

A well-bound, comprehensive and excellently produced catalogue has been sent to us by the BRITISH PORCELAIN CO., LTD., 343, Abbey House, 4, Victoria Street, London, S.W.1. The catalogue, consisting of nearly 300 pages, gives details and illustrations of a complete range of porcelain insulators for outdoor and indoor use, wall entry, roof bushing, etc. Particulars of other items, such as special cast terminals of copper, strain clamps, etc., are also given. The catalogue is numbered 407 and is now available to the trade.

New publications by FERRANTI, LTD., Hollinwood, are the following lists:—Wb. 402, type AF4 transformers; Wc 405, output transformers, condensers and chokes; We 406, radio measuring instruments; Wd 408, electro-dynamic loud-speakers; Wd 409, permanent trickle chargers; Wa 409/1, motor car battery chargers; Wd 410, type AF5 transformers; Wd 411/2, fixed condensers; Wc 412, push pull transformers; Wb 415, the "Ferranti" anode feed system; Wa 415/1a, anode feed resistances; Wb 417, h.t. supply units; Wb 418/1, valve testers; Wa 420, radio switches; Wd 401, type AF 3 transformers.

N.-E. ENGLAND SCHEME.

N.-E. England Electricity Scheme as Adopted by Central Electricity Board.

THE North-East England Electricity Scheme, which was submitted by the Electricity Commissioners in June last, has now been approved by the Central Electricity Board.

In the scheme as approved the area defined by the Commissioners is unaltered.

There is a provision that instead of constructing the principal main transmission lines along any of the routes specified in part I (1) of the third appendix, the Board may acquire any main transmission lines belonging to authorised undertakers and suitable for the purposes for which the first-mentioned lines are intended.

The secondary main transmission lines required for the purpose of interconnecting the systems of authorised undertakers entitled to receive a supply of electricity directly or indirectly from the Board with the system of the Board, are specified in part II of the third appendix; the secondary main transmission lines to be constructed by the Board except that any of those lines may by arrangement between the Board and any of the said authorised undertakers be constructed by such undertakers.

The owners of each of the generating stations specified in the fifth appendix shall be under the obligation as and when required by the Board to make arrangements with the Board: (*a*) with respect to the working of the station so as to generate such quantity of electricity at such rates of output and at such times as the Board may direct; and (*b*) with respect to the supply to the Board of all electricity so generated. So long as any generating station is being operated in accordance with the directions given by the Board the Board shall be under the obligation to supply either directly or indirectly to the owners thereof such amount of electricity as the owners may require for the purposes of their undertaking. The Board shall pay to the owners of the generating station for the electricity supplied to the Board such price as may from time to time be agreed between such owners and the Board or failing agreement as may be determined by arbitration.

The Board may if they think fit enter into temporary arrangements with the owners of any other generating station within the area to which the scheme relates with respect to the giving to the Board a supply of electricity of such amounts as may be agreed between the Board and the owners giving the supply.

Schedules of Stations and Lines.

The list of selected generating stations is as proposed in the Commissioners' Scheme.

In part I (1) of the third appendix, referring to extra high pressure overhead lines and/or underground mains, the following routes are substituted for those suggested in the Commissioners' scheme:—(1) North Tees to York, (2) North Tees to Dunston, (3) Dunston to Sunderland via or with connection to Carville A and B and South Shields, (4) Dunston to Sunderland, (5) North Tees to Darlington.

In part I (2) of the third appendix, relating to transforming stations in connection with the principal main transmission lines, it is provided that such transforming stations are to be provided at such points as to the Board may seem convenient for the purposes of supply to or from the undermentioned places: Carville, Darlington, Dunston, North Tees, South Shields, Sunderland. South Shields is added to the Commissioners' list and Scarborough is deleted.

In part II (1) of the third appendix, relating to secondary main transmission lines, the list of routes proposed by the Commissioners is superseded by the following list: (1) Scarborough to Bridlington as far as the boundary of the area of the scheme, (2) Scarborough to York via or with connection to Malton, (3) Malton to Whitby, (4) Darlington to Northallerton, (5) Dunston to Manors via or with connection to Close.

For the list of transforming stations in connection with secondary main transmission lines proposed in the Commissioners' scheme, the following list is substituted: Close, Darlington, Malton, Manors, Northallerton, Scarborough, Whitby.

The list of undertakers the frequency of whose supplies is to be changed from 40 to 50 cycles per second remains as in the original scheme, and a provision is added that no further 40 cycle generating plant beyond that already sanctioned by the Electricity Commissioners shall be installed in the area of the scheme by the owners of such undertakings.

The list of stations (specified in the fifth appendix) with regard to which temporary arrangements are to be made is unaltered.

ELECTRICITY SUPPLY.

GLASGOW Electricity Committee has authorised mains extensions at a cost of £12 000.

Basingstoke T.C. is to invite tenders for additional generating plant, to cost about £12 785.

Barnsley Electricity Committtee has received sanction to borrow £6 330 for mains extensions.

Swansea Electricity Committee seeks sanction to borrow £25 000 for lighting mains and services.

Dumfries T.C. has decided to extend the mains at a cost of £2 550, of which £1 500 is for a Maxwelltown scheme.

Dartford Electricity Committee is asking for a grant for the second instalment of the 11ing main scheme at a cost of £6 500.

Buckie (Banffshire) T.C. is to apply to the Electricity Commissioners for a Special Order to supply and distribute electricity.

The City of London Electric Lighting Co., Ltd., is considering a scheme for the extension of its power station in Southwark.

Sanction has been received by East Ham T.C. to a loan of £4 500 for additional accommodation for offices, stores, etc., at the electricity works.

Armitage P.C. has decided to adopt electricity for public lighting and to obtain energy from the Trent Valley and High Peak Electricity Co.

The Minister of Transport has decided not to grant the application by the Grampian Electricity Co. for leave to erect overhead lines and poles in the burgh of Doune.

The terms of the Windsor Electrical Installation Co. for the supply of electricity for public lighting at 3d. per kWh for five years have been accepted by Windsor T.C.

Fulham Electricity Committee seeks sanction to borrow £20 000 for domestic wiring and apparatus.—Various electricity mains are to be extended at a total cost of £1 030.

Ripon Corporation has applied for a loan of £3 000 for the extension of the electricity undertaking, with a view to supplying Bishop Monkton and other outlying districts.

Droxford R.D.C. has withdrawn its objection to the West Hants Electricity Co.'s application for a Special Order to supply electricity in the Council's area, with the exception of Hambledon.

Plymouth Electricity Committee has agreed upon the terms with the Cornwall Electric Power Co., for the supply of electrical energy at Torpoint and Saltash and the area up to St. Germans.

Aylesbury T.C. has applied for loans for £15 000 for mains and £9 000 for services for three years, and also for £2 000 to cover the cost of changing over certain sections of the borough from d.c. to a.c.

The lighting of Brentford Docks is to be improved by the G.W.R. by the provision of a modern electric installation. Flood lighting is to be provided at points where this system can be conveniently adopted.

Wigton R.D.C. has now consented to discuss with the Old Silkstone Co. the question of the inclusion of the area in the company's application for an Order to authorise its West Cumberland electricity scheme.

Tipperary U.D.C. has refused to accept the terms of the Electricity Supply Board for the lighting of the town, unless the Board is prepared to extend its poles, free of extra charge, to the approaches to the town in the urban area.

Aberystwyth T.C. has appointed a committee to ascertain terms for the purchase of the local electricity undertaking of the Chiswick Electric Supply Corporation. The Council has the option to purchase the undertaking in three or four years' time.

Bedford Electricity Committee has arranged terms for the supply of street lighting at Clophill. The corporation will convert existing gas standards at £1 10s. each and charge 5d. per kWh for electricity. The Committee has obtained sanction to borrow £4 000 for mains and £5 000 for plant.

Mr. J. Scott, consulting engineer to the West Lancashire R.D.C., is preparing specifications for an electricity scheme for Hesketh and Tarleton. The Electricity Commissioners have sanctioned the proposals in respect of these two areas and also in respect of Rufford, Banks, Halsall and Scarisbrick.

Battersea (London) Electricity Committee has voted £686 for services to 73 premises; £320 for mains extensions for private services; £2 110 for replacement with armoured cable of old v.b. distributors; and £250 for foundations for the Central Electricity Board's transformers at the generating station.

COMPANY NEWS.

Electrical Stock and Share Market Again Quiet—Improvement in Supply Companies' Share Prices—Directors' Reports and Dividend Announcements.

THE market for electrical stocks and shares has again been quiet, and a comparison of share prices with those ruling a week ago exhibits few features.

Radio Corporation of America shares have recovered one and a half points to 38, which is 5 points below the quotation a fortnight ago. Hydro-Electric Securities are slightly better at 44, after being higher, and the same remark applies to International Holdings at 5¾. Cables and Wireless "A" have touched bottom at 73½, but the "B" stock is a little firmer at 36½. Anglo-American Telegraph ordinary have dropped a point to 60½, quoted ex. dividend.

Electrical Equipment shares have shown weakness in spots, Enfield Cable Works ordinary falling half-a-crown to £4 15s., and British Insulated Cables 1s. 3d. to £3 17s. 6d. Ever-Ready descriptions have sagged a bit further, the ordinaries 1s. to 17s. 6d. and the participating preference 3d. to 28s. 9d. General Electric ordinary shares are unchanged at £2 6s. 3d., but the "B" preference at 25s. 6d. have lost the sixpence gained last week, as also have Associated Electrical Industries ordinary. Telegraph Construction £12 shares have improved from 24½ to 26.

Electricity supply companies' shares present a healthy appearance, and advances of 6d. are registered by the ordinary shares of the St. James and Pall Mall, from 25s. to 25s. 6d.; South London, from 25s. 6d. to 26s.; and Westminster, from 25s. to 25½. Whitehall Investments preference are also 6d. better at 24s. Victoria Falls Power ordinary receded 1s. 3d. on ex. dividend quotations.

In the transportation group there has been buying of British Electric Traction six per cent. preference stock, which, as a consequence, has been marked up 4 points to 129½. Calcutta Tramways preference shares have given way 1s. 3d. to 12s. 6d. Underground Electric Railways of London shares have shed 6d. of their last week's rise of 1s. 6d. Metropolitan Railway ordinary stock is 1½ points down. Winnipeg Electric Company's refunding stock is a point up at 84½ compared with last week.

Directors' Reports, &c

CROMPTON PARKINSON, LTD.—Intm. div. of 11¼% (same as last year), will be payable on March 31.

CUBAN TRANSATLANTIC RADIO CORPORATION.—A substantial interest in this concern has been acquired by the Radio Corporation of America.

LIMA LIGHT, POWER AND TRAMWAYS CO.—It is announced that 160 6% 1st mtge. debs. have bn. purchased and cancelled during the six months ended Jan. 1, 1930.

HALL TELEPHONE ACCESSORIES (1928), LTD.—Net pft. for year to Dec. 31, 1929, £30 094. Fin. div. on ord. shs. 6%, makg. 10% for year. Intm. div. of 4% has been paid. To gen. res. £5 000.

ASCOT DISTRICT GAS AND ELECTRICITY CO.—A special mtg. will be held at the company's offices on Feb. 10 to consider a Bill now being promoted in Parliament to authorise conversn. of the existing cap., the raising of addtnl. cap., etc.

SIEMENS UND HALSKE AKT.-GES.—A "Financial Times" correspondent reports that it is rumoured in Berlin that negotiations between Siemens und Halske Akt.-Ges. and Dillon Read and Co. of New York for a loan have been concluded. It is said that the loan will amount to $25 000 000, and will be in nom. $400 shs., issued at 233, and repayable at the end of 100 years at par.

ALLGEMEINE ELEKTRICITATS GESELLSCHAFT, BERLIN.—Net pft. for past year £958 500; increase £133 500. Div. 9%; increase 1%. Fwd. £170 000, with view to proposed abolitn. of remaing. pref. shs. Turnover of company and subsidiaries increased from £25 000 000 to £29 000 000, but general falling-off in home business during current year has resulted in decline in orders in hand from £19 250 000 to £17 500 000.

ALUMINIUM CORPORATION, LTD.—A scheme of reconstructn. has been drawn up which will involve the cancellatn. of the three outstandg. deb. issues, and the writing down and merging of preference and ordinary shs., etc. The effect on the balance-sheet will [illegible] 3,963, representg. works, plant, and properties, will be reduced to £300 000, and the £231 281 lost on the Eigiau Dam disaster will be eliminated. Cash and debtors will stand at £197 920.

MEXICAN TELEPHONE CO. ERICSSON.—This company, a subsidiary of the Swedish L. M. Ericsson Telephone Co., has decided to double its sh. cap. from 10 000 000 kronor (£600 000) to 21 600 000 kronor (£1 200 000) by issuing 60 000 new "B" shs. of nom. 180 kronor (£10) at 200 kronor a share. New issue has been reserved for hldrs. of old "A" shs. or "B" shs., who are entitled to subscribe to one new "B" sh. for every old one. The new cap. is to be used for extensn. of company's telephone system in Mexico, where the company's concessions comprise the entire country.

MELBOURNE ELECTRIC SUPPLY CO., LTD.—Pft. for year ended Aug. 31, 1929, £341 510, agst. £313 809, after deductg. £209 000, agst. £300 000, payable under first schedule to Act No. 3377. After providg. for int., sinkg. and service funds, blce. is £124 308, agst. £124 308. Addg. transfer from res., £21 286, agst. £21 283, makes £145 595. Res. for income-tax receives £25 300, agst. £24 400, pref. div. absorbs £40 000 and ord. div. is 10%, free of British tax, leavg. £235 to be paid over to State Electricity Commission of Victoria. Government has given notice to co. that it intends to purchase undertakgs. on Sept. 1, 1930.

ALDERSHOT GAS, WATER AND DISTRICT LIGHTING CO.—Rev. for 1929, £251 023, agst. £231 789. Expenditure £190 595, agst. £181 708. Surplus for year £60 428, agst. £50 080. From this have to be deducted divs. on consol. pref. stk., int. paid to bank and on redeemable mtgge. bonds and deb. stk., while statutory divs. have been paid for first half of year at rate of £5 19s. 6d., agst. £5 13s. 6d.% p.a. on "A" stk.; £4 9s. 6d., agst. £4 3s. 6d.% p.a. on "B" stk.; £5 (same) % p.a. on "C" stk. Directors recommend full statutory div. of £6 4s., agst. £5 15s.% p.a. on "A" stk., £4 14s., agst. £4 5s.%p.a. on "B" stk., and £5 (same)% p.a. on "C" stk. Fwd., £6 451, agst. £7 322.

PROVINCIAL ELECTRIC SUPPLY ASSOCIATION.

Matters Affecting the Industry—The Rating of Electricity Supply Companies' Undertakings—Assisted Wiring and Load Improvement.

THE eleventh general meeting of the Provincial Electric Supply Association was held on Tuesday at the Holborn Restaurant, London.

Mr. K. A. Scott Moncrieff presided in the unavoidable absence of the chairman of the association, Sir Harry Renwick, Bt., K.B.E.

The meeting was preceded by luncheon, and Mr. Scott Moncrieff read the speech prepared by Sir Harry Renwick, which dealt with questions arising from Parliamentary matters affecting the electrical industry and the activities of the association upon the various schemes adopted by the Central Electricity Board under the Electricity (Supply) Act, 1926. He dealt particularly with the question of standardisation of frequency under those schemes, and he expressed the hope that the Central Board would afford greater assistance to the smaller undertakings in this respect.

Sir Harry next dealt fully with the operation of the Rating and Valuation Act, 1925, and the heavy increases in assessments (in some cases as high as 700 per cent.) experienced by all electricity supply companies, and gave instances of the cost of extra rating amounting to between ¼d. and ½d. per unit on every unit sold. He emphasised the fact that while the companies are being burdened each year with higher costs, they are being forced to make reductions in rates for supply. He said that the association was following closely the provisions of the Coal Mines Bill now before Parliament, the effect of which must increase the coal costs of public utility undertakings.

After dealing with the litigation which the association had undertaken on behalf of the member companies, he referred to the case of the Attorney-General v. the London and Home Counties Joint Electricity Authority, under which judgment the Bill which the joint authority had promoted in Parliament for the transfer of purchase rights, at present in the hands of local authorities, to the joint authority had to be withdrawn as the High Court found that each set of clauses was outside the powers of the joint authority. He deplored the want of harmonious working and co-operation between the joint electricity authority and the local authorities and the companies.

After treating with a large number of other important matters concerning the electricity supply industry, Sir Harry dealt with the many services rendered by the association to its member companies and the advantages accruing from having a central executive body in London. The association had admitted to membership during the past year 10 other companies, and it could now be said to represent practically the whole of the electric lighting companies in the country outside London.

Sir Harry urged the necessity of treating the generation, distribution, and sale of electricity as a commercial matter; generation and distribution were no longer scientific marvels, but the science and art of salesmanship must be regarded as vital to the electricity supply industry as to the exploitation of the hundred-and-one commodities of every-day life. The actual livelihood of the 52 000 or more employees in the industry must rest upon the enterprise of the suppliers in disposing of their energy to consumers.

Sir Harry expressed the view that industry could not go too far in advertising their commodity and in educating the public to its value and its advantages. Propaganda and the necessity of giving service to consumers in the matter of hire purchase and assisted wiring facilities could result in the quadrupling of the consumption by consumers. He gave examples of small artisan houses where the usual yearly consumption approximated 100 to 150 units, and with assistance from companies in the electrification of the same type of house the consumption had reached over 1 000 units per annum.

Sir Henry paid a tribute to the controlling bodies of the industry—namely, the Ministry of Transport, the Electricity Commissioners, and the Central Electricity Board, and stated that it was not only the aim but the duty of the association to give to those authorities support and co-operation in their very difficult duties.

The balance sheets and accounts for the years ended December 31st, 1927, and December 31st, 1928, were unanimously approved, and the proceedings terminated with votes of thanks to Sir Harry Renwick for his hospitality and for his work as chairman of the association, and to Mr. Scott Moncrieff for presiding at the meeting.

SIDWELL AND CO., 36, Bristol Road, Birmingham, electrical engineers. £12 14s. 5d. October 23rd.

Deeds of Arrangement.

BEMAN, Eugene Cecil, trading as NEWMAN ELECTRICAL CO., 5 and 6, Eden Street, Hampstead Road, dealer in electrical goods. Dated January 17th; filed January 22nd. Trustees, W. A. J. Osborne, 119, Finsbury Pavement, E.C., and another. Liabilities unsecured, £5 305; assets, less secured claims, £4 710.

FORD, Herbert William, 57B, Victoria Street, and 50, The Esplanade, Burnham-on-Sea, wireless and electrical engineer. Dated January 17th; filed January 21st. Trustee, A. Collins, 28, Baldwin Street, Bristol. Liabilities unsecured, £303; assets, less secured claims, £148.

Receiverships.

ELECTRICAL AND CHEMICAL EBONITE CO., LTD. C. F. Palmer, of 86/88, Queen Victoria Street, E.C.4, was appointed receiver on December 30th, 1929, under powers contained in debenture dated May 27th, 1925.

M. P. A. WIRELESS, LTD. J. J. Ure, C.A., of 11A, Hart Street, W.C., was appointed Receiver and Manager on January 8th, 1930, under powers contained in first mortgage debentures dated May 8th, to November 28th, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

NEWPORT ELECTRICAL CO., LTD. (Mon.). Registered January 18th, £400 debenture to L. J. Brown, Brynderyn, Victoria Avenue, Newport; general charge. *Nil. May 17th, 1928.

N. S. ACCUMULATORS, LTD., London, S.E.—Registered December 30th, series of £1 500 debentures; present issue £500; general charge. *Nil. May 28th, 1928.

RHEOSTATIC CO., LTD., Slough, electrical engineers.—Registered January 6th, mortgage to bank; charged on land at Salt Hill.

WEALD ELECTRICITY SUPPLY CO., LTD., London, E.C.—Registered January 2nd, charge to bank; charged on Fairview, Hawkhurst. *£100 000. October 22nd, 1929.

Satisfactions.

ASHTON ELECTRICAL CO. (PRESTON), LTD. Satisfaction registered January 11th, £200, registered October 6th, 1927.

BUILTH WELLS ELECTRIC SUPPLY CO., LTD. Satisfaction registered January 11th, £2,500, registered April 10th and October 15th, 1926.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

BANKS, B. D., AND CO., electrical engineers, 476, Cowbridge Road, Cardiff. A meeting of creditors has decided that, unless the debtor is able to find sufficient guarantees for a composition of 10s. in the £, his petition in bankruptcy shall be filed. The statement of affairs reported liabilities of £1 020, all due to unsecured creditors, and assets estimated to realise £364, less preferential claims of £109, or a deficiency of £765. The debtor stated that he estimated his turnover at about £40 weekly, while his drawings had been at the rate of £5 a week, and the other overhead expenses totalled approximately £15. There was a life policy on the debtor's life, the surrender value of which was approximately £25, and this was held by the bank.

WILD, Mrs. E. H., trading as the C. B. PORTABLE RADIO CO., wireless apparatus dealer, 117A, Abergele Road, Colwyn Bay. The deed of arrangement executed by this debtor has been confirmed by a meeting of creditors. A statement of affairs was submitted, which showed liabilities of £675, all due to the trade, and a deficiency of £534. The debtor commenced trading at Colwyn Bay in June of last year, and subsequently removed to her present address. The creditors include:—Hirst, Ibbotson and Taylor, £141; Murdock Trading Co., £27; Harwol Specialities, £50; Ward and Co., £23; Hollingdrake and Son, Ltd., H., £112; Northern Steel and Hardware Co., £72; Selectors, Ltd., £25; B. V. C. Engineering Co., £18.

London Gazette, etc.

Bankruptcy Information.

GOLDSMAN, Jacob Louis, 100, High Holborn, London, W.C.2, radio engineer. Receiving order January 22nd. Debtor's petition. First meeting, February 3rd, 11.30 a.m., and public examination, March 13th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

JACKSON, John Harold, The Dock House, Winsford, Chester, electrical engineer. Receiving order, January 21st. Debtor's petition.

Notice of Dividend.

BLAIR, Edward Winnington, electrical engineer and contractor, lately at 6, Queen's Parade, Brent Street, Hendon, Middlesex, trading as BLAIR AND SON. First and final dividend, 6s. 11d. per £, payable January 30th, Official Receivers, 29, Russell Square, London, W.C.1.

The above notice is in substitution for notice of dividend of 7s. 2d. per £ published in the "London Gazette" of January 14th, the dividend then advertised not having been paid.

Bankruptcy Proceedings.

HOEY, Frank Walter Charles, of 51, Montgomery Road, Chiswick, wireless and electrical dealer, lately 29, Sicilian Avenue, London, W.C. Under the Receiving Order made on January 7th on the debtor's petition, the first meeting of creditors was held at the London Bankruptcy Court last week. The statement of affairs submitted showed liabilities £4 635 and assets £2 409. From statements made by the debtor in preliminary examination, it appeared that in April, 1926, he purchased for £1 150 the business of wireless and electrical accessories' dealer carried on under the style of Scientific Appliances at the above address. The business had not been a success from the start, and owing to ill-health he had not been able to concentrate on it. His rent was £200 per annum, and the wages of his two assistants averaged £8 10s. a week. Up to early in 1929 he paid his way. In that year a person who carried on business at Stamford Hill called upon him and made considerable cash purchases In November, 1929, that person started buying on credit, and in the following month purchased goods on credit to the value of £2 000. At this time the debtor was being pressed by creditors, and he in turn pressed his customer for the payment of his account. He saw him on various occasions, but was put off by various excuses, and just before Christmas he called at the customer's business address but found the premises locked up. Inquiries were still being pursued, but up to the present nothing has been heard of the man. In consequence of this severe loss, he sold his business for £400, which he paid into the bank in reduction of his overdraft. He filed his petition because he was being pressed by creditors, and also because he thought that the Official Receiver would be able to bring more pressure to bear on this man than he himself was able to do. In the absence of any resolutions, the case was left with the Official Receiver. Creditors:—Aeonic Radio Co., Ltd., £133; Acoustophone, Ltd., £49; Acquaproof Co., Ltd., £68; Barton, A. D., and Co., £121; Burndebt Wireless Co., £138; Bedford Electrical and Radio Co., £49; Benjamin Electrical Co., Ltd., £155; Concerts Radio Electrical Co., £140; Cole, E. K. and Co., Ltd., £38; Cosser, G. C., Ltd., £33; Dew, A. J., and Co., Ltd., £50; Dubilier Condenser Co., £42; Celistem, Ltd., £26; Downing and Co., Ltd., £71; Edison and Swan Electric Co., Ltd., £125; Formo Co., Ltd., £97; General Electric Co., Ltd., £145; Garnett Whitley and Co., Ltd., £132; Graham Fairrish, Ltd., £55; Haw and Co., £742; Midland Wireless Services, Ltd., £187; Mullard Bros., Ltd., £45; M.P.A. Wireless, Ltd., £26; McMichael, Ltd., £49; Premier Electric Heaters, Ltd., £38; Phillips Lamps, Ltd., £119; Sun Electrical Co., Ltd., £42; Siemens Bros., Ltd., £93; Saxon Radio Co., Ltd., £24; Sterns Manufacturing Co., Ltd., £126.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

INVINCIBLE.—507 780. Class 8. Instruments and apparatus for use in wireless telephony, but not including electric batteries. Gas Light Fittings Co., Ltd., 322, Walworth Road, London, S.E.17; merchants. November 13th, 1929. To be associated with No. 494 477 (2 662) and another.

SUNSTAR.—507 781. Class 8. Instruments and apparatus for use in wireless telephony, but not including electric batteries. Gas Light Fittings Co., Ltd., 322, Walworth Road, London, S.E.17; merchants. November 13th, 1929. To be associated with No. 494 479 (2 662).

PHILILITE.—505 341. Class 13. Electric lamps and electric lighting fittings, all being metal goods not included in other classes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, Emmasingel 13d, Eindhoven, Holland; manufacturers. August 16th, 1929. (Date claimed under International Convention, April 23rd, 1929.) To be associated with No. 505 343 (2 698) and others.

LEWBESTITE.—507 689. Class 50. Electrical fittings manufactured from animal and vegetable substances not included in other classes, and wire covered with asbestos and wire covered with a composition in which bitumen predominates. The London Electric Wire Co., and Smiths, Ltd., 7, Playhouse Yard, Golden Lane, London, E.C.1; manufacturers. November 11th, 1929. To be associated with No. 442 591 (2 391) and others.

SEMPELIS.—508 505. Class 8. Wireless telephonic apparatus and parts thereof, and radio receiving sets in combination with gramophones. Fanny Alford, The Nook, Rockbeare, near Exeter; merchant. December 6th, 1929.

HYPERMITE.—507 136. Class 8. Wireless telephonic and telegraphic instruments and apparatus. Radio Instruments, Ltd. 12, Hyde Street, London, W.C.1; manufacturers. October 22nd, 1929.

EXTENSCALE.—507 254. Class 8. Electrical resistances and electrical transformers; and ammeters, voltmeters, wattmeters, galvanometers and similar electrical testing apparatus. Elliott Brothers (London), Ltd., 1, Central Buildings, Westminster, London, S.W.1; electrical engineers. October 28th, 1929.

KODITE.—508 769. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Kodak, Ltd., Kodak House, Kingsway, London, W.C.2; manufacturers and dealers. December 13th, 1929. To be associated with No. 75 818 (548) and others.

KODAWIND.—508 770. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Kodak, Ltd., Kodak House, Kingsway, London, W.C.2; manufacturers and dealers. December 13th, 1929. To be associated with No. 75 818 (548) and others.

SECOS.—509 047. Class 8. Philosophical instruments, scientific instruments and apparatus for teaching. Lissen, Ltd., Lissenium Works, Friars Lane, Richmond, Surrey; manufacturers. December 24th, 1929.

LIVER.—508 128. Class 5. Wire; and unwrought or partly wrought metal for use in the manufacture of electrical goods. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. November 23rd, 1929. To be associated with No. 472 161 (2 536) and others.

METAL AND CHEMICAL PRICES.

TUESDAY, January 28th.

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£76 10 0		10s. 0d
Electro Wirebars	,,	£83 15 0	—	—
H.C. Wires, basis	per lb.	11⅝d.	⅛d.	—
Sheet	,,	11⅜d.	—	—
Phosphor Bronze—				
Wire (Telephone), basis	per lb.	1s.2⅛d.	⅛d.	—
Brass (60/40)—				
Rod, basis	per lb.	9d.	—	—
Sheet ,,	,,	10⅛d.	—	—
Wire ,,	,,	10⅛d.	—	—
Pig Iron—				
Cleveland Warrants	per ton	£3 15 0	—	—
Galvanised Steel Wire, basis 8 S.W.G.	,,	£14 15 0	—	—
Lead Pig—				
English	per ton	£23 0 0	—	—
Foreign or Colonial	,,	£21 12 6	2s. 6d.	—
Tin—				—
Ingot	per ton	£174 15 0	15s. 0d.	
Wire, basis	per lb.	2s. 4½d.	½d.	—
Aluminium Ingots	per ton	£95 0 0	—	—
Spelter	,,	£19 17 6	7s. 6d.	—
Mercury	per bottle	£23 5 0	—	—

Sulphur—Flowers, Ton £12 0 0 ,, Roll, ,, £10 10 0 *Copper Sulphate* .. Ton £25 to £25 10 0 *Boric Acid* (Crystals) ,, £30 0 0

Sulphuric Acid (168° Tw.) Ton £6 15 0 *Sodium Chlorate*—Per lb., 2½d *Sodium Bichromate*—Per lb., 3½d.

Rubber—Para fine, 8½d.; plantation, 1st latex, 7 ⅛ d.

*** The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

According to James Forster and Co., there is nothing to report, prices being still under control. Conditions are quiet in the United States with the price unchanged at 6.25 cents per lb.

Closing prices on January 24th were £21 11s. 3d. for all positions, practically unchanged on the week.

The students of the Brush Electrical Engineering Co., Ltd., held their annual supper dance at the King's Head Hotel, Loughborough, last Friday. A large company, amongst whom was Mr. Emile Garcke, chairman of the company, spent a very enjoyable evening.

There was a large attendance at the eighth annual dinner of the staff of Francis Polden and Co., Ltd., electrical contractors, London, when Mr. Francis Polden thanked the staff for the excellent work and support which they had given during the past year. The dinner was succeeded by a concert and dancing, and the evening owed much of its success to the hard work of Mr. E. D. Gill, secretary of the company.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

320 705 H. F. JOEL, JUN. Means for controlling apparatus at a distance. (4/8/28.)
320 706 RELAY AUTOMATIC TELEPHONE CO., LTD., and B. B. JOHNSON. Telephone exchange systems. (4/8/28.)
320 711 W. W. TRIGGS (WILLIAMS OIL-O-MATIC HEATING CORPORATION). Electric circuit controls for electrically operated liquid-fuel burning-apparatus. (10/8/28.)
320 713 M. TROUTON. Electrical vibratory devices such as loud speakers. (10/8/28.)
298 897 INTERNATIONAL GENERAL ELECTRIC CO., INC. Electric switch operating devices. (15/10/27.)
298 575 ELECTROLUX, LTD. Absorption refrigerating apparatus containing an inert gas. (11/10/27.)
299 047 DR. A. SCHERBIUS and E. R. RITTER (trading as SCHERBIUS AND RITTER). Electric switches. (21/10/27.)
320 783 S. G. S. DICKER (N.V. PHILIPS' GLOEILAMPENFABRIEKEN). Electric discharge tubes. (1/11/28.)
320 784 BRITISH BRASS FITTINGS, LTD., and A. LOGAN. Electric heating units for cooking and like purposes. (2/11/28.)
299 856 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Keying systems for use in radio or line telegraphy. (2/11/27.)
300 139 TECALEMIT, LTD. Means for automatically breaking the circuit of the accumulators on automobile vehicles. (5/11/27.)
320 793 J. A. CRABTREE. Electrical plug-and-socket couplings. (7/11/28.)
302 180 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Circuit arrangements suitable for use in signalling systems. (10/12/27.)
311 314 AKT.-GES. BROWN, BOVERI ET CIE. Electric insulators with screens of porcelain or the like non-conducting material. (9/5/28.)
310 021 AKT.-GES. BROWN, BOVERI ET CIE. Electric insulators. (20/4/28.)
303 011 BRITISH THOMSON-HOUSTON CO., LTD. Synchronous inductor frequency changers. (24/12/27.)
303 027 E. CITOVICH. Electrochemical processes. (24/12/27.)
307 009 LANDIS AND GYR SOC. ANON. Electric switch, more particularly for automatically operated switchgear. (1/3/28.)
303 367 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Circuit arrangements suitable for use in thermionic valve transmitters. (31/12/27.)
320 818 L. ST. C. BROUGHALL. Electrolytic preparation or purification of metals. (31/12/28.)
320 822 R. P. A. ANDERSSON. Multiple-filament electric incandescent lamps. (3/1/29.)
304 232 MASCHINENFABRIK OERLIKON. Step switch for regulating the voltage of transformers under load. (17/1/28.)
320 825 F. G. MCDONALD. Electric ignition switch indicators for motor vehicles. (10/1/29.)
305 168 VERFINIGTE GLUHLAMPEN UND ELEKTRICITATS AKT.-GES. Method of and apparatus for recording by means of cathode rays, rapidly occurring phenomena. (1/2/28.)
304 700 BRITISH THOMSON-HOUSTON CO., LTD. High frequency electric signalling systems. (24/1/28.)
304 734 SIEMENS-SCHUCKERTWERKE AKT.-GES. Driving devices for "pilgrim step" motion rolling trains. (25/1/28.)
320 832 ANCIENS ETABLISSEMENTS BARBIER, BENARD AND TURENNE SOC. ANON. Feeding devices for the carbons of arc lamps. (9/11/28.)
305 987 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Radio and the like receiving systems. (13/2/28.)
306 151 E. KELSEN. Electrolytic manufacture of iron. (16/2/28.)
320 627 J. L. BAIRD and TELEVISION, LTD. Television apparatus and the like. (16/4/28.)
320 628 J. L. BAIRD and TELEVISION, LTD. Speed controlling means for television and like apparatus. (16/4/28.)
320 687 J. L. BAIRD and TELEVISION, LTD. Apparatus for the production and reception of electric signals including television apparatus and the like. (20/6/28.)
311 242 DR. P. MEYER AKT.-GES. Mercury electric switches. (7/5/28.)
320 611 J. Y. JOHNSON (I.G. FARBENINDUSTRIE AKT.-GES.). Manufacture and production of magnetic cores of high permeability. (14/7/28.)
320 916 L. A. LEVY and ALMEIDA ACCUMULATORS, LTD. Secondary electric cells. (27/4/28.)
291 056 AKT.-GES. BROWN, BOVERI ET CIE. Controlling arrangement for electric ship propulsion systems. (25/5/27.)
291 063 DR. C. SCHINZEL. Method of producing printing-plates by electrochemical processes. (25/5/27.)
320 819 E. Y. ROBINSON and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Vacuum electric tube devices. (19/6/28.)
292 538 E. KIEBACK and P. PETER (trading as KIEBACK AND PETER MESSGERATE UND REGLER, DIPL. ING. [Firm of]). Automatic electric circuit-controllers. (21/6/27.)
320 850 BRITISH THOMSON-HOUSTON CO., LTD., and F. P. WHITAKER. Mercury arc rectifiers. (20/6/28.)
292 626 SIEMENS AND HALSKE AKT.-GES. Thermionic valve modulation circuits. (21/6/27.)
320 870 MUIRHEAD AND CO., LTD., F. H. MUIRHEAD and J. V. FOLL. Automatic telegraphic reperforators. (23/6/28.)
292 957 BRITISH THOMSON-HOUSTON CO., LTD. Automatic reclosing circuit-breaker systems. (27/6/27.)
292 960 BRITISH THOMSON-HOUSTON CO., LTD. Automatic reclosing circuit-breaker systems. (27/6/27.)
290 658 SIEMENS AND HALSKE AKT.-GES. Magnetic alloys. (20/5/27.)
290 219 L. ROUZET. Variable condensers. (10/5/27.)
320 897 SWITCHGEAR AND COWANS, LTD., and D. FIRTH. Automatic regulation of power factor in a.c. systems. (21/4/28.)
320 857 A. D. CONSTABLE and A. E. FRANKLING. Electric switches. (18/7/28.)
320 889 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Systems of control for alternating-current electric motors. (21/7/28.)
320 922 J. STONE AND CO., LTD., and A. E. HONEY. Electric lighting installations for railway and like vehicles. (21/7/28.)
320 923 F. MERK. Switch arrangement for line inter-communication switches with multiple lines. (23/7/28.)

Applications for Patents.

October 11th.

30 920 H. C. HEIDE (MOTOR METER GAUGE AND EQUIPMENT CORPORATION). Electric gasoline gauge.
30 911 OESTERREICHISCHE DYNAMIT NOBEL AKT.-GES. Electric fuses. (14/11/28, Austria.)
30 912 E. PFIFFNER. Electric conductor. (15/10/28, Germany.)
30 914 SIEMENS-SCHUCKERTWERKE AKT.-GES. Trunk cable. (20/10/28, Germany.)
30 949 TELEFUNKEN GES. FÜR DRAHTLOSE TELEGRAPHIE. Telegraph systems. (26/11/28, Germany.)
30 934 TELEPHON-APPARAT-FABRIK E. ZWIETUSCH AND CO. GES. Containers for electrical condensers. (3/11/28, Germany.)
30 878 WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. Refrigerating apparatus. (30/10/28, U.S.)

31 308 P. Allenic. Electrical connection. (3/11/28, France.)
31 338 Associated Electrical Industries, Ltd., W. Needham and C. Sykes. Electric heating elements.
31 339 Associated Electrical Industries, Ltd., J. W. Buckley and C. Sykes. Electric hot plates, etc.
31 293 Automatic Telephone Manufacturing Co., Ltd., L. M. Simpson. Electric totalisators.
31 260 H. V. Clark and H. G. Davis. Reduction of echo effects in electric signalling systems.
31 278 F. E. Collinson. Tuning wireless apparatus, etc.
31 257 F. W. Dixon and Douglas Motors, Ltd. Battery ignition systems for engines.
31 285 C. C. Garrard and General Electric Co., Ltd. Electric switchgear.
31 215 Harris and Sheldon, Ltd., and R. G. Turner. Electric inspection lamps.
31 296 Kupfer und Messingwerke Akt. Ges. Hirsch. Electric induction furnace. (15/10/28, Germany).
31 279 International General Electric Co., Inc. Accumulators. (15/10/28, Germany.)
31 250 Magnet-Werke Ges. fur Eisenach Spezialfabrik Elektromagnetic Apparate. Electromagnetic chuck. (14/12/28, Germany.)
31 355 Maschinenfabrik Oerlikon. Igniting mercury vapour arcs. (29/10/28, Switzerland.)
31 334 J. M. Rokes and Telegraph Construction and Maintenance Co., Ltd. Electric welding machines.
31 324 Siemens und Halske Akt. Ges. Production of insulating bodies. (17/10/28, Germany.)
31 343 Siemens und Halske Akt. Ges. Distant transmission of measurement values. (31/1/028, Germany.
31 300 G. Tauschek. Setting valves, etc., electromagnetically. (22/10/28, Austria.)
31 336 Telefunken Ges. fur Drahtlose Telegraphie. Radio receivers, etc. (15/10/28, Germany.)
31 337 Telefunken Ges. fur Drahtlose Telegraphie. Electrical recording devices. (20/10/28, Germany.)
31 227 J. Ward. Magnetic controllers for loom shuttles.
31 284 Westinghouse Brake and Saxby Signal Co., Ltd. Multiple control apparatus. (20/10/28, U.S.)

October 16th.

31 431 G. A. L. Baldwin. Valves for wireless.
31 480 H. C. Atkins and Gramophone Co., Ltd. Wireless receivers.
31 509 J. Bolsom and A. E. Chapman. Wireless receiving and projecting apparatus.
31 481, 31 483 G. E. Condliffe and Gramophone Co., Ltd. Electron emitting cathodes.
31 496 A. K. Croad (Sand Spun Patents Corporation). Magnetic clutches. (22/7/28.)
31 400 W. H. Dearden, G. Lawton and Standard Telephones and Cables, Ltd. Manufacture of magnetic material.
31 481, 31 482 F. Ellington and Gramophone Co., Ltd. Electron emitting cathodes.
31 484 F. Ellington, Gramophone Co., Ltd., and W. F. Tedhan. Electron emitting cathodes.
31 438 General Electric Co., Ltd., and J. M. Waldram. Models for design of illuminating systems.
31 439 General Electric Co., Ltd., and D. A. Oliver. Amplifiers.
31 469 P. J. Hageman. Wireless receiving apparatus, etc.
31 452 I.G. Farbenindustrie Akt. Ges. Manufacture of material capable of being marked by electrolytic decomposition. (16/10/28, Germany.)
31 442 International General Electric Co., Inc. Amplifying arrangements (16/10/28, Germany.)
31 432 R. A. Kennedy. Wireless apparatus.
31 429 H. Leitner. Dynamos, etc.
31 394 W. J. Line. Switch fixing and earthing.
31 453 R. E. D. Maradei. Electric lamps.
31 371 W. Needham. Manhole covers, etc.
31 402 Standard Telephones and Cables, Ltd. Dust covers for relay panels, etc.
31 404 Standard Telephones and Cables, Ltd. (W. Hatton). Automatic telephone systems, etc.
31 401 Standard Telephones and Cables, Ltd. (L. J. J. Schreiber and E. H. Preud'Homme). Bells for telephone etc., systems.
31 403 Standard Telephones and Cables, Ltd. (Western Electric Co.). Wave signalling systems.
31 501 Telephon-Apparate-Fabrik E. Zweitusch and Co. Ges. Containers for electric condensers. (10/11/28, Germany.)
31 366 G. Wilkinson. Electric heat storage cookers.

October 17th.

31 530 T. S. Anderson and S. E. Lloyd. Variable condenser.
31 599 Arcturus Radio Tube Co. Photoelectric cells. (18/10/28, U.S.)
31 586 Associated Electrical Industries, Ltd., and J. B. Hansell. Oil-immersed electrical apparatus.
31 585 Automatic Telephone Manufacturing Co., Ltd., F. E. Comyn and R. Taylor. Telephone systems.
31 591 C. E. G. Bailey. Electrical measuring apparatus.
31 587 British Thomson-Houston Co., Ltd., and J. C. Reed. Mercury arc rectifiers.
31 588 British Thomson-Houston Co., Ltd. Control of inverse voltage.
31 522 J. H. Carrick and Greenwood and Batley, Ltd. Electrical generating machines.
31 525 H. S. Cooke. Electric switches.
31 557 R. D. Dunlop. Magnetos.
31 614 Electrical Research Products, Inc. Signalling systems. (19/11/28 U.S.)
31 521 G. C. and J. C. Forsyth. Couplings, etc., for electrical tubing.
31 619 H. J. Garnett and W. S. Smith. Submarine cables.
31 591 Gramophone Co., Ltd. Electrical measuring apparatus.
31 527 G. W. E. Hardy. Disinfector for telephone apparatus, etc.
31 567 D. Kingsbury, W. R. Rawlings and A. Reyrolle and Co., Ltd. Plug and socket connections, etc.
31 590 Lissen, Ltd., and R. P. Richardson. Thermionic valves.
31 549 Loewe-Audion Ges. and B. Wienecke. Connection of directly heated filaments of electron valves to electric mains. (17/10/28, Germany.)
31 539 C. O. Marshall. Coupling for electrical tubing, etc.
31 615 J. Robinson. Wireless receiving apparatus.
31 610 Siemens-Schuckertwerke Akt. Ges. Continuously acting absorption machines. (26/10/28, Germany.)

COMING EVENTS.

Friday, January 31st (To-day).

Institution of Electrical Engineers (North-Eastern Students' Section).—Armstrong College, Newcastle-upon-Tyne. Joint meeting with the Graduates of the North-East Coast Institution of Engineers and Shipbuilders. Paper by Mr. W. G. Thomson on "The Electrical Propulsion of Ships." 7.15 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster, London, S.W. Informal meeting. Paper by Mr. F. Onions on "Superheating." 7.30 *p.m.*

Saturday, February 1st.

Institution of Electrical Engineers (North-Western Students' Section).—Visit to the works of Messrs. W. T. Glover and Co., Trafford Park, Manchester 2.30 *p.m.*

Monday, February 3rd.

Institution of Electrical Engineers (Western Centre).—Abbey Hall, Catherine Street, Plymouth. Faraday lecture by Captain P. P. Eckersley on "Broadcasting by Electric Waves." 7 *p.m.*

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Discussion on "Maintenance of Telephone Plant," opened by Mr. H. G. S. Peck. 7 *p.m.*

Tuesday, February 4th.

Electrical Development Association (Leeds Branch).—Electricity Department, 1, Whitehall Road. Lecture by Mr. C. F. Wells on "Domestic Electrification with special reference to E.D.A. Electric Homes (Outlet) Campaign."

Electrical Association for Women.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Lantern lecture on "Plastic Lighting and Modern Architecture—Changing Styles in Cities and Homes," by Mr. G. S. Francis. 3 *p.m.*

Electrical Association for Women (Bristol and District Branch).—Electricity Offices, Colston Avenue. Lecture by Mr. L. Burdes on "Your Servant—Electricity." 3 *p.m.*

Electrical Contractors' Association (Derby Branch).—Ordinary meeting. 5 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—17, Albert Square, Manchester. Joint meeting at the invitation of the Institution of Post Office Electrical Engineers. Paper by Mr. S. S. A. Watkins on "Talking Films."

Institution of Electrical Engineers (Dundee Sub-Centre).—Lamb's Restaurant, Reform Street. Informal meeting. Discussion on "Curious faults and Experiences." 7.30 *p.m.*

Electrical Society of Glasgow.—30, Gordon Street. Lecture by Mr. T. Ingram Craig on "The Electric House." 7.30 *p.m.*

Television Society.—Engineers' Club, Coventry Street, Piccadilly Circus, London. Lecture by Mr. G. P. Barnard on "The Photoconductivity of Selenium and various other Substances." 8 *p.m.*

Wednesday, February 5th.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting. 2.30 *p.m.*

Institution of Electrical Engineers (Wireless Section).—Institution, Savoy Place, Victoria Embankment, London. Visit to the Laboratory of the City and Guilds Engineering College, South Kensington. Short papers on new developments. 6 *p.m.*

Institution of Electrical Engineers (Tees-Side Sub-Centre).—Cleveland Technical Institute, Middlesbrough.

Sheffield Illumination Society.—Lighting Department. Paper on "Office Notes," by Mr. E. Marrison. 8 *p.m.*

Thursday, February 6th.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting. 11 *a.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 3.15 *p.m.*

Institution of Electrical Engineers.—Hotel Cecil, Strand, London. Annual dinner. 7 for 7.30 *p.m.*

Friday, February 7th.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Dr. R. L. Smith-Rose on "Radio Direction Finding by Transmission and Reception." 5.15 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London. Papers by Mr. G. F. Shotter on "A New Null Method of Testing Instrument Transformers and its Applications," Messrs. R. S. J. Spilsbury and A. H. M. Arnold on "Some Accessory Apparatus for Precise Measurements of Alternating Current," and Mr. A. H. M. Arnold on "Precision Testing of Current Transformers." 7 *p.m.*

North-East Coast Institution of Engineers and Shipbuilders (Graduate Section).—Bolbec Hall, Newcastle-on-Tyne. Joint meeting with the Institution of Electrical Engineers Students' Section. Paper by Mr. W. G. Thompson on "The Electrical Propulsion of Ships." 7.15 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Paper by Mr. G. F. O'Riordan on "Co-operation between Technical Institutions and Industry." 7.30 *p.m.*

The Jubilee Dinner.

NEARLY thirty years ago the KING, after his return from his Empire tour as DUKE OF CORNWALL AND YORK in the "Ophir," made his famous "Wake-up England" speech at the Guildhall. Inspired by that rousing call to action the firm of Benn Brothers, Ltd., at once initiated Empire numbers of the two or three trade journals then published by the firm. Then, as now, the times were difficult—the South African War was still dragging on—and the future was uncertain. Yet, as Sir ERNEST BENN recalled in the telegram which he sent to the KING on the occasion of the memorable Jubilee Dinner of the firm on Saturday, since responding in that way to HIS MAJESTY'S call to action, progress has been continuous. The KING'S active interest in British industry and trade has been repeatedly manifested both before and during the stern period that began so soon after he came to the throne. It was obviously fitting to convey to him the loyal greetings of those who, working during the latter half of their completed fifty years of activity under the inspiration of his Guildhall speech, had become, through the expansion of their group of trade journals, more and more closely associated with the industries and commerce of the country—in short, with its lifeblood. The gratifying nature of the KING'S reply will be an added encouragement to all concerned to go forward to still greater things, and to assist in every possible way that trade revival which is now, even more than in 1901, our greatest national need.

There was much said by the speakers on Saturday night which will long be remembered by those who were privileged to be present. The tributes paid to the founder by Mr. RUNCIMAN and by the present head of the firm so clearly flowed from deep springs of friendly and filial affection and respect that even those who had never enjoyed the society of Sir JOHN BENN could not fail to gain the impression that a very great and lovable character had laid the foundations of a business which has become a national force and a force that is under progressive yet prudent guidance. In this connection we cannot refrain from remarking that, if, as Dean INGE somewhat wickedly suggested, the ghost of the notorious Sweeney Todd flits through Bouverie House, which now stands on the reputed site of that homicidal barber's shop, his evil presence has been so thoroughly exorcised by the wholly beneficent spirit of the founder that no member of the staff has even so much as suspected his existence.

THE ELECTRICIAN, although not an original member of the family of trade and technical journals, now numbering a round dozen, which form the Benn group, has been one of them for some fourteen years. It was in the dark days, half-way through the Great War, that the association began. In fact, it can be said that the present control of the journal has roughly coincided with the beginning of that new era of electrical progress in Great Britain which will, we believe, play a great part in the rehabilitation of our industrial life. Cheap and plentiful electricity can undoubtedly do a great deal to assist us to regain our former supremacy, but unless it is backed by other vital, if less material efforts, it will not by itself restore prosperity. It is in the mental attitude of employers and workers that the fundamental causes of success or failure must be sought. In this sphere we believe that the growth of the firm of Benn Brothers during the fifty years of its existence has in it a lesson which could be widely learned with great advantage to the nation. It is a proud boast to state, as Sir ERNEST BENN was able to do on Saturday, that in the whole course of its existence the firm had never sacked anyone for lack of trade. It is also contrary to most of the popular notions of the day that a constant effort to reduce the number of individuals engaged in particular activities should

Digitized by Google

lead to a progressive expansion in the total number of employees. In other respects, such as the five-day week and the profit-sharing schemes which have made nearly half the staff shareholders in the enterprise, the organisation, if not unique, has at any rate developed features which make for enthusiastic service and lead to healthy growth. The electrical industry is fortunate in that it is not in need of radical overhaul like so many of the other great industries of this country. Yet we feel that the report which we print in this issue of the speeches at the Jubilee Dinner, with the light that they throw on the principles which have guided the firm of Benn Brothers to its present happy condition, will be read by the electrical world with real interest, for its members can say with us that "while taking off our hats to the past we take off our coats to the future," with its great task of setting our country once more firmly on its feet.

An Old Feud.

FOR many years relations between the Post Office and the Marconi Co. were far from cordial, and although the Marconi radio system has now become part of the new Imperial Communications Co., the old hostility seems to be still in evidence. There is certainly no other easily discernible reason for the failure of the Post Office to agree with Imperial and International Communications, concerning the use of the company's wireless stations for long distance telephone services, and its persistence in developing its own system of radio telephonic communications. We await with interest the report of the Cabinet Committee under the presidency of Lord THOMSON which has been considering the protest that Sir BASIL BLACKETT (chairman of the I. and I.C. Co.) made to the Chancellor of the Exchequer concerning the attitude of the Post Office towards the company.

Cause and Effect.

IN spite of being offered at a discount of $2\frac{1}{2}$ the Central Electricity Board's issue of 5% Stock made little appeal to the investing public, the underwriters being left with 91% of the £7 000 000. Dealings began at $1\frac{3}{4}$ to $1\frac{1}{4}$ discount. This experience is symptomatic of the general rise in the yield expected from fixed interest bearing securities which has resulted from the weakening of the British Government's credit caused by the prospects of higher taxation and the general apprehension as to the nature of the next Budget. In the case of this particular issue it is possible that the uncertainty as to the outlook introduced by the Coal Mines Bill also exerted an unfavourable influence on investors.

Trade Outlook.

THE Federation of British Industries Business Barometer for the first quarter of 1930 is not a cheerful document. It is considered that the present situation has many points of similarity with that which supervened after the American crisis of 1893 and that time may have to be given for a recovery from a decade of falling commodity prices with its accompanying diversion of an excessive proportion of energy to retail activities as well as for reorganisation of the capital investment market and of the industries and occupations dependent on it. Appreciable progress may be achieved this year towards the reduction of short period money rates and in the direction of co-operation between American and Central European banks for the redistribution of their excessive quantities of gold or the expansion of the volume of credit on existing reserves all over the world. But the other requisites for a world trade recovery—willingness of investors to accept a smaller return on their savings and re-establishment of the foreign capital market on something more nearly approaching pre-war conditions—may take considerably longer to achieve. While there are grounds for anticipating a relatively early recovery in many directions, some time is likely to elapse before there is a resumption of a sustained general upward movement. Inspection of the curves covering the years 1926–1929 which accompany the F.B.I. Barometer reveals tendencies which are far from satisfactory. The only industries in which the employment curve shows a distinctly favourable trend are electrical engineering, coal mining, "other metal industries," chemicals and boots and shoes. The curve relating to our own industry, we are glad to see, is much the healthiest looking of the series.

English Electric Reorganisation.

THE proposals for the financial reorganisation of the English Electric Co., Ltd., are described by the directors as "drastic and unpleasant, but necessary." Yet if, as there is good reason to anticipate, the reduction in fixed charges and the provision of additional capital enables the company to bring its works to the fullest efficiency and, by increasing its output, to earn satisfactory profits the present surgical operation will be amply justified. We hope that it will restore the patient to financial health. The company's technical record is excellent and has brought it a large volume of business, in spite of the financial difficulties with which it has had to struggle during its decade of existence. Freed from their cramping influence it should soon be able both to expand its activities and make them profitable.

The St. Lawrence Project.

TWO Canadian engineers—the late Mr. HENRY HOLGATE, who, we regret to note, died last month, and Mr. J. A. JAMIESON—appointed by the Montreal Board of Trade to study the St. Lawrence Deep Waterway and power project have expressed very decided opposition to the scheme. They state that the power potentialities are 5 103 100 H.P. of which 2 903 100 is entirely Canadian. The Dominion is also entitled to half (1 100 000 H.P.) from the international section, making a total of 4 003 100 H.P., or almost 80 per cent., and leaving 1 100 000 as the American share. It is pointed out that apportionment of the cost of the works between water power and navigation would be difficult and the conditions are further complicated by uncertainty as to whether the Dominion or Provincial Governments would own the power.

Canada's Loss.

THE Empire as well as Canada has been deprived this week of a distinguished servant by the death of Mr. PETER LARKIN, who has represented the Dominion in London as High Commissioner for the past eight years. Shrewd, approachable and of a commanding presence, Mr. LARKIN in early life built up a large Canadian business from nothing. Within ten years he had acquired wealth. He has upheld Canadian interests on this side of the Atlantic while taking an Imperial view of his responsibilities and it will not be an easy matter to replace him. The palatial Canada House in Trafalgar Square, which took the place of the dingy premises in Victoria Street, is a lasting memorial.

JUBILEE DINNER OF BENN BROTHERS, LTD.

The King's Message—Notable Celebration of Fifty Years of Progress—Tributes to the Founder—Growth of an Idea Backed by Personal Courage—Factors in Success.

TO celebrate the Jubilee of the firm of Benn Brothers, Ltd. the firm held a banquet at the Wharncliffe Rooms, London, on Saturday, February 1st.

Sir, Ernest J. P. Benn (chairman) presided, and amongst those present were Lady Benn, Sir William Plender, Bart., and Lady Plender, the Rt. Hon. Walter Runciman, M.P., and Mrs. Runciman, the Rt. Hon. Wedgwood Benn, M.P. (Secretary of State for India) and Mrs. Benn, Lord and Lady Charnwood, Lord Ebbisham, Viscount Hambleden, Sir Hugh Bell, Bart., Sir Frank Newnes, Bart., and Lady Newnes, Sir William Lawrence, Bart. (Treasurer of the Royal Horticultural Society), the Dean of St. Paul's (the Very Rev. W. R. Inge), Mr. Arnold Bennett, the Finnish Minister and Mme. Saastamoinen, the Latvian Minister and Mme. Vesmans, the Lithuanian Minister and Mme. Bizauskas, the Esthonian Chargé d'Affaires and Mme. Mollerson, Sir Robert and Lady Welsford, Sir William Crawford, Sir Charles Mallet, Sir Cecil Walsh, Lady Brooke, Sir Arthur Shirley Benn, Mr. R. D. Blumenfeld, Mr. O. E. St. John Hornby, Mr. C. Lidbury (General Manager, Westminster Bank), Mr. H. P. Benn, Prof. R. S. Conway (a Trustee of "Discovery"), Mr. Gordon Robbins (deputy chairman, Benn Brothers, Ltd.) and Mrs. Robbins, Mr. B. G. Arthur, Mr. Percy Best, Mr. George Isaacs (General Secretary N.A.T.S.O.P.A.), Mr. A. Warne Browne (Secretary National Federation of Retail Furnishers), Mr. and Mrs. Claude Taylor (Exhibitions Branch, Board of Trade), and Mr. and Mrs. Frank H. Elliot, Mr. and Mrs. John A. Benn, Miss Betty Benn, Miss Benn, Miss Dorothy Benn, Mr. and Mrs. H. B. Crole-Rees, Mr. and Mrs. A. R. Pain, Mr. E. G. Benn, Mr. F. E. Hamer, Mr. and Mrs. E. E. Starke, Miss F. Robinson, Mr. T. M. Sparks, Mr. Norman French, Capt. E. W. Gregory, Mr. E. W. Carter, Dr. J. Gordon Parker, Mr. H. V. Taylor, Mr. A. J. Bonwick, Mr. H. W. Duck, Major W. N. Hills, Major H. Fletcher, Major A. I. Harris, Prof. J. W. Hinchley, Mr. F. Cassleton Elliott, Mr. H. E. Alden, the Rev. A. Taylor, Mr. F. M. Welsford, Mr. G. P. Baker, Mr. R. D. Savage, Mr. G. Russell Chapman, Mr. E. P. Tetsall, Mr. W. Hollins, Mr. G. H. Lepper, Mr. H. Taylor, Mr. S. H. Hodgkin, Mr. B. A. Glanvill, Mr. N. Foyle, Mr. W. E. Dedrick, Mr. G. G. Laidler, Mr. W. A. Gibson Martin, Mr. W. F. Harvey, Mr. A. E. Minshull, Mr. C. E. M. Joad, Mr. G. B. Harrison, Mr. Alan Thomas, Mrs. Pullein-Thompson, Mr. T. K. Bowman, Mr. Walter Blaber, Mr. F. Denny, Mr. H. A. Harnett, Mr. Evan Pughe, Mr. J. Gloag, Mr. F. Richardson, Mr. T. W. Griggs, Dr. Percy Dearmer, Mr. Eric Austin, Lt.-Col. W. A. Vignoles, Major T. Rich, Mr. W. W. Wilmott, Mr. A. H. Browett, Mr. H. W. Leonard, Miss Piper, Mr. and Mrs. B. C. Holding, Mr. F. H. Hallows, Mr. D. G. Rodger, Dr. G. W. Anderson, Mr. Wallace Coop, Miss E. L. Grimley.

THE KING'S MESSAGE

IN response to a loyal message sent by the chairman, Sir Ernest Benn, the following telegram was received :—

"The King is interested to hear that to-day you are commemorating the 50th anniversary of the foundation of your firm and, that on this auspicious occasion representatives of so many important trades are joining in the celebration. I am commanded to convey to all present the sincere thanks of his Majesty for your message of loyal greeting, and express the hope that every success may attend the efforts of your publishing house for the development of British trade.—CLIVE WIGRAM."

An interesting feature of the reception was the attendance of a guard of honour composed of fourteen members of the staff attired in costumes symbolical of the publishing activities of the Benn organisation The thirteen journals published by Benn Brothers, Limited, were represented as follows :—

THE CABINET MAKER —A carpenter (Mr. R. Edmonds).

THE HARDWARE TRADE JOURNAL —A blacksmith (Mr. W. L. Saunders).

THE ELECTRICIAN —Symbolical fancy costume (Miss M. Viner).

THE TIMBER TRADES JOURNAL —A lumberman (Mr. C. Mason).

THE FRUIT GROWER —A planter (Mr. L. Currell).

GARDENING ILLUSTRATED.—A gardener (Mr. E. C. Osborn).

THE BRITISH TRADE JOURNAL.—"John Bull" (Mr. A. Stevens).

THE CHEMICAL AGE —An alchemist (Mr. E. O. Piears).

THE NURSERY WORLD.—Peter Pan (Miss L. Cripps).

THE LEATHER TRADES REVIEW.—A leather worker (Mr. B. F. Lintern).

THE MILLER —A miller (Mr. W. McNaught).

DISCOVERY.—A Polar explorer (Mr. A. D. Holmes).

The fourteenth member of the guard of honour represented the book publishing activities of Ernest Benn, Limited, Mr. I. W. McDougall being attired to represent Chaucer.

The chairman (proposing the toast of The King) said: In view of the very exceptional nature of this gathering and occasion, I felt myself justified, and I felt I should be interpreting your wishes and expressing your feelings, if I sent a telegram of devotion and loyalty to His Majesty the King. I ventured to remind the King of a speech which he made in 1901 in which he called upon England to "Wake Up," and to tell him of the way in which we took advantage of that speech to found those Empire numbers that have been a feature of our business ever since.

Now, said Sir Ernest, I have the great delight and the very great honour to read to you a telegram which His Majesty has been graciously pleased to have sent in reply. (The King's telegram appears in the centre of this page).

I now give you the toast of His Majesty the King.

Sir William Plender (proposing the toast of "Fleet Street") said :—

There will always be a fascination about Fleet Street. Its past—remote and recent—recalls great figures, its religious communities are a memory, its old buildings are no more; but Fleet Street, the birthplace and home of the greatest Press in the world, still has and will always have its romance which the lengthening years cannot destroy. To-night we celebrate an eventful chapter in the history of the great publishing house of Benn. The old buildings, occupied by the firm, founded by the father of Sir Ernest, have been abandoned, and their vast business is now housed in a noble building which adds to the architectural features of Fleet Street; and we congratulate him on that achievement. But great as is the accomplishment of that effort, marking as it does a monumental episode in the Jubilee year of the firm's history, it will be no more enduring, and it is no more noteworthy than the high position which the firm of Benn occupies in the publishing world of Fleet Street through the untiring efforts, the unwearying energy and the genius of our honoured friend who presides over us to-night.

Dean Inge responded. For the purposes of this evening, he said, Fleet Street becomes Bouverie House. Fleet Street, which Dr. Johnson regarded as the very centre of the universe and the one place worth living in. I have no doubt that if he could revisit his former home, and have ascertained that the Benn family was not of Scottish extraction, he would have smiled very graciously on their activities. For fifty years this firm has been famous for issuing excellent trade journals, and more recently it has become famous as a publishing firm, and with very great enterprise it has endeavoured to put on the market very cheap and good books which will have a really wide and educating effect. I imagine that the work that is being done in that way is beyond all praise. Of the general character of Fleet Street as representing journalism in general, I have just one remark to make. It is popular taste which determines the character of our newspaper, and if there is far too much space given to subjects like betting and gambling and unsavoury crimes, the fault rests not with Fleet Street, but with the public which insists on having this fare served up to them. Therefore, what we have to aim at is to try to purify and elevate popular taste. I believe our hosts this evening are doing their very best in that direction. A great many of their cheap books I have read during the last year or two are most admirable, and I hope they are as widely read as they ought to be.

The Rt. Hon. Walter Runciman, M.P. (proposing the toast of "The Firm") said: I have the honour to propose the toast of "The Firm of Benn Brothers." I do it in many capacities: first of all as an old friend of the Benn family. Sir John Benn was one of my oldest and closest political and personal friends, and I venture to say that those who knew him, knew one of the most cheerful and courageous spirits who has ever appeared in the City of London. He was for many years in the House

Digitized by Google

of Commons, and he endeared himself to everyone who knew him.

Then the time came in due course for the head of the firm to become Sir Ernest Benn, and such a combination of courage and uprightness as was characteristic of his father soon became known in the enterprise of which he was the author, the inspiring spirit and the driving force. It is a great pleasure, Mr. Chairman, to be here in response to your request and to be one of your guests to-night. I think Sir Ernest is well justified in saying that his is now the largest trade publishing establishment in the Continent of Europe. It is a proud boast, fully justified by its record.

We are living in very dark and gloomy days. The re-arrangement of the values of the world on a stable basis has not yet been completed, but stability is one of the first necessities of our time. The time will come, very soon I believe, when we shall settle down to the new state of things. New levels are being found with great rapidity, but the mentality of investors, both in stocks and shares and in commodities, has been rudely disturbed by both economic and psychological causes.

British Commerce and Honesty.

We can only say that what has happened in London during recent months is not characteristic of British industry or commerce or finance. We can thank God that the real basis upon which British commerce has been built up has been honesty. We all take it for granted that those from whom we buy and those to whom we sell are honest men. Unless we started off with that axiom commercial life would be impossible. It is because that has been so deeply ingrained in our habits and principles that some of the most distinguished financial houses were so easily taken in during the last twelve months. It is not altogether to their discredit. They know how to meet their misfortunes, but the one thing they cannot insure against is the dishonesty of their customers. Let us still go on taking that honesty for granted, and let us believe that one of the reasons why London still remains, in spite of the war and the ambitions of other capitals, the financial centre of the world, is because our bankers, our financiers, our merchants are honest men who only issue honest paper, men who have attracted to the City of London the clearing of all transactions in the world because of their honesty, and men who will maintain her proud position because a three months' bill in London and the certificates of corporations and companies alike bear the value that is put upon them. So long as we maintain that character we need not fear as to the future.

Of one thing we can be assured, that so long as the great houses of the commercial world follow the example of Benn Brothers and call in their younger generations while they are still young, the prosperity of this Empire will return and be maintained. Because of its distinguished past, and its contributions to industry and commerce, as well as to literature, and because the head of this great establishment has been wise enough to call to his aid those who are the younger children of one of the best pairs of mothers and fathers ever born in England, that we rejoice with them to-night and wish continued prosperity to the firm of Benn Brothers.

Sir Ernest Benn replied: I have, he said, to apologise for the absence of the Lord Privy Seal, Mr. J. H. Thomas, who is confined to his house with a cold, and to express very deep appreciation of the delightful speech Mr. Runciman has just given us.

You will believe that this is a very proud moment for me. The first gathering of the staff which I remember was in 1887, in my father's sitting room in Finsbury Square, when we numbered all told fourteen or fifteen persons. If you care to take a still longer view and think of the rather under-sized boy of eleven, in his mother's Sunday boots, tramping from Stepney to Mincing Lane to earn 5s. a week as a messenger, and survey all the road from then till to-night, with an ex-President of the Board of Trade, the representatives of four European States, and this distinguished gathering to do honour to the enterprise he founded, you have a story not only full of interest, but with a very definite bearing on most of the problems that face the country to-day.

Work of an Individualist.

This business was founded upon an idea backed by personal courage, an idea which was scoffed at by all the experts of the day, and discouraged, so far as I can discover, by most of my father's friends. It is essentially the work of an individualist. It had no doles to support it, no facilities, guarantees, subsidies or any of those modern devices now thought essential to success in industry. Sir John conceived the notion that mahogany and eighteenth century design might be made popular at the end of the Victorian period, and he pushed that notion, against odds and in face of imminent bankruptcy, to the success with which we are familiar. I mention that to remind you that this business is founded upon a consciousness of serious purpose, and we are proud to think that most, if not all, that

The Jubilee Dinner—Some of the 450 members of the staff and guests who were present.

Digitized by Google

we have done from the start until to-day has something of the same quality behind it.

There are exactly thirty-four speeches, each of which would be appropriate to this evening's entertainment. I could talk at length upon the distinguished company which has honoured us by joining in our Jubilee Dinner. In the presence of cabinet ministers I should be glad to talk for half an hour about that other subsidiary, the Trade Promotion Trust, and endeavour to impress them with our belief in the great opportunities for the spreading of prosperity which lie in the development of consumer credit. I could keep you interested with a description of my wonderful tour of the Baltic States, but I must content myself with just acknowledging the delightful and generous hospitality that was so freely showered upon me last autumn. If any of you wish to know what it feels like to be a person of importance, take a trip to the other side of the Baltic Sea and let it be whispered that you are in some way connected with "The Timber Trade Journal." We are to-night especially grateful to the distinguished diplomats from Finland, Esthonia, Latvia and Lithuania, who have honoured us by attending.

I would like to make a speech to you about the policy of an all-working Board of Directors, to which we have just welcomed two very dear new colleagues.

The Five-Day Week.

My thirty-fourth speech would be about the five-day week which we established fourteen years ago, and, in our individualistic way, without any encouragement from anybody but ourselves, have maintained with great success ever since. If I attempted to deal with our profit-sharing or our saving schemes, or if I discussed the fact that nearly half the staff are shareholders, I should keep you here all night.

I should have liked the Lord Privy Seal to have been here to hear our views on employment, for we can claim to know something about employment in our own line of business. Our wages bill in 1880 started at £5 2s. a week, in 1926 it passed £50 000 a year, and in 1929 was £71 000. I am talking, of course, only of the publishing and administrative staffs which we directly employ. This growth is explained by a constant serious endeavour to get rid of work, to do without people, and to put one man into two jobs. We find that there is always a market for the product of work undertaken and executed in this spirit. But we have one or two little ideas of our own. In the whole of our history we have never sacked anybody on account of lack of trade. That does not seem to us to be an adequate reason for shirking our responsibilities as employers. But my difficulty has not been so much to find jobs to put men into as to find men to fill the jobs.

I take no credit for the truly remarkable spirit which permeates our concern. The basic ideas with which it is saturated came from the heart and the brain of Sir John, and such is their quality that they continue to live. We are "colleagues and friends in a great fellowship of work in which individual effort has been happily reconciled with central control" Perhaps the real secret is in the serious purpose of the business as a whole. No proposition which has nothing but profit in it makes any appeal to us. Our business is to print sense as distinguished from sensation, to inform rather than to inflame. Like most really good concerns, notwithstanding our phenomenal prosperity, no great personal fortunes have been made out of this business. Our aim is rather to found a solid institution. We work for profit, we have to balance our accounts, but we have never made from the nature of our work more profit than is necessary to give that balance and security which is essential to all. It is an open secret that in the recent industrial boom your proprietors might easily have become millionaires had they been actuated by no higher motive than mere personal gain.

What I have already said is sufficient explanation of the enthusiastic and delightful way in which the staff, as a whole, has adopted the John Benn Hostel. It is perfectly natural that an institution such as ours should not exactly feel the need, but rather take great joy in backing a great and good work founded as a memorial to our own late chief. We held recently what I believe to be the only bazaar that has been held in an office in the City of London, and a very successful function it was. You will, I know, be interested to hear that the Lord Mayor has been kind enough to place the Mansion House at my disposal on May 27th next for the third annual banquet of the John Benn Hostel, and you will also welcome the news that Viscount Astor will preside and the Lord Chief Justice will be the chief speaker.

Some people fail to realise that the creation and the establishment upon a sound and permanent basis of a great business is a two or three generation job. Our business, with all its success is not much more than a quarter developed even now. So that at our Jubilee Dinner, to borrow Mr. Duck's happy phrase, "we take our hats off to the past and our coats off to the future."

I am not always in agreement with Mr. Bernard Shaw, but I venture to use, by way of peroration, his words when I say "Life is no brief candle for me; it is a sort of splendid torch which I have got hold of for the moment, and I want to make it burn as brightly as possible before handing it on."

Mr. John A. Benn (proposing the toast of "The Staff") said: As a member of the staff it gives me the greatest pleasure to propose the toast of the staff. Every man born in the Benn family for half a century has taken part in the day-by-day work of the business.

In looking back over the names of the staff for fifty years past, there are many to whom special tribute might be paid. I will only say how glad we are to have with us to-night several whose connection with the firm dates back to the 'eighties, and others who have served as long with companies now amalgamated with Benn Brothers. We are particularly happy in being able to invite so many ladies to join our celebrations. From the outset Sir John Benn was guided in his career by my grandmother, who was with us at a staff gathering only two years ago. The keen interest she felt in the welfare of the firm is remembered by everyone. I think it is particularly happy that Lady Benn's portrait appears with that of our founder in to-night's menu card. The notion is still held in some quarters that women have unequal opportunities with men, but Benn Brothers have finally dispelled that notion. To-day we have fourteen editors and fourteen managers working under a single roof. That, Mr. Chairman, is an achievement of which every one of us can be justly proud. Here is a team of writers and business men in fourteen distinct trades, each with its own special problems and technicalities, which for expert knowledge it would be hard to beat. Our editors and managers deal on an average with 2 000 queries a week of a purely technical character, all of them vitally essential to the success of industry.

Mr. J. A. Knivett (responding to the toast) said: This is our jubilee celebration. It is the jubilee celebration of Benn Brothers and Sisters. It is, indeed, a great honour to me in having my name associated with this toast. Thirty years ago I joined the firm. The staff at that time consisted of about twelve members; to-day, as you have heard from our worthy chief, it numbers upwards of 350. It is gratifying to us, the members of the staff, to know that during the fifty years the firm has made such good progress.

Editorial Independence.

Mr. T. Mortimcre Sparks (Editor, TIMBER TRADES JOURNAL) also responded. He said: There is not an advertising manager, or even an editor, who is not intensely proud of his paper. Proud, too, are we, sir, very proud indeed, of the distinguished pilot under whose sure guidance there has been brought safely into the port of prosperity a group of papers as influential as, if not more influential, than any other group of trade papers in the world. If I and my colleagues on the editorial side deserve in any degree the kind things sometimes said of us, it must be largely due to the inspiration and fearless lead of one who is not only a prominent exponent of individualist thought and action, but who at all times encourages his editors to accept the responsibility attaching to the most absolute independence in the conduct of their journals.

The Right Hon. Wedgwood Benn, M.P., said: I should have preferred to address you as a close, discerning and grateful student of "The Confessions of a Capitalist," but I am really rising to ask permission to say a word on behalf of a body of which I am a proud member—the ex-members of the staff of the firm of Benn Brothers. It is 22 years ago since I ceased doing any active damage as a member of the staff of the firm. We lived then in quieter and more sedate times. We cannot claim any real part in this great enterprise as it exists to-day, but we can say we take a certain pride not only in its size and power, but in the reputation it holds.

Sir William Crawford proposed the health of the Chairman, and the toast was accompanied by musical honours.

The dinner was followed by a dance, a feature of the programme being a group of "dances of fifty years ago."

A telegram was received from Mr. W. E. Warrilow, the former publisher of THE ELECTRICIAN conveying best wishes for a happy reunion and even greater prosperity.

SURFACE CONDENSERS.

Some Operating Troubles—Their Cause and Avoidance—Types of Packing—Material for Condenser Tubes—Causes of Corrosive Action—Cleaning Methods.

By F. JOHNSTONE TAYLOR.

OF recent years the condenser has come to be regarded as a very important part of the equipment of a modern steam plant. While the various types of jet condenser function exceedingly well and possess the advantages of simplicity, cheapness and general freedom from trouble, surface condensers figure on most large plants, especially those involving high pressure steam and high efficiency turbines, and are, of course, invariably used in marine installations.

It would certainly at first appear that the passing of water through a series of tubes on to which the steam falls to be then extracted in the form of water and non-condensible gases could hardly give rise to any serious troubles provided the whole apparatus was properly designed and constructed for the duty expected from it, but actually in practice even the best condensers are by no means immune from operating troubles, the greater number of which can be summarised in the word " tubes."

The efficient working of a surface condenser is indicated by the maintenance of full vacuum, though the actual degree called for depends upon the plant as a whole. A relatively low vacuum may not be a very serious matter with a reciprocating engine, but with a turbine even a slight falling off in the vacuum means a relatively heavy loss of power and a direct increase in the coal consumption, so that the maintenance of condenser efficiency is often a vital matter in the operation of a steam plant.

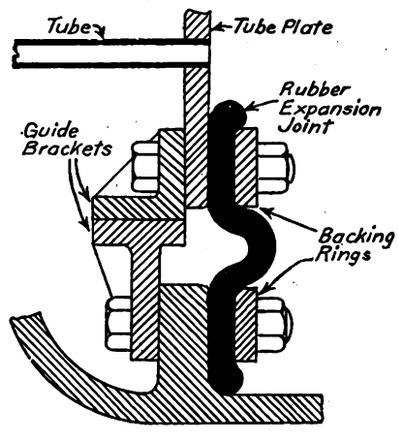

Fig. 1.—Rubber expansion joint.

It is hardly necessary to point out that deficiency of cooling water will soon upset the working of the best condenser, and the amount passing ought to be estimated periodically; this can be determined from the load and rise in temperature by the expression—

$$\text{g.p.m.} = \frac{1{\cdot}89P}{T}$$

g.p.m. denoting the number of gallons per minute of circulating water, P the pounds of steam per hour exhausted, and T the temperature rise of the circulating water in its passage through the condenser. If the amount of water is deficient it may be due to leakage in the pump stuffing boxes, while the condition of the piping and inlet tube sheet should also be looked to.

In the case of centrifugal circulating pumps, the water seal of the stuffing boxes may be the cuase of the trouble, and these should be supplied with water at not less than 15 lb. pressure.

Air, by blanketing the steam side of the tubes, greatly lowers the coefficient of heat transfer and decreases the vacuum. Excessive air leakage is indicated whenever a low vacuum, cold condensate and a normal rise in temperature of the cooling water are combined. Little air actually enters a condenser with the steam, the larger part leaking in through joints in the condenser and turbine casing at the l.p. end, and by way of small pipes.

In the case of large condensers a check should be kept on air in-leakage when a steam jet air pump is used, as the latter can easily be equipped with an air meter to measure the discharge, from which any undue increase will be readily apparent.

There are several points where air leakage may be suspected. The condenser shell joints quite often open through vibration loosening the bolts, and when there is overheating due to shortage of condensing water expansion and contraction has the same effect, and in addition the heat may soften the packing.

In the case of the turbine, the l.p. sealing rings require maintaining in good order, while at low loads the lower pressures in the lower stages are apt to set up temperature changes which are severe on the joints. Low pressure bleed connections may also be suspected, especially when the heater is vented back to the condenser, while all piping under vacuum should be regularly inspected.

A common defect in vacuum piping is the fitting of ring gaskets which extend to the bolt circle only, whereas full gaskets should be invariably used for vacuum piping to prevent their being sucked in if they become loose. The small air leaks which remain after inspecting the gaskets and tightening the bolts, may often be stopped by the use of a heavy asphaltum paint liberally applied along all joints. It is very desirable, too, to avoid small pipes wherever possible, such as those from the condenser to evaporator condensers or auxiliary condensers, for priming pumps or laboratory purposes. They are always a source of trouble by being extremely difficult to keep tight, and the leakage may easily be so great as more than to pay for the installation of separate steam jet air pumps or ejectors for these purposes.

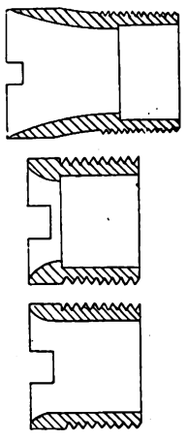

Fig. 2.—Types of ferrules.

Leakage of circulating water from the box to the steam space will do no harm provided that the water used is not deleterious to the boiler feed, but unfortunately this is frequently the case, and it is one of the conditions which dictate the use of a surface condenser in preference to a jet condenser. In practice it is a very difficult matter to make a condenser absolutely watertight, because conditions of expansion dictate the use of tube packings in at least one end. At least that is the usual construction, and something will be said about packings later on.

The expanded tube might be assumed to eliminate all packing troubles, though as yet its use has not become very general. To make use of tubes expanded into both tube plates, the one at the inlet has to be made smaller than the water box and fastened to it by a rubber expansion joint of the type indicated in Fig. 1, a simple yet effective arrangement designed by the American Wheeler Condenser Co. The weight of the tube plate and the tubes is carried by the two guide brackets, which being free to move horizontally one upon the other allow free movement of the tube plate with varying temperature. The guide brackets form a cradle support and are placed approximately 45 deg. on either side of the vertical centre line of the condenser. Bolts extend through the guide brackets and hold them to the tube sheet and water shell respectively on the steam side. The rubber expansion joint is of similar design to that used on large turbine exhaust connections. It is held by two backing rings bolted on the water side of the tube sheet and water box casting. The detection of water in-leakage may be effected by chemical analysis in the case of sea water or water containing chlorides in excess, using the well-known silver nitrate method, while those acquainted with electro-chemistry would have no difficulty in applying an electro-conductivity test to the same end. Alternatively, shutting down the steam side and measuring the water removed by the condensate pump will also reveal in-leakage.

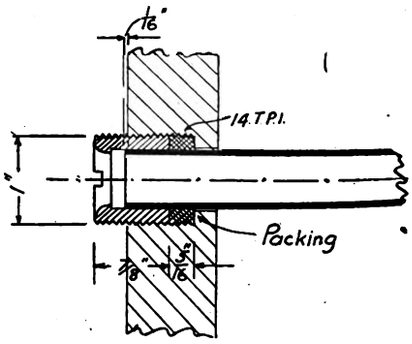

Fig. 3.—Standard B.E.S.A. ferrule.

Split tubes are often indicated by a visible increase in the quantity of water in the hot well. To determine the exact

Digitized by Google

location of a leak, the condenser must be shut down, the water boxes opened and the steam space filled with water, when leaks can be easily seen and rectified. In this connection it is necessary to remind the operator that the added load on the condenser may necessitate its being blocked up if it is normally supported from the turbine casing and on springs. Alternatively if the water boxes are drained and the air pump put in motion, leaks in the tube head will be revealed by a candle flame being drawn in at the points where the leaks occur. Condensers out of action for any length of time should be filled with pure water.

Before dealing with tubes and their defects it would be well to say something in reference to tube packing. The main object of the packing between tube and tube plate is to keep the vacuum in and the water out, but the design of this small component may play quite an important part in the efficient working of the condenser from other directions. It is essential that it should provide for smooth unobstructed flow, ease of fitting, ease of removal, non corrodibility and, obviously, tightness under all conditions. To this should be added inability to damage the tube when tightened up or removed. There are several different types of packing in general use, that formed with corset lacing impregnated with paraffin being perhaps the most usual, though not necessarily the most efficient. Yet, carefully made with the correct amount of paraffin and intelligently applied, with care taken not to tighten the ferrules sufficiently to crush the tube, it is very satisfactory.

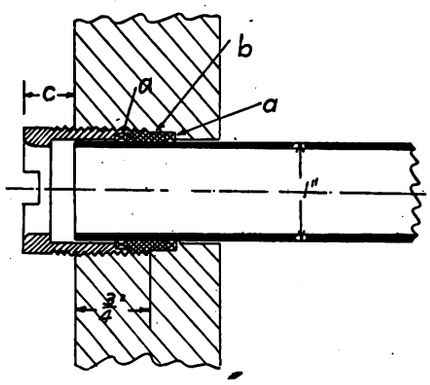

Fig. 4.—Two fibre washers and length of lacing.

In Fig. 2 are shown types of ferrule suitable for this packing, the top one being used when the tubes are expanded in one end, the middle one with a shoulder internally to prevent the creeping of tubes packed at both ends, while the lower one is recommended for condensers having a high water velocity. The standard B.E.S.A. ferrule is shown in Fig. 3. The packing usually takes the form of an asbestos ring compounded with graphite, which should be of a size easily slipped into the stuffing box with the fingers.

A method favoured by American engineers is that shown in Fig. 4, in which (*a*, *a*) are two fibre washers and (*b*) is a length of lacing. The ferrule is screwed into place and tightened to within $\frac{1}{16}$ in. of the tube plates as shown by dimension (*c*). The condenser is then heated up and the ferrule finally screwed to within $\frac{1}{16}$ in. of the tube plates, the holes being tapped to a uniform depth of $\frac{3}{4}$ in.

While both these systems are generally considered preferable to linen grummets, the latter are in fairly common use, and Fig. 5 shows the usual method of application. A hole is drilled and tapped in the tube plate (*a*) to accommodate the ferrule (*b*) through which the tube (*c*) passes, the black portion indicating the position of the linen grummet. The grummets ought, if possible, to be supplied ready made by the condenser people, but if they have to be made up, coarse linen soaked in beeswax and turpentine is recommended. The stitching, which should be done with a fine thread, should be on the inside of the grummet, and neither on the outside nor the edge, as this gives a tendency to distortion when the ferrule is applied. The threads should be thoroughly cleaned.

Fig. 6 shows a well-known form of metallic packing by the John Crane Co., which has recently come into favour. They are of special value where a condenser is equipped with an electrolytic system of combating the corrosion evil. The rings (*a*, *a*) are formed of spiral layers of very thin babbitt foil, while (*b*, *b*) are expansion rings. These rings are caulked by a special tool, and they do not depend upon the ferrule at all for tightness. In fact, screwed ferrules are not essential, and an alternative arrangement to the ferrule shown is one having a very large flange, which keeps the packing of the six surrounding tubes in position, and so eliminates some 85 per cent. of the screwed ferrules which would otherwise be required.

The selection of suitable material for condenser tubes has occupied the attention of the leading brass concerns for a number of years, both in Britain and America. It is doubtful if the ideal material for all conditions will ever be realised at a commercial price;* at the best one has to rely upon the best that can be produced by high class firms specialising in this particular commodity. Tubes are almost invariably formed of brass of some mixture or other, and those generally adopted in practice are the 70 : 29 : number "one" copper-zinc-tin mixture known as Admiralty metal and a 60 : 40 copper-zinc composition sold under the trade name of Muntz metal. The latter material is generally satisfactory with fresh water, and it is relatively cheap because it can be worked hot, which renders the manufacture of the tubes a comparatively easy matter. On the other hand, Admiralty metal with its admixture of tin is resistant to corrosion to a marked degree, and though fairly ductile when cold it cannot be worked hot, and is a costly metal. Muntz metal tubes are formed in the same way as copper tubes. That is to say, a cast billet is cropped and machined and a rough tube is made by the conical roller and mandrel system as applied in a somewhat similar manner to steel tubes. This rough tube is then cold drawn to size and annealed. In the case of Admiralty metal, the first process is that of casting a shell, a simple operation in itself, but in this particular instance calling for the utmost care in the making of the cores, as the shells must be absolutely free from any trace of gas bubbles. They are then bored and turned prior to the formation of the tube by a series of cold drawing and annealing processes. Tubes can also be made by the "cupping" process which is claimed to produce the very best tube, but its expense appears to be against its general adoption.

Final Annealing.

Apart, from the metal or the method of manufacture, the final annealing to which the tubes are subjected has an important bearing on their behaviour in service and the general practice is to finish them with a low temperature anneal. Condenser tubes are at the present time made to the standard engineering specifications which ensure, as far as possible, a straight tube of uniform thickness and bore, free from surface defects, hard enough to resist crushing at the ends or sagging between the tube plates, but not so hard as to risk season cracking.

Condenser tubes are liable to fail in four ways. Season cracking, for instance, results, as the previous paragraph would infer, from improper annealing whereby strains in the metal are not removed. It can be entirely avoided by proper manufacture, especially in the rigid control of the annealing temperatures at the different stages. Complete corrosion of the tube may occur as a gradual general thinning accompanied by slight de-zincification. It often occurs at the inlet ends of the tube if there is an opportunity for the accumulation of gases there due to the crushing of the tube under the packing. Generally, however, it results from a highly acid water, as, for instance, that from cooling towers, which is apt to become concentrated. One should not be too ready to blame the makers for this defect, though a properly mixed and tempered tube, not damaged in handling, would be slow to fail in this manner. De-zincification is often the result of vibration and or high water temperatures. The streaks of practically pure copper often seen in Muntz metal tubes which have (improperly) been used with salt water are frequently attributed to an original segregation of copper and zinc in spots. It is, however, purely a chemical condition; mechanical segregation is impossible as the copper and zinc are soluble in one another, forming a homogenous solution. Actually it would be impossible to manufacture a tube from a segregated billet, because it would be devoid of strength. Perhaps the most common trouble of all is pitting or local action. The deposit of foreign particles carried by the circulating water may cause a local cell action at the point of deposit, while pitting may

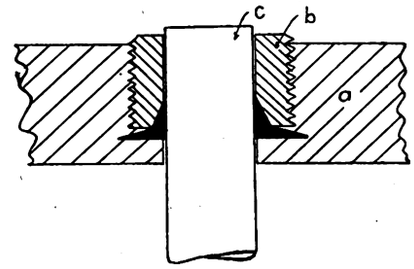

Fig. 5.—Use of linen grummets.

* The writer understands that Monel metal tubes c/20 gauge are new offered at 5/- per lb., which is about 50% over the cost of the best brass tubes, and they are coming into favour with the steamship companies.

Digitized by Google

also be caused by excessive local heating such as would result from steam directly impinging on the tubes. In this case the action is assisted by a certain amount of erosion. Generally speaking pitting can be kept in check by maintaining a fair water velocity in the tubes to keep them clean, while direct impingement of the steam on the tubes is a matter for the designer.

At the present time those who have to operate large condensers working with turbines designed for a high vacuum are a good deal troubled with tube corrosion, so much so, in fact that several investigators have been at work during the past few years seeking the cause and possible remedies. From a study of the various instructive papers relating to the subject it is generally agreed that the appearance of the affected tubes is that of nibbled or water worn material, but under the microscope the actual metal is seen to be very smooth, rather than roughened as with ordinary metallic corrosion. The attack, moreover, is frequently distributed over a considerable length of tube, in place of being confined to an isolated area. The whole circumference and two or three feet of its length may be affected, or it may occur at the top, the bottom or sides of the tube quite indiscriminately. Again, a small amount of cuprous oxide may be present and some ferric hydrate from the water ends, yet there is little blue or green basic salt and no metallic copper. This corrosive action is most commonly found in the first pass towards the ends of the tubes at which the water enters, and generally within the first three or four feet. The first inch or two is not as a rule attacked, except in very severe cases. The remainder of the tube may be unaffected, although in the case of long tubes it has a tendency to break out again near the outlet end. It has been found that tubes not so attacked during the first few weeks of their life are usually immune from rapid corrosion.

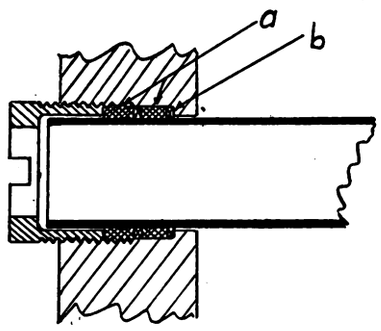

Fig. 6.—Crane metallic packing.

There is, however, an element of uncertainty as to the liability to attack in similar condensers working under similar conditions; the tubes in one may fail in a few weeks, and yet in the other case last for several years. A large number of tubes have been examined closely, and while a good many mechanical defects were apparent, neither the composition nor mixing of the alloy seem to be conducive or otherwise to corrosion. Neither have mechanical defects been proved to be in themselves a cause, though when corrosion has set in such defects naturally hasten distintegration. The proportions of the mix appear to have no appreciable effect except in the case of tubes with a high nickel content which are the more resistant.

The troubles, therefore, appear to lie elsewhere, and observations of water flow have revealed turbulent motion and entangled air. The subsequent impingement of the entangled air on the tubes is regarded a very potent factor in the cause of corrosion. Not so much in respect of its amount, though, as in its fine subdivision in the form of foam.

Then there are the observations conducted on a large scale by Sir Chas. Parsons and communicated in a paper read before the Institute of Naval Architects in April, 1927, and which relate specially to the matter of occluded gases from the water which cause corrosive action at the tube entrance. It has frequently been observed that tubes are eroded, corroded, pitted and eventually holed, but always, or nearly always, from the water side. The action is usually confined to tubes in certain regions of the tube plate, and if such tubes be replaced from the common batch they usually fail just as quickly, while in other positions in the tube plate the original tubes have remained immune so that there appear to be distinctive areas in which the conditions favour corrosion or erosion. Further, it appears that the action is greatest at the entry ends of the tubes, frequently extending only a few feet from the mouth. Facts which seem to suggest that the cause may be hydrodynamical rather than electrical or chemical, and that the areas of corrosion and erosion as previously suggested are associated with regions of turbulent motion in the water box.

The scale which is known to form on a condenser tube is of different composition under different conditions; that, for instance, forming on a brass tube contains not only the constituents formed from copper, but also some formed from the zinc—probably zinc hydroxide. If this scale is highly pervious it will afford little protection against corrosion, on the other hand if it is a more or less impervious it will serve to delay attack, if not to wholly prevent it. This matter of scale formation is highly important. Entangled air will set up water hammer which, while ineffective on clean metal, will destroy the scale, and sea water, which will foam, is very destructive in this direction. Temperature also has an effect upon corrosion, it being more rapid at low temperatures than at high ones, a fact which accounts for the more rapid corrosion in high vacuum condensers as already noted. An increase of temperature has the effect of assisting the deposition of metallic copper, this in turn favours the formation of a scale consisting of zinc hydroxide, basic carbonate and oxychloride. This latter constituent confers on the scale a property of partial permeability, and when in large amounts so strengthens and hardens the scale that, once formed, it is not easily destroyed. Yet it is somewhat permeable, and corrosive action may go on underneath it.

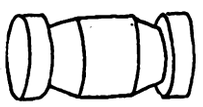

Fig. 7.—Rubber plug.

If, however, as undoubtedly it does do, scale forms a natural protective agent, there is an argument in favour of artificially "seasoning" the condenser by the slow circulation of sea water prior to its being put into operation, and the use of tubes which have been previously artificially "seasoned" in a similar manner. But perhaps the best method of dealing with the corrosion evil is that due to Mr. H. Austin, of the Cunard Line, who, as superintending engineer, has had a large experience with condensers operating under every conceivable condition except, perhaps, those using dirty water. It involves the simple and inexpensive procedure of coating the water side of the tubes with bituminous solution, though to do so rapidly and cheaply when one has to deal with, perhaps, several thousands of tubes, calls for suitable equipment. This, as used by Mr. Austin, is an ingenious adaptation of the compressed air paint spray which it is not necessary to describe in detail.* The system has, however, proved very effective in combating tube corrosion. The main points to ensure success are to have the tubes thoroughly dry before spraying is commenced by admitting steam into the condenser immediately prior to applying the coating and to apply two or three very thin coats rather than one thick one. After the spraying of each tube surplus solution is wiped from the bottom of the tube by means of a spiral form of hair brush passed through it.

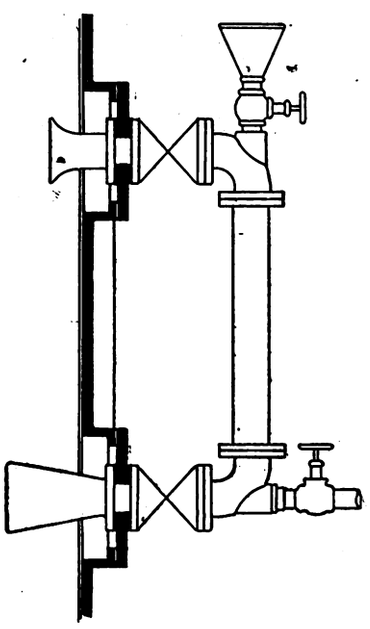

Fig. 8.—Apparatus for removing hard scale.

Corrosion, it will have been seen, is an evil which may well occur with the clearest of sea water, but dirty water, which power station engineers frequently have to put up with, introduces another trouble, that of fouling. The average river and canal water contains plenty of material to cause slime, even though the heavier matter is excluded by means of a modern rotary strainer. When troubles of this class occur it is a good idea to make investigations as to whether the trouble is due to colloidal or organic matter, rather than to pure mechanical deposit of silt. "Dirty" water has a peculiar property of creating, through the micro-organisms contained in it, a gelatinous slime in the tubes of condensers, a condition

* The apparatus is described and illustrated in "Marine Engineer" March, 1925.

Digitized by Google

favoured by the heat being abstracted from the tubes. When this condition is in evidence the evil may often be combated by the use of chlorine. The injection of very minute quantities of chlorine into water is now quite an everyday feature of water purification, and the apparatus for doing so is adaptable to dosing condensing water. This has the effect of preventing the formation of the slimy deposits referred to, which considerably lessens the labour of cleaning and undoubtedly assists in maintaining full vacuum at all times.

Mechanical cleaning methods would have to be adapted to the nature of the filth encountered. Silt or loose sediment can be removed by a water jet, while divided condensers are cleaned by the obvious means of shutting down one-half and using the high velocity of the full volume of circulating water through the other. Then the condenser can be drained of water and steam heated, which, by drying the deposits, often facilitates their removal, as under this treatment they usually crack and tend to flake off the tubes. Then a certain amount of cleaning can be done by suitable tube brushes, but it is rather a slow process, and rubber plugs of the type shown in Fig. 7 are often resorted to; these are shot through the tubes by air pressure, but in this connection it should be noted that some classes of tough deposit such as iron hydroxide are apt to pack under the influence of the plug and form a thin, though very tough, coating of heat resisting scale, rendering matters worse than before. There are, however, various forms of mechanical scraper which can be air-shot through the tubes. But whatever form of mechanical cleaner is used it must always be borne in mind that condenser tubes, unlike boiler tubes, are relatively soft and can easily be damaged by rough treatment or excessive abrasion.

Removal of Hard Scale.

For hard scale, resort has to be made to chemical methods, but extreme care is necessary in their use. Hard calcareous scale is amenable to treatment on these lines by a weak solution of hydrochloric or muriatic acid circulated through the tubes, afterwards thoroughly flushing out the condenser to remove all trace of this corrosive liquid. The apparatus generally fitted to condensers for this purpose is shown in Fig. 8.

In operation the condenser is filled up with clean water, the two valves leading to and from the condenser are opened, and steam is turned on to the ejector at the bottom. By this means water is sucked through the upper bell-mouthed opening and discharged through the lower perforated cone. When circulation is thus established the cleaning agent is poured into the upper funnel and the cock opened through which it is entrained and diffused into the cleaning water. The process may take several hours according to the quality and amount of the scale.

Bearing in mind the corrosive action of acids and especially the commonly used muriatic acid, some protective measure against its effects is desirable. This takes the form of adding certain colloids to the cleansing solution. These are obtainable from chemical manufacturers, and in addition to forming a safeguard against corrosion, permit of the rapid carrying out of the cleaning process. The trouble with chemicals used without a protective agent is electro chemical action between the tubes, the steel end plates and the iron body. The iron forms a negative pole, so that the brass is first protected through the iron, assuming good metallic contact between the tubes and the end plates.

After a time a reverse current occurs when sufficient iron has been deposited on the surface of the condenser and the graphite contained in the iron has been left on the surface of the metal. This carbon then composes with the brass tubes, the brass then acting as the dissolving electrode; thus a very considerable corrosion of the brass is introduced. The addition of colloidal organic substances causes the formation of capillary active protective lining through which the acid is kept away from the iron. If this is done the solution may be warmed, and this makes its action much more rapid.

It is hoped from the foregoing that the reader will have realised that a surface condenser, while a more or less uninteresting piece of apparatus, requires to be treated with respect. A good condenser designed and constructed for a given duty will, when installed by a first-class firm, perform that duty, but after a time there is more or less bound to be a falling off in its performance as indicated by a reduction in the vacuum or considerably enhanced duty of the air and circulating pumps to maintain it. To do so is a matter of prime importance, especially with turbines, because every fraction of an inch of vacuum lost means either so much loss of power for the same steam consumption or an enhanced steam rate per H.P., reflecting eventually on the fuel bill. Condenser troubles are now pretty well defined and understood by designers and builders: these notes are intended to be of assistance to those who operate steam plants, and are responsible for the proper functioning of such condensers as may come under their charge.

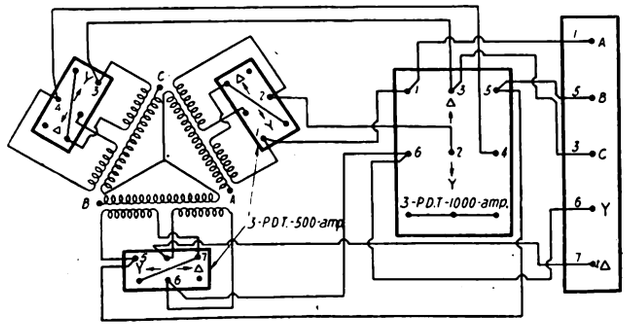
REPAIRS AND CHANGEOVERS.

Utility of Portable Transformer Bank.

By J. DUDLEY PEASE.

FREQUENTLY during repair work or system changeovers from delta to Y secondaries, it is necessary to provide continuous and adequate service. Often the installation of a temporary transformer bank has proved expensive as it is in use only for a few days or hours.

One company has found a portable transformer bank mounted on a trailer of considerable value. It has facilitated such changes with a minimum of cost and interruption to



Connections of portable transformer bank.

service. The trailer is equipped with three 100 kVA single-phase transformers connected as shown in the accompanying illustration and forms a very flexible set.

Primary cables enter the trailer through the roof, pass through 100 ampere primary cut-outs and thence to the transformers. A pothead is installed in the primary neutral, so that the neutral may be opened for the closed delta connection, and closed for the Y connection. Simply by throwing three two-pole and one three-pole double-throw switches either a delta or a Y connection can be made.

Conductors of 800 000 circ-mil cable connect transformers to switches and switches to terminal board where the secondary supply cables which enter the trailer through the floor may be shifted quickly either to the delta or Y connection. A colour scheme is used to mark the delta and Y connections in order to prevent the operator from making a false connection.

STEAM TURBINES FOR ELECTRICAL PLANT.

THE British Engineering Standards Association has recently issued Specifications Nos. 132–1930 and 215–1930, both of these being revisions of earlier specifications. No. 132–1930, a revision of the 1920 edition of this specification, deals with steam turbines and has been in preparation for several years, the work having been carried out in parallel with the international specification for steam turbines by the International Electrotechnical Commission. It is interesting to note that so close has been the co-operation between the British and the International Committees that the new edition of B.S.S. 132 is, to all intents and purposes, identical with the International Specification as tentatively agreed by the I.E.C. Advisory Committee at the meeting in London in July last. It is also of interest to note that, whereas the 1920 edition of the Specification was confined to steam turbines for electrical plant, the new Specification is not restricted to turbines for use in connection with such plant. Considerable attention has been paid by the Committee responsible for this Specification to the list of recommended standard ratings, an endeavour having been made to restrict the standard sizes to the fewest possible number. In this matter the Committee has had the advantage of the close co-operation of the Electricity Commissioners in so far as home requirements are concerned, the result being that the list of standard ratings, although given only as a recommendation, represents a thoroughly practical series of sizes for home and export purposes.

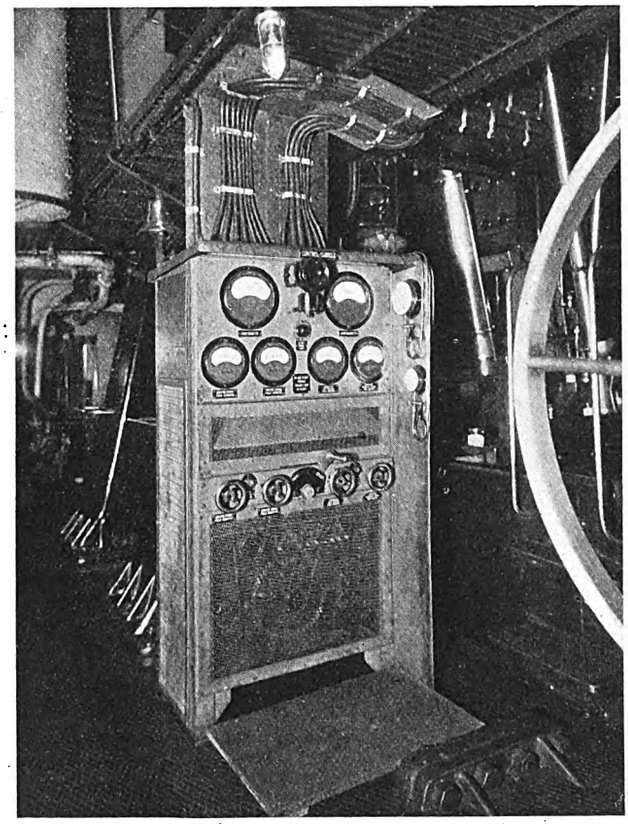
MARINE ELECTRICITY.

Advances in Turbo-Electric Propulsion—Where Diesel-Electricity is Supreme—Return of the "City of Hong Kong."

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types," etc.)

IT is instructively indicative of the all-round progress which marine electricity is making that whereas a year ago an article under this heading published in THE ELECTRICIAN of February 1st, contained very little other than theoretical suggestions as to the application of electric propulsion in this country, and news of actual construction of important electric ships only in America—to-day one can record nearly a year's operation of the first big British turbo-electric liner, the definite placing of contracts for two further larger ships for the same company and the re-electrification of an important small fast fruit carrying ship.

This represents to the electrical industries many thousands of pounds of potential and actual work. It represents to the shipowner further food for thought and yet another problem to solve when he is considering the ordering of new tonnage, and just how much the electric ship is beginning to mean to shipowners who have hitherto shown very little practical interest in its advancement, may be seen by the persistent rumour that the Furness Withy Co. are to build a turbo-electric



The control cubicle of the "City of Hong Kong."

vessel for their fast service between New York and Bermuda. It is just over two years ago since they took delivery of the 19 070 tons gross "Bermuda" for this service, a vessel of 11 250 brake horse power with accommodation for 616 first class and 75 second class passengers. This ship has given nothing but satisfaction since the day of her completion, and the measure of her success may be judged by the fact that although she was designed obviously from the point of view of being able to be used for world cruising, she has never yet been taken off her New York–Bermuda route.

It would appear then that the owners must be entirely satisfied with their choice of Diesel engines for this ship, but that they have been unable to remain impervious to the march of progress, if such this be, and to refuse to consider the possibilities of the electric ship. I have always felt that the turbo-electric ship would one day constitute a serious rival to the Diesel-propelled ship, just as it will prove the most potent weapon by which steam will come into its own again.

The "Bermuda" operates regularly from New York, which in effect is her home port, although she is a British ship, and in New York those responsible for her operation must have had ample opportunity for observing the operation of the increasing number of electric ships which regularly use this port. Possibly, again if the rumour is correct, this may in some way have influenced their choice.

These new American electric ships about which so much is written, and concerning which exactly a year ago there was published in these columns a very interesting table of costs, have, in effect, established a marine electrical technique of their own and it is interesting in them to see that very few of the original ideas of layout for electrical machinery at sea have been followed. The tendency has been not to separate propelling motors from the generating plant with the consequent apparent gain in space and the elimination of a long length of shafting, but rather to concentrate on propelling motors, compact turbo generators and equally compact high pressure, high superheat water tube boilers in a small space, which in some ways approximates to that occupied by the very best airless injection supercharged Diesel machinery.

As an example of what we mean by this we have only to consider the case of "La Marea" which is now undergoing complete re-electrification in Belfast. This ship completed originally in 1924 had Diesel electric propulsion. For various reasons this has been now removed and the latest type of turbo-electric propulsion substituted, and although the substitution has cost the shipowners something like 30 ft. in length, for the ship has had to be lengthened that amount (and, of course, the necessary power to propel this extra 30 ft.), the result may be looked upon as one of the latest and most up-to-date interpretations of small ship electric propulsion that we yet have, and it certainly is worth the attention of every shipowner to see what has been done.

Nine Years' Progress.

In particular, it is worth contrasting "La Marea" with one of the earliest turbo-electric ships completed in this country, fitted out, incidentally, by the British Thomson-Houston Co., as is also "La Marea." The older vessel is the "San Benito" completed in 1921. Her main turbo-alternator, with the turbine running at 3 000 r.p.m., delivers current at 1 100 V. It takes steam from three Scotch boilers at 190 lb. per sq. in. pressure and 200 deg. F. superheat. "La Marea," under her new arrangement is to have a boiler layout giving steam at 400 lb. per sq. in. pressure and 710 deg. F. superheat. The boiler is a special Babcock and Wilcox unit and is fitted with an air preheater. Examination of the general arrangement plan of the "San Benito" is indicative in other ways of the advances that have been made in turbo-electric propulsion. In considering this somewhat older arrangement, however, we should remember that whereas in the earlier days electric propulsion was fitted more or less experimentally, and very often half apologetically, to-day it is fitted with a definite purpose in view, although even now we must remember that this definite purpose certainly does not show up in the fuel bill, but rather must be assessed to such matters as flexibility, long life of machinery and manoeuvrability, as well as ability to cruise at low speeds with great economy.

Alternatively, in the case of a ship like "La Marea," which is a fruit carrying vessel with high auxiliary load, to be able to obtain cheap electricity for driving and refrigerating machinery, fans and other equipment, and yet to show, perhaps, how vague was the conception of marine electricity in the days when the "San Benito" was completed, it is amazing to realise that the cargo refrigerating engine is steam driven, that the three auxiliary generator sets are driven by relatively slow-running vertical reciprocating engines, that the main circulating pump has for standby purposes a steam engine to drive it as well as the electric motor. The three Scotch boilers are arranged in a separate boiler room, two alongside each other and one forward of the pair. They are surrounded by fuel oil tanks and it seems safe to suggest that the space they take up is probably double that which will be required for the boiler installation on the reconstructed "La Marea."

Thoughts engendered by small electric ships such as these suggest that a dogmatisation on the respective spheres of Diesel-electric or turbo-electric propulsion is in some ways

Digitized by Google

more difficult than it has ever been, and although one still contends that the electric ship will never have universal application, will never even have the catholicity of application that the motorship has to-day, it must inevitably find much use for passenger liners, for vessels with refrigerated machinery and for high auxiliary loads, and for a diversity of harbour craft.

It is in these latter that Diesel-electricity will possibly find its biggest appeal, although every new ship, steam or motor, that is completed goes to show that for auxiliary purposes Diesel-electricity is unquestionably, merely on grounds of economy, supreme. In which connection it is interesting to note that the P. and O. Company is reported to have decided on horizontal Diesel engines for auxiliary purposes on its new big turbo-electric liners. It has often been urged in these pages that, foreign though it may be to marine ideas, the horizontal prime mover of " Diesel-electric " type has a great deal to recommend it in connection with generator sets for auxiliary purposes or even on certain ships for propulsive purposes. At least one shipping company has now decided to go in for this type.

Whilst discussing Diesel engines for auxiliary purposes, a rather interesting case comes to mind which I believe is the first, if not the only case of its kind in which at sea on a direct driven Diesel engined yacht the generator sets can be cut out entirely, because on the two main Diesel engines the fly wheels are dispensed with, and a.c. type generators substituted. The generators which replace the fly wheels are separately excited three-phase 70-cycle units supplying current at 220 V. They have each a 10 kW output and run at the same revolutions, thereby eliminating all vibration. As has been mentioned these generators supply all the current needed to be used at sea, and the electric equipment of this yacht, which is only 160 ft. in length and has a total shaft horsepower of 1 000, is exceptionally complete, containing such comparative luxuries, viewed from a merchant ship angle, as automatic steering arrangements in association with gyro compasses and a gyro stabiliser. In effect, this arrangement from a layout point of view seems to be a variation of the idea of having belt-driven generators, and it would seem quite a good idea if it were possible to operate storage batteries in conjunction with the arrangement.

It has an interesting variation also of another important machinery arrangement, which is an electric motor on the main shaft, namely electric " supercharge," and in this connection it is now necessary to put on record that the " City of Hong Kong," the first ship to be fitted with electric supercharge (the Metro-Vickers unit) has successfully completed her maiden voyage to Indian ports and returned to Manchester.

It is stated that the auxiliary turbo-electric drive was in continuous operation throughout the voyage and gave complete satisfaction. On the return journey very heavy weather was encountered in the Bay of Biscay but, owing to the electric super-charge, it was possible to maintain a higher speed than had been possible on any previous occasion under similar conditions, mainly due to the steadying effect of the electrical equipment which eliminated propellor racing.

This is an important point which shipowners unquestionably are carefully noting. The even turning moment of the electric motor, superimposed on the varying torque of the reciprocating engine, besides decreasing the engine vibration was found to have reduced the wear on the main bearings and also the wear in the cylinder so that the usual overhaul at the end of the trip was found unnecessary. This auxiliary turbo-electric drive or electric supercharge is one of the most important recent developments in marine electricity.

Further details of the " City of Hong Kong " are illustrated in this article. The net saving with this ship, it is claimed, as a result of fitting electric supercharge, has been about 27 per cent. as compared with previous voyages. It is not stated, however, how this figure is arrived at, but it may be taken that the ship has been eminently satisfactory.

ENGLISH ELECTRIC PROSPECTS.

What the Reorganisation Means.

FINANCIAL details of the important reorganisation scheme which is now before the shareholders of the English Electric Company, Ltd., are summarised on page 185 of this issue. There are, however, certain aspects of the proposals which deserve to be emphasised. In the first place, the reorganisation plan involves no alteration in the all-British character of the undertaking. Secondly, it will provide £750 000 of fresh capital, which will be available for the re-equipment of works with the most modern plant and tools, in addition to effecting a reduction of £110 000 per annum in fixed charges. It is well known that the depreciation allowance permitted under the present income tax law is quite inadequate in view of the rapidity with which machine tools and other plant become obsolete, and in these circumstances it is impossible to provide adequately for replacements before earnings become liable to income tax. The effect is to add a minimum of 20% to the cost of all replacements outside the amount which can be legally set aside for depreciation. The new capital which the English Electric Company will obtain if the plan is approved by shareholders will enable it to overtake arrears in this respect, and thereby improve the efficiency of its works. With the additional help of the large reduction in fixed charges a return to the payment of reasonable regular dividends should be brought within sight.

The English Electric Company is just over ten years old. It was formed at the end of the war as a combination of the Dick Kerr Works, the United Electric Car Works of Preston, the Coventry Ordnance Works, the Phœnix Works, Bradford, and the Siemens Works, Stafford. The company also controls Willans and Robinson, and is interested in the Siemens and English Electric Lamp Company and the English Electric Company of Canada. The company's works at Rugby, Preston, Stafford and Bradford are engaged in the manufacture of a great range of electrical machinery and apparatus, and the comprehensive Contract Department at Rugby has handled and is dealing with many schemes of large size in this country and abroad. Of the latter the installations at Athens, Budapest and the Tata Company's undertakings in the Western Ghats may be mentioned. In the hydro-electric field the English Electric occupies a unique position amongst British companies.

During its career the company has carried out a large number of large electric traction contracts in South Africa, India, New Zealand and South America as well as the Post Office tube in London, which presented intricate problems requiring special treatment. The equipment of Brookman's Park represents another branch of the company's activities in which the development of h.t. d.c. generators up to 20 000 V for radio work is a feature. Electric welding plant forms a flourishing department. Much attention has been given to power factor correction in a.c. work, and switchgear has become one of the largest individual departments. Every size and type of transformer is now made. Export trade is said to show a definite improvement since a year ago. Although the Australian outlook is somewhat clouded, so far little effect has been felt in this field, and good orders for motors of mill type are being supplied. The demand for motors in New Zealand is good, and India has proved a valuable outlet, particularly for Fullagar and Diesel oil engine plant. An improvement in the South American and Canadian markets, which have not hitherto been as productive of orders for British electrical plant as they should be, is regarded as a likely development of the immediate future.

PATENT LAW REFORM.

Major H. Fletcher Moulton in a recent lecture on "Some Desirable Changes in Patent Law" before the Institute of Patentees said that we should approximate our law to that of the United States by permitting a patentee to obtain a patent even if he had disclosed the invention, provided that he applied within six months. The Patent Office search of this country should be extended to include foreign specifications and standard text-books, but if the patent showed something which was new in view of those searches, the patentee should be allowed to obtain a patent as at present at his own risk as to subject matter. It might be advisable in some cases, to permit of the system of regrant where, by error, the true invention had not been claimed.

THE R.B.C.B. STANDARD TOTALISATOR.

An All-Electric Machine for the Racecourse Betting Control Board—The Apparatus at Thirsk Described.

AS is already known, betting by totalisator involves the return of the whole of the stake money to the successful backers—less a small percentage by way of tax or commission to cover expenses. In its earliest form the system was worked by hand, and the results made known to the public by means of a manually operated indicator. Later, mechanical means were devised, both for registering the bets, totalling them, and displaying the results on an associated indicator, the mechanism being driven by electric motors. The adoption of totalisator betting on British racecourses in July, 1929, soon made apparent the inadequacy of the older, manual method of calculation, involving, as it did, large staffs, and the possibility of error; whilst existing mechanical totalisators were considered too unwieldy and inflexible. To meet the demand for an all-electric totalisator, the British Thomson-Houston Co., Ltd., and Automatic Telephone Manufacturing Co., Ltd., reviewed the possibility of adapting Strowger automatic telephone exchange mechanisms and circuits to a solution of the problem. As an outcome a totalisator, free from inertia, and meeting all the requirements of the Racecourse Betting Control Board, has been designed, and a six-horse demonstration equipment was viewed by a representative of THE ELECTRICIAN on January 28th at Thirsk racecourse, when its possibilities were exhibited and its principles explained.

Components of the Installation.

The R.B.C.B. Standard Totalisator incorporates two well-known components of Strowger automatic telephone equipment, the horizontal automatic relay and the heavy duty rotary line switch. A complete totalisator installation of this type comprises ticket issuing machines; various Strowger switch and relay groups, mounted as detachable units, on single-sided racks, an indicator, and a central control board. The ticket issuing machines installed at Thirsk were made by the Bell Punch and Printing Co., Ltd., and depression of the various keys in response to the requests of backers closes electrical contacts and sets up series of impulses which actuate the Strowger mechanism, only ten wires, apart from battery leads being required between an 80-horse ticket issuing machine and the Strowger switch and relay groups of the main equipment.

The number of ticket issuing machines in use and their location is determined by the nature and magnitude of the race meeting. Suffice it that any desired number can be accommodated, and that there are different machines for the five denominations or values of individual stakes—viz., 2s. (the unit), 10s., £1, £10 and £100.

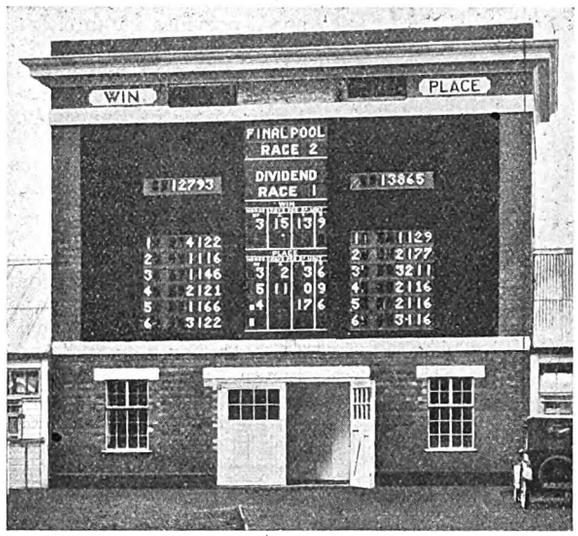

Fig. 1.—The standard R.B.C.B. totalisator at Thirsk, showing the front of the demonstration indicator.

From the ticket issuing machines the circuits (ten wires per machine) pass to the main equipment, which comprises the following Strowger switch and relay groups. The "place" change-over relay group consists of a number of relays, the function of which is to discriminate between "win" and "place" bets before these reach their respective adding machines for registration. The decoding relay group receives the signals over the ten wires from the ticket issuing machine, transforms them into their corresponding betting equivalents, and, if all is in order, passes them on for registration by the adding machines. This group responds to operation of the horse number and "win" or "place" keys on the ticket issuing machine, making the corresponding selection. On

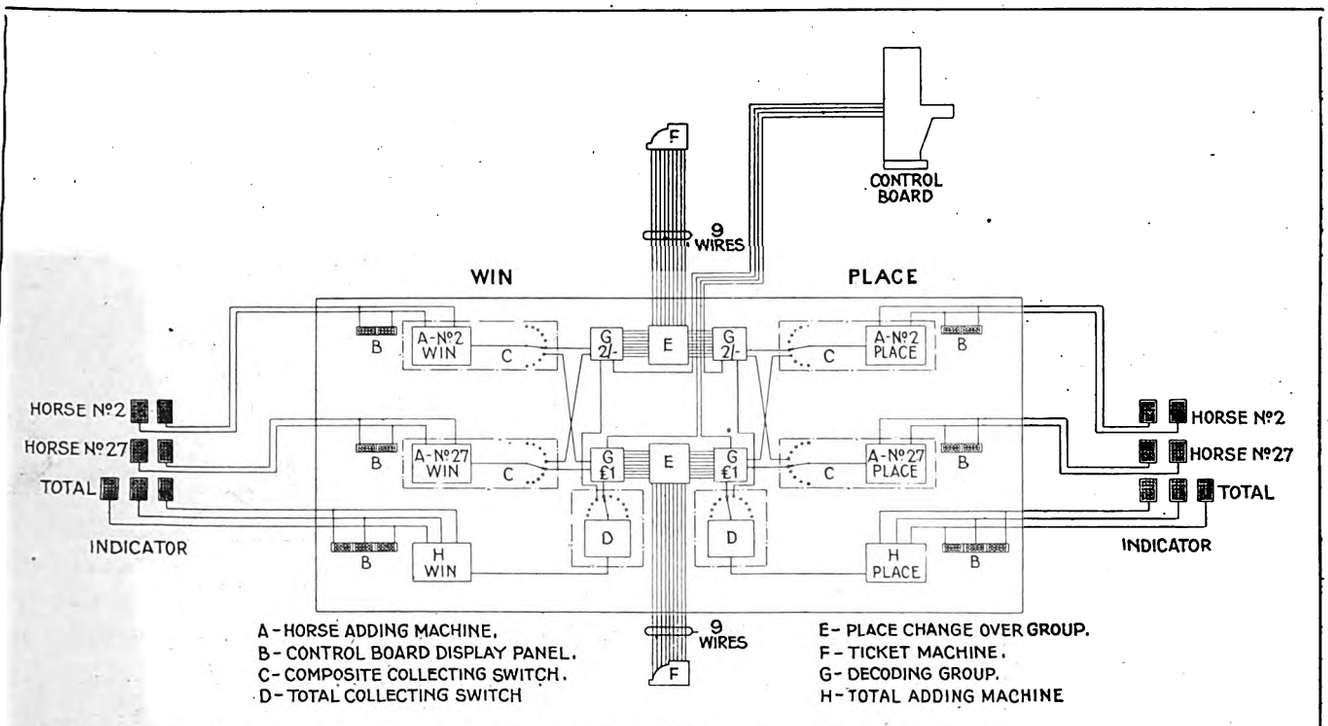

Fig. 2.—Illustrating the theoretical arrangement of the all-electric totalisator which has been adopted as standard by the Racecourse Betting Control Board.

Digitized by Google

depression of the stake key the group releases the bet for registration on the adding machines.

Interposed between the decoding relay group and each adding machine are the collecting switches. These comprise Strowger heavy duty rotary line switches, and their function is to successively collect the bet signals from the various ticket issuing machines. Whilst betting is in progress these switches are in continuous rotation at a speed of about 50 r.p.m., the brushes traversing 2 400 contacts per minute. This high speed provides an ample margin for coping with the busiest pre-race period when hundreds of ticket issuing machines may be in use simultaneously. In these circumstances the total adding machines would also be in continuous operation, the totals changing as rapidly as forty to fifty times per second.

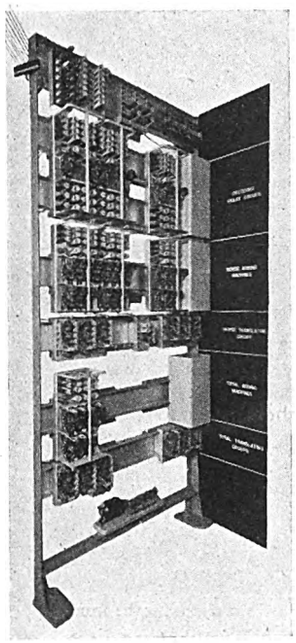

Fig. 3.—Illustrating the "Strowger" electro-mechanism and method of mounting, the covers being removed from all except three of the detachable units.

Strowger heavy duty rotary line switches in association with relays comprise the adding machines, of which there is one for each horse "win" and each horse "place," together with two total adding machines, "win" and "place" respectively. The adding machines are interchangeable, and their name implies their function — viz., that of aggregating the bets received from the collecting switches and transmitting the resultant totals to the indicator for visual display. The maximum capacity of each adding machine is 2 400 bets per minute, of each denomination, or a total of 12 000 bets per minute. In the unlikely event of this capacity being exceeded, the machine automatically controls ticket issuing, which is held up until the adding machine has overtaken its arrears and is again in a condition to register bets.

The whole of the Strowger switch and relay groups above described, constitute the main equipment of the R.B.C.B. standard totalisator and are mounted on single-sided racks, at a convenient central point, as shown in Fig. 3. The individual groups are all arranged to "jack-in" on horizontal pressed steel shelves of channel section, the arrangement being such that any group can be immediately detached or replaced without disturbing the permanent wiring or interfering with the general progress of betting. This method of mounting and wiring the equipment coincides with that recently developed for the Post Office by the Automatic Telephone Manufacturing Co., Ltd. Each group has an individual dust-proof metal cover, whilst slip-on covers also protect the wiring, tags, etc. The flexibility assured by the universal "jack-in" principle is another important advantage, and, in the case of the R.B.C.B. standard totalisator, enables all equipment to be removed and stored except when required for a race meeting, leaving only the racks and permanent wiring in situ. Furthermore, the arrangement makes for extreme mobility and facilitates common use of the Strowger equipment at various racecourses where the dates of the fixtures do not coincide. The "jack-in" principle applies similarly to the ticket issuing machines, as well as to the component sections of the indicator.

The Indicator Board.

The indicator of the R.B.C.B. standard totalisator is on the lamp monogram principle, each unit or numeral comprising a bank of 24 lamps, the lighting of selected groups of which form luminous figures in accordance with the signals transmitted by the adding machines. The front of the demonstration indicator at Thirsk illustrating the effect when totals are displayed is shown in Fig. 1. It will be seen that there are six banks of lamps or monograms in line with the number of each horse and seven for the respective totals, "win" and "place." Every lamp is light-insulated from its neighbour, housed in a blackened background and surmounted by a blackened grille, the result of this arrangement being that the illuminated figures are clearly visible in direct sunlight from a distance of over 150 yards to the public on the course, and from any angle up to 30 deg. Associated with each figure is the mechanism for controlling the grouping of the lamps for lighting in accordance with the received signals, both the mechanism group and the bank of lamps being on the "jack-in" principle and interchangeable. Individual monograms and their associated control units can be removed during the progress of betting without affecting the totals, which will indicate correctly and in accordance with the amended figures immediately the indicator units are replaced in circuit.

If necessary the R.B.C.B. indicator can be arranged as at Thirsk to display simultaneously on both sides, and any number of subsidiary indicators can be worked in parallel with the main indicator without additional equipment, or regard to their location.

Main Control.

The central control board, Fig. 4, is the key to the entire installation and enables the fullest possible control over the betting, including all ticket issuing machines and the horses running in each race to be exercised by one individual if necessary. It is equipped with a number of keys, and corresponding signal lamps, one key representing each horse and each total adding machine, "win" and "place" respectively. Betting is started by manipulation of the corresponding keys at the control board. Thus, if both "win" and "place" betting are permitted, the total "win" and total "place" keys are operated followed by the various horse "win" and "place" keys representing the actual runners. If there is no "place" betting these keys are left normal, and it is impossible for the ticket issuing machines to accept "place" bets. Restoration of the horse and total keys to normal immediately stops all betting inasmuch as the issue of tickets is controlled from the adding machines, and a horse adding machine cannot continue in service unless the corresponding total adding machine is also working. The signal lamp associated with each key glows as long as the key is in the operated position and enables the controller to see at a glance what portion of the equipment is working and registering bets. Furthermore a miniature replica of the main indicator, seen to the left of the control board, reproduces the horse and total figures simultaneously with their display on the main indicator, thereby keeping the controller informed of the state of the betting at any moment. By means of a master key the end of the betting period which coincides with the start of the race may be controlled by the starter or other official from the starting post, remote from the control board. Manipulation of this key stops the issue of tickets at all machines on the course, and simultaneously the signal lamps at the control board are extinguished. The general arrangement of the circuits is indicated in Fig. 2.

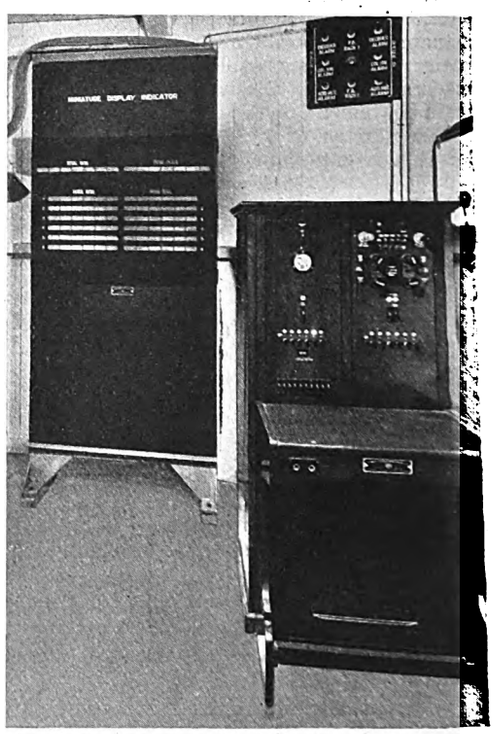

Fig. 4.—The central control board and miniature indicator as installed at Thirsk.

The equipment claims to represent a marked economy over other systems in cabling between machines and the central equipment as well as reducing the possibility of breakdown due to cable faults. Furthermore, due to simplicity of the circuits and the absence of any need for electrical synchronisation of switches, the utmost accuracy is claimed.

HIGH POWER MERCURY ARC RECTIFIERS.

Great Technical Progress Achieved.

MR. J. C. Read, M.Sc., A.M.I.E.E., of the British Thomson-Houston Co., read a paper before the Rugby Engineering Society on Wednesday on "High Power Mercury Arc Rectifiers." He said that the striking technical progress of the last few years had changed the high power rectifier from a rather unsatisfactory device to one which would without doubt find a useful place in high voltage d.c. railway electrification work. Arc backs had become sufficiently rare for satisfactory commercial service to be regularly obtained. There had also been a most striking development in the rating that could be obtained from a given size of rectifier and the limits of current and voltage obtainable in a single unit were now well above anything at present likely to be required.

For ordinary power and lighting service at 500 V and below the rectifier was only commercially justifiable in very rare cases and not at all at lower voltages. Possibilities in the direction of developing rectifiers of lower arc drop of the hot cathode type might ultimately extend the field to lower voltages. For traction at 600 V the rectifier had higher cost, larger floor space and 1½% to 2% lower efficiency than rotating machinery and was only justifiable in special cases. At 1 500 V the rectifier compared with two 750 V rotaries in series was about equal in cost, or slightly lower, required less floor space and had 1½% to 2% better efficiency. Owing to its lower power factor and impossibility of regeneration the two classes of apparatus would probably exist side by side at this voltage. At 3 000 V and above the rectifier would probably displace rotating machinery almost entirely as soon as a little more experience had been gained with it. It had heavy advantages in cost, efficiency and floor space sufficient to offset the loss of the ability to use regenerative braking. At this voltage the rectifier might even go far to settle the rivalry between the d.c. and a.c. systems of railway electrification in favour of the former.

The Berlin suburban railways were completely electrified at 800 V, principally with rectifiers, of which 119 of various makes were in use. On the Czechoslovakian railways a 1 500 V 4 270 kW rectifier was in use. The Consolidated Mining and Smelting Co. were installing a 650 V 6 500 kW rectifier and the entire supply for the Delaware, Lackawanna and Western Railroad would be given by 18 rectifiers of 3 000 V, totalling 37 000 kW.

Mr. Read then discussed a variety of principles, his paper being illustrated by a number of instructive diagrams and graphs.

ELECTRIC POWER ON STEAMSHIPS.

Reduction of Fuel Costs.

IN the Ellerman Line steamer "City of Hongkong," which has now returned from India, there is in use a device invented by Mr. James Scott, electrical engineer, of Liverpool, which, it is claimed, enables fuel costs to be reduced by at least 25 %, while more power and increased speed are secured.

This equipment, which is said to increase greatly the efficiency of the reciprocating steam engine, consists of a specially designed steam turbine, driven by the exhaust steam after it leaves the low pressure cylinder of the main reciprocating engine, and directly coupled to an electric generator, the energy from which drives an electric motor, which, in turn, is directly coupled to the propeller-shafting.

The designers believe that further economies are possible by the introduction of pulverised fuel, which, with the improvement effected by the equipment described, should help towards bringing coal into its own again as a competitor with oil as fuel for ships.

INSULATORS AND FOGS.

The British Porcelain Co. inform us that they have been manufacturing insulators designed to meet fog trouble of very similar pattern to that illustrated on page 133 of our last issue since 1926. They add that insulators of this type were supplied by them to the Sydsvenska Kraft A.B., Malmoe, Sweden, while Professor Velandis was consulting engineer to that company. There is a difference between the fog insulators designed by the British Porcelain Co. and Bullers, Ltd., in regard to the shape and arrangement of the corrugations under the sheds.

H.T. DISTRIBUTION.

Transformer Losses.

AT the informal meeting of the Institution of Electrical Engineers, held on January 26th, the subject of discussion was "High Tension Distribution" with Mr. W. A. Ritchie in the chair. The discussion was opened by Mr. G. V. Twiss, who exhibited several lantern slides illustrating instances and examples, drawn mainly from distribution systems under his supervision in various parts of England and Wales.

Mr. Twiss first remarked that as the result of centralisation of generation a complementary state of decentralisation was manifest in the greater use of electrical transmission. He preferred to describe as transmission lines those extra high-voltage services whose function is to supply lower voltage systems which are not tapped for supply at first hand.

An interesting technical note was in regard to transformer losses in a small section described, 15 transformers having a total capacity of 1 300 kVA. The iron losses of these transformers constituted a 24-hour load and necessitated the supply of about 60 000 units per annum.

In assessing the copper losses of these transformers it should be noted that the load factor of the losses was smaller than the load factor of the system. Assuming a value of, say, 12% for the loss load factor, the copper losses would be about 20 000 units per annum. The total transformer losses therefore amounted to approximately 80 000 units per annum.

Mr. Twiss said that h.t. distribution was closely concerned with the electrification of rural and small urban areas, the main requirement being economy consistent with reliability. Coincident with such economy of capital expenditure it was necessary that there should be a very high degree of efficiency in selling methods in order to secure the fullest use by the rural communities of the supply provided.

On the discussion being thrown open, a number of questions were put to Mr. Twiss, to which he subsequently replied, keeping a large meeting closely interested for long past the usual hour.

Mr. A. F. Harmer said he was glad to note that the same type of transformer was used for indoor and outdoor service. He asked why Mr. Twiss was erecting 33 kV lines which must shortly become obsolete.

Mr. E. Kilburn Scott asked what sort of demand was required to make a line practicable, and to this question he obtained the reply that if the annual revenue of a service was about one-fifth or one-quarter of the capital outlay the supply was an economic possibility.

In reply to Mr. W. E. Lang, who urged that the wiring contractor be given every encouragement, as he could best bring in consumers and develop an area, Mr. Twiss said he was in agreement, but in new areas the contractor was not often available and was reluctant to come. It had been found that collaboration was the most successful method.

Messrs. F. B. Allcock, H. D. Barlow, J. R. Bedford, J. H. C. Brooking, A. G. Hilling, G. H. Holding, S. B. Jackson, C. F. Moundson, R. S. Odd, N. Prentice, C. W. Prescott, J. F. Shipley, D. H. Stewart, and C. Wade also spoke.

INDUSTRIAL RESEARCH.

Report for Year Ended July 31st.

THE report of the Department of Scientific and Industrial Research for the year ended July 31st, 1929, which has just been issued, contains a review of the work done in fuel research, radio research, daylight and artificial illumination, and electrodeposition. Particulars are also given of the new grant scheme in support of the work of research associations, the report of the National Physical Laboratory and the Metallurgical Research Board, engineering research, and work done upon lead cable sheathing, the report of the Radio Research Board, dealing with the propagation of waves, directional wireless, direct reading direction finders, atmospherics and radio standards and precision measurements. A review is also given of the work of the research associations connected with the industries producing or handling cast iron, non-ferrous metals and scientific instruments, the electrical and allied industries, and numerous other trades. The report is published by H.M. Stationery Office, London, &c., price 3s. 6d. net.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Symmetrical Components.

[To the Editor.]

Sir,—I have read with interest the review of Dr. Gunther Oberdorfer's book, "Das Rechmen mit symmetrischen Komponenten," which appeared over the signature W. F. C. on p. 733 of your issue for December 13th, 1929. This review contains certain statements of a general character which seem to call for some comment.

It does not appear to be generally appreciated that the principle of symmetrical components was first published in France by L. G. Stokvis (see "Comptes Rendus," vol. 159, p. 46, 1914), the same writer contributing a paper on the subject in the "Electrical World," vol. 65, p. 1111, 1915. Fortescue's classic paper of 1918 contains, I believe, an independent recognition of the principle and applies it in the development of an operational calculus of a very general character, by means of which numerous important problems arising in the unbalanced operation of polyphase machinery are analysed. The independent development of the subject by Stokvis, Genkin and other French electricians, and by Fortescue and his associates in America has led many recent writers to refer to the principle of symmetrical component analysis as the "Stokvis–Fortescue principle," thereby giving credit to both initial investigators.

Your reviewer correctly states that the method has received but slight attention in Great Britain. I should like to point out that with the object of introducing the principle to British engineers I contributed in 1926 to the Selected Engineering Papers of the Institution of Civil Engineers an elementary monograph on the method of symmetrical co-ordinates in polyphase theory, see No. 40 of that series. No doubt this publication has escaped your reviewer's notice.

I am of the opinion that the writer of the review takes too limited a view of the utility of the method in practice, at the same time questioning its value as part of the equipment of an electrical engineering student. In regard to the first point I would respectfully point out that the use of the method is not confined to the analysis of short-circuit phenomena or other instances of unbalanced loading which, as the writer justly points out, are often unstable and "very nebulous"; indeed, by far the greatest use of the method is in the investigation of problems quite other than short-circuit conditions or other states of momentary unbalance. For example, in America at the present time the method is the fundamental basis of calculations of the stability of large interlinked power systems and a voluminous literature on this problem alone is already in existence. Moreover, the use of symmetrical co-ordinates is the most satisfactory way of treating the theory of sensitivity and stability of protective devices. Again, there are numerous problems in the theory of unbalanced circuits, e.g., the supply of single-phase power from three-phase networks, which are steady-state conditions and which can be most lucidly and concisely analysed by means of symmetrical components. There are numerous additional instances which could be cited in which clarity and analytical simplicity are obtained by the use of the Stokvis–Fortescue principle, but limitation of space precludes their discussion in a brief letter.

As regards the second point, its utility to the student, I can state from my experience as a teacher of electric circuit theory that no other way of discussing unbalanced systems succeeds in giving the student such a clear picture of the physical conditions existing in transient or steady operation of such systems, especially as regards the flow of energy. I am unable to see that there can be any artificiality in analysing such complex phenomena as occur in unbalanced systems in terms of those elementary properties of balanced systems with which students are already familiar.—I am, etc.,

Technical Abbreviations.

[To the Editor.]

Sir,—Your correspondent, "H. H.," does not like the abbreviation kWh, and calls upon us to change our standards. What does he mean by "*our* standards"? This abbreviation may not be entirely logical, but it has the merit of being internationally agreed, and until a change is agreed internationally the confusion caused by a change on the part of British engineers would undoubtedly be a strange recompense for our moral satisfaction in being logical. "H. H." suggests that the Germans should use a capital H for the noun "hour," but does he not remember that the symbol H is already used in another sense, again internationally?—I am, etc.,

J. F. Stanley.

Thornton Heath,
February 1st.

Insulating Oils.

[To the Editor.]

Sir,—Mr. E. B. Wedmore, Director of the British Electrical and Allied Industries Research Association, has brought to my attention the fact that in figure 4 of my article on Insulating Oils in your issue of November 29th, 1929, I have omitted to state that the electrodes used by Mr. J. E. T. Cogle in the experiments described were ½ in. diameter spheres spaced 2·54 m/m. (0·10 in.) apart, instead of the standard B.E.S.A. 4 m/m. (0·157 in.) spacing.—I am, etc.,

Allan Monkhouse.

BOOK REVIEWS.

Elements of Radio Communication. By John H. Morecroft. (London: Chapman and Hall.) Pp. x+269. 15s. net.

Students of radio requiring something more sound and thorough than the "popular" fare, but being insufficiently equipped to attempt such works as the author's "Principles of Radio Communication," should find this book helpful. It gives a general review of those parts of the alternating current theory which are of fundamental importance in radio, and follows on with specific applications of these principles to radio telegraphy and telephony.

While practically no mathematical knowledge more advanced than algebra is required for mastery of the text, the requirements of most radio students, apart from the engineers specialising in this branch of communication, are reasonably well met in this volume. Much of the specific treatment is directed to broadcasting, and reasonable amplifications, power factors, losses, and so on, are given for apparatus designed for the broadcasting frequencies. The final chapter deals with all kinds of receiving sets, from a simple crystal circuit to the most modern a.c. operated receiver. Attention is also directed to balanced circuits, push-pull amplifiers, different types of loud speakers, the selectivity and fidelity of amplifiers, filters, etc.

G. W. D.

Telegraphy and Telephony. By E. Mallett. (London: Chapman and Hall.) Pp. ix+413. 21s. net.

While many books have been written on various aspects of electrical communication, there is apparently no single work containing an outline exposition of the application of scientific principles to the art of electrical communication, which serves as an introduction to the specialised books, and yet does not deal largely with the teaching of electricity and magnetism, which is better done elsewhere. It is this apparently well defined gap in the literature of the subject that the author has attempted to fill.

The book is therefore designed to meet the needs of a university or technical college student who has studied electricity and magnetism up to a second year standard, and of those junior engineers who find themselves engaged in "light" electrical engineering without having had any instruction in the subject at college. From the examinations point of view it may prove a suitable text book in the telegraphy and telephony papers in the final examinations for the B.Sc. (Eng.) of the University of London, in the higher grade technological examinations of the City and Guilds Institute, in the I.E.E. entrance examination, and in the Civil Service Commission's examinations. The book is well and clearly illustrated by a series of very competent line drawings and diagrams.

NEWS IN BRIEF.

Faraday Old Students' Dance—L.C.C. School of Engineering—Rural Supplies in Argentina—Appointments Vacant—Hull Telephone Licence.

THE Traffic Workers' Brotherhood, which includes tramway and bus men, held a church parade last Sunday at St. Mark's Church, Kennington, London.

Great Britain and Northern Ireland have 1 850 000 telephones, and New York City is only slightly behind with a total of 1 790 370. In New York, however, there are about 783 000 domestic or residence telephones, against 404 700 in Great Britain and Northern Ireland.

The Faraday House Old Students' Association and Faraday House Rugby Club have arranged to hold a supper dance on February 26th at the Hotel Russell, W.C.1. Early application for tickets should be made to the Hon. Secretary, Faraday House O.S.A., Southampton Row, London, W.C.1.

An electric traction engineer is wanted for service in the Bombay, Baroda and Central India Railway.

The Senate of the University of London invites applications for the chair of physics tenable at the East London College.

The Postmaster-General has renewed the licence for Hull Corporation's telephone undertaking for a further 30 years.

Barking U.D.C. is to obtain from neighbouring authorities particulars of conditions and cost of installing electric cookers.

The Metropolitan Asylums Board is to provide electric pumps for the sewage works at Leavesden Hospital, at a cost of £265.

St. Pancras (London) Electricity Committee recommends that the B.C. approve the principle of permitting lamp standards to be used for advertising purposes.

Employees of Glasgow Corporation transport department, including 45 men and four women, have been presented with medals in recognition of their having completed 35 years' service.

Dr. M. Luckiesh recently described, at a meeting of the American Institute of Electrical Engineers, a device known as the "sunlight lamp," which is said to be in course of being perfected by the General Electric Co. of New York and which Dr. Luckiesh predicts will reduce colds, nervous troubles and other ailments and extend the life of man by many years.

A course of five short lectures by Mr. E. T. Painton on "High Tension Transmission and Distribution of Electrical Energy" is being held on Tuesday evenings from 7 to 9 p.m., commencing on February 4th, at the London County Council School of Engineering and Navigation, High Street, Poplar, E. 12. Further particulars from the Secretary, at the School.

The Compañia Anglo Argentina de Electricidad has decided to invest considerable capital in an extensive application of electric power in the agricultural regions of the Argentine. High-tension cables will cover wide areas of the country. The raising of the necessary capital, it is stated, offers no difficulty in Europe, where unlimited confidence is felt in the future of the Republic.

Mr. Ben Turner, Secretary for Mines, expressed, to a deputation of Members of Parliament last week, the view that electrical firedamp detectors in their practical application to the daily work of mines were still in a stage of experiment and development, and that he would not yet be justified in requiring, or recommending, their general or extensive use. He promised to consider suggestions with a view to the further development of such detectors.

The annual general meeting of the Institute of Metals will take place on March 12th and 13th, at the Institution of Mechanical Engineers, London. The annual dinner and dance will be held on March 12th. Amongst the papers to be read at the annual meeting will be one by Messrs. L. Davies and L. Wright on "Protective Value of Some Electro-Deposited Coatings." Further details can be obtained from the secretary and editor, Mr. G. Shaw Scott, 36, Victoria Street, Westminster, S.W.1.

Mr. C. H. Luke, of "The Times" Trade and Engineering Supplement, addressing the London Chamber of Commerce last week, said Canadian imports during the year ended May 31st, 1929, were valued at £263 000 000, of which Great Britain sent about £39 000 000 and the U.S.A. £180 000 000. A grievance of the Canadian people was that executive men of British firms did not visit Canada often enough.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of February 7th, 1880, recorded that the price of the Edison Light Company's $100 shares had declined from $3 500 to $1 500 a share, owing to delays and adverse rumours, based apparently on the difficulty which was being experienced in maintaining a perfect vacuum in the lamp bulbs.*

Electric light (Jablochkoff candles) had just been exhibited before the Shah of Persia at Teheran by M. F. Boital.

* * *

TWENTY-FIVE years ago, it was recorded in THE ELECTRICIAN *of February 3rd, 1905, that there were 17 miles of tube railways, 7 miles of ordinary tunnel railways and 84 miles of electrically-driven surface railways in operation.*

The reply of the Postmaster-General to the deputation which had protested against the disfigurement of the country by telegraph poles had given rise to some correspondence in the daily Press. It was remarked in THE ELECTRICIAN *that "by showing a proper spirit of compromise such matters may frequently be settled, although we despair of its being possible to extend our telephone trunk lines adequately without sometimes offending the delicate susceptibilities of the Commons and Footpaths Preservation Society and others."*

An engineer in charge is required in the Hammersmith (London) electricity department.

Chester Corporation is ininviting tenders for the provision of six call boxes in various parts of the city.

Increases of pay to workmen in the engineering department of the Post Office will cost £200 000 for the first year.

Mr. George Lansbury, M.P., opened last Saturday new baths and washhouses at Bow, in which nine electrically-heated washing machines are installed.

On the Wimbledon-Hampton Court route of the London United Tramways experiments are being made with a signalling device on tramcars, to indicate when cars are about to stop.

The annual dinner of the Iron and Steel Institute will take place at the Connaught Rooms, London, on May 1st, and the annual meeting at the Institution of Civil Engineers, London, on May 1st and 2nd. Any further details can be obtained from the Secretary, 28, Victoria Street, London, S.W.1.

The trustees of Sir James Caird's Travelling Scholarships will award one senior scholarship value £250 to £600, and two junior scholarships value £50 to £150, for the ensuing year in electricity and electrical engineering. Only natives of Scotland are eligible. Forms of application and further particulars from the secretary, Mr. John Pearson, 7, Ward Street, Dundee, until March 31st.

A report by the Sub-Committee of the Science Standing Committee of the Royal Institute of British Architects on the smoke nuisance states that at least 50% of the smoke nuisance is contributed by domestic chimneys. Electricity is recommended as the best means of reducing sulphur in the atmosphere to a minimum, if its cost can be brought within the range of the ordinary householder.

Executives of the engineering trade unions met in London last week to hear reports from the various districts with regard to the failure of the unions to induce the engineering and allied employers to concede a claim of 8s. for timeworkers, and a proportionate advance to pieceworkers. It was decided to appoint a sub-committee to meet the employers again and discuss the whole situation in the light of the reports.

The International Paper and Power Co., Boston, Mass., is offering to employees of the company and affiliated companies cumulative 7% preferred stock at $80 a share. As the result of four previous offerings, commencing in 1925, employees have subscribed for 36 939 shares. Employees may pay for stock in full or by instalments spread over 1½ years. A bonus is paid to stockholding employees each year. Under the present offer bonuses increasing from $1 to $5 a year will be paid during the first five years.

PERSONAL.

ALD. Samuels (Hammersmith B.C.) has been reappointed chairman of the District Joint Board of Employers and Members of Staff, Electricity Supply Industry, Area No. 10 (Greater London).

Mr. Laurence J. Kettle, city electrical engineer, Dublin, who has retired.

Mr. William Chamberlain has been elected a director of the International Paper and Power Co.

Stepney (London) Electricity Supply Committee has appointed Coun. Lewis chairman and Coun. Groves vice- chairman for the ensuing year, and recommends that they, with the town clerk, Mr. Wm. McCarty, shall represent the Council on the Conference of Local Authorities owning Electricity Undertakings in Greater London. It is also recommended that Coun. Lewis shall represent the Council on the British Electrical Allied Research Association.

Mr. A. H. Darker, consulting engineer of J. Stone and Co., Ltd., Deptford, London, is leaving England by the "Orontes" on February 15th for a world tour.

Mr. A. T. Bullen, now mains engineer to Bedford Corporation, has been appointed to the post of electrical engineer to the Welwyn Garden City supply undertaking.

Estate of the gross value of £10 566, with net personalty £9 505, was left by the late Mr. Gilbert Wakefield Carpenter, assistant manager of Scarborough electricity undertaking.

Plymouth Tramways and Transport Committee has received and accepted the resignation of Mr. J. W. Eunson, and resolved to advertise for a rolling stock superintendent at a commencing salary of £400 per annum.

Burnley Transport Committee has further reduced the short list of applicants for the post of manager to Mr. Frank H. Crossley (Ashton-under-Lyne), Mr. H. P. Sharpe (Rotherham) and Mr. Charles H. Stafford (Reading).

Marylebone (London) Electric Supply Committee recommends that Ald. G. B. Brooks be nominated to represent the Council as an associate member of the British Electrical and Allied Industries Research Association for the ensuing year.

Mr. E. Stopford Saunders has been appointed chief engineer and manager of the Surbiton electricity supply undertaking. He succeeds Mr. T. M. Colson, who tendered his resignation owing to ill-health, but whose services are being retained in an advisory capacity.

Mr. Alfred George Collis, chief of the switchgear section of Crompton Parkinson, Ltd., has been elected to fill a casual vacancy on the Essex County Council for the Brentwood division. Mr. Collis is a member of the Brentwood Urban Council, and a director of the Brentwood Electric Light Co., and the Brentwood Electrical Installation Co.

Hammersmith B.C. Electricity Committee proposes, in dealing with the vacancy which will arise at the electricity works upon the resignation of Mr. J. F. Sarvent, station superintendent, the promotion of Mr. A. T. Gordon-Smith (senior engineer-in-charge) to a new position of electrical superintendent (salary, £466 19s. 10d.); the promotion of Mr. G. A. Tottman, repairs engineer, to a new position of mechanical superintendent (salary, £466 19s. 10d.); and the promotion of Mr. A. C. Tedstone, engineer-in-charge, to senior engineer-in-charge (salary, £394 8s. 4d.); and to invite applications for the vacant position of engineer-in-charge (salary, £359 2s. 9d.). The General Purposes Committee reports its approval of the proposals, but, having regard to the new positions and designations suggested, is of opinion that particulars thereof should be submitted to the District Joint Board, and its approval is subject to this stipulation.

Obituary.

Mr. HENRY HOLGATE, on January 21st, aged 66 years. He was born at Milton, Ontario, and in 1894, in the service of the Royal Electric Co., built and operated the Montreal Park and Island Railway. Four years later he became manager of an electrical company in Jamaica, and built and operated the hydro-electric tramway system in Kingston. Returning to Montreal, he joined Mr. R. A. Ross, and the firm constructed a number of hydro-electric plants. The partnership was dissolved in 1911, when he became president of the Cedar Rapids Power Co., and afterwards consulting engineer.

BUSINESS ITEMS.

THE HART ACCUMULATOR CO., LTD., Stratford, London, E.15, received a visit recently from a party of students of the Insurance Institute of London, whose curriculum includes the inspection of factories of various kinds.

Included in recent orders received by the BRITISH THOMSON-HOUSTON CO., LTD., Rugby, for electrical plant destined for duty overseas, is one from the High Commissioner for India (consulting engineers, Messrs. Preece, Cardew and Rider) for four large water wheel driven alternator sets to be used in the Shanan Power Station in connection with the Uhl River hydro-electric scheme. Each alternator will be driven by a Boving water wheel and will have an output of 12 000 kW (16 000 H.P.), the rating being 13 333 kVA, 0·9 power factor, 11 000 V, three-phase, 50 cycles, 428 r.p.m. Each set will be provided with direct-coupled exciters arranged for automatic voltage regulation. For the supply of electric power to the mines of North Broken Hill, Ltd., Broken Hill, South, Ltd., and the Zinc Corporation, Ltd., Australia, a particularly notable central power station is projected, and it is interesting to record that orders have been received by the B.T.H. Co., on behalf of Messrs. Australian Ore and Metal Pty., Ltd., for the six 2 500 kVA (2 700 H.P.) alternators and the whole of the switchgear. Messrs. Robert Bruce and Sons are acting as inspecting engineers for this equipment, which is the largest where Diesel engines are used as prime movers ever installed in the world at one time. The six alternators are each rated 2 500 kVA, 0·8 power factor, 6 900/7 200 V, three-phase, 40 cycles, with neutral earthed, and will run at 160 r.p.m. They are of the protected type and the stators and rotors are split on the horizontal diameter.

Included in the B.T.H. switchgear is a control board with h.t. cubicles mounted beneath the switchboard gallery, the oil circuit breakers contained in these cubicles being remote electrically operated. In addition there is a l.t. switchboard. The total number of the panels is 36 without allowing for the automatic Tirrill voltage regulator panels, which brings the total to 45, while the high tension remote control cubicles number 18. In addition to the foregoing, the B.T.H. Co. has received orders for outdoor type transformers required in connection with the electrification scheme. Of these transformers, seven are three-phase units each of 750 kVA, 6 900/575 V, 40 cycles rating, and eleven are single-phase units of 833 kVA rating.

ELECTRICAL WOMEN.

Formation of Branch at Bradford—Details of Future Meetings.

A Bradford Branch of the Electrical Association for Women was formed last week, the inaugural meeting being held in the Mechanic's Institute, Bridge Street, on January 30th. Lady Watson, who accepted the Presidency, was in the chair, and Miss Haslett, the director, was supported in her address by Ald. Kathleen Chambers (Vice President of the Bradford Branch), Mr. Thos. Roles, city electrical engineer, Mr. Harry Moss (E.C.A. Council) and Ald. J. W. Longley, chairman of the Electricity Committee. The President of the Association, Mrs. Wilfrid Ashley, was unable to be present, but sent a message expressing her regret, and wishing the branch every success. Mrs. A. W. Brown, wife of Capt. Brown, E.D.A. Area Officer, was elected hon. treasurer, and Miss Eva Moss, who had been working for two months preparing for the formation of the Branch, was elected hon. secretary.

Miss Eva Moss, hon. sec. of the Bradford Branch of the E.A.W.

Meetings of the Bradford Branch will be held at the offices of the Corporation electricity department and the first lecture has been fixed for February 13th, when Mr. Harry Moss will speak on "Some Things you Should Know about Your Electrical Installation." The second lecture will be given by Mr. Geo. S. Francis, of London, on "Modern Tendencies in Architecture, Furnishing and Lighting Design, and the part Electricity plays Therein," and the date of this has been arranged for March 13th.

ELECTRICAL DISTRIBUTION.

Interesting Paper Read Before the Manchester Engineers' Association.

THE electrical distribution system of Manchester was the subject of a paper given by Mr. H. C. Lamb, chief engineer and manager of the Manchester electricity department, before the Manchester Association of Engineers on January 24th. Briefly, the lecturer used the experiences of the Manchester power system to illustrate the developments of electrical supply generally. Mr. Lamb said that the public supply of electricity was commenced in Manchester in the year 1893 by direct current only to supply an area of approximately one square mile, which had now grown to 52 square miles. He referred to the acute controversy which had taken place between the advocates of the direct and the alternating current systems, some forty or forty-five years ago. Unfortunately, the views of the champions of direct current had mostly prevailed in this country. This was particularly so in the industrial towns, where the future importance of the power load was recognised, alternating current being adopted in towns where the demand was expected to be chiefly for lighting. The development of the polyphase motor made alternating current equally as suitable as direct current for motive power. The advantage of a standard system of current and a common voltage for all small consumers was obvious, but before standardising, one had to be tolerably certain regarding the best voltage and system for general use. For many years the economies of the alternating current system as compared with direct current had been apparent, and included lower capital cost in sub-stations, higher efficiency in operating them, and cheaper plant for the consumer. It was not until 1925 that there was any recognised standard, and, generally speaking, those undertakings operating at voltages of 230 240, and 250 for lighting had come latest into the field.

Twenty-one Years Ago.

The earliest low tension alternating current areas on the Manchester supply system were Audenshaw, Droylsden and Failsworth, where networks were laid down in 1908. Since then the numerous new housing areas had all been laid out for alternating current and many small districts had been detached from the direct-system: the street mains, together with consumers' installations being converted to alternating current at the standard voltage of 230. Approximately 9 000 consumers had been changed over, and were supplied at the standard voltage. No decision had yet been reached to change over the whole of the dense area in the heart of the city. To relieve the low tension mains, and also to obviate further expenditure on converting plant, it was the present policy not only to connect all large new buildings to high tension mains, but also to detach, in some cases, warehouses and blocks of offices with demands exceeding 50 kilowatts, from the low tension and connect them direct to high tension mains. Referring to overhead distribution which was usually employed in rural areas with the object of reducing costs, Mr. Lamb said that in a few cases experiments had been made with overhead systems in towns. There were two examples in Manchester, the Blakely and Gorton Mount Housing Estates, which were among the earliest to be laid out by the Corporation in the post-war period. The overhead lines were constructed in 1921 at a time when prices were at their highest, and a considerable capital sum was saved. The principle drawback to the use of overhead wires in towns was the increased cost of maintenance as compared with underground mains, chiefly due to oxidation of the constructional work, and another disadvantage of the overhead construction in towns was the length of service lines. Referring to the national "grid" he said that, as a result of legislation, it looked as though the principle of inter-connection would be carried further in Great Britain than perhaps in any other country.

THE BIRMINGHAM ELECTRIC CLUB.

There was a large attendance of members of the Birmingham Electric Club at the opening meeting of the second half session on Friday, January 24th. The occasion gained in interest from the fact that tangible recognition was made of the services rendered to the Club during the past fifteen years by Mr. R. A. Chattock, the retiring electrical engineer of the city. Mr. Chattock was presented with a cocktail set, which he acknowledged in a short speech of thanks.

INDUSTRIAL DESIGNS.

Many Prizes Offered by Electrical Firms in R.S.A. Competition.

PARTICULARS of the seventh annual open competition of Industrial Designs to be held at the Imperial Institute South Kensington, London, S.W., in June next, have now been issued, and can be obtained from the Secretary of the Royal Society of Arts, John Street, Adelphi, London, W.C.2. Intending competitors must apply to the Secretary of the Society between May 1st and May 10th for the necessary entry forms, the last day for receiving entries being May 26th. The designs will be received at the Imperial College of Science and Technology, Imperial Institute Road, S.W., between June 11th and 13th. In all scholarships and prizes amounting to nearly £1 900 are offered in connection with the 1930 Competition.

Electrical Prizes.

Hailwood and Ackroyd, Ltd., of Morley, near Leeds, offer a prize of ten guineas for a design of an electrical illuminating fitting intended to occupy the central position in a room, of which the dimensions are 25 ft. by 15 ft. by 10 ft. 6 in., and a wall bracket fitting to match, designed in modern style. Designs should be original, and the selection of materials is optional to the designer. Full-size drawings are required. The winning design shall become the property of the donor of the prize.

Blackpool Corporation Publicity Committee offers a prize of £25 for a design for a 16-sheet double crown poster (120 in. by 80 in. upright), required to advertise Blackpool during the autumn season, when the chief attraction is the scheme of illuminations covering three miles of promenade during the period September 20th to October 20th. Designs should be drawn to a double crown size (30 in. by 20 in.) upright, and should be bright and original in character with a fitting slogan. The Publicity Committee will pay an additional £10 10s. for any designs subsequently reproduced as posters. (Competitors desiring a copy of the illustrated Guide to Blackpool can receive it, post free, from Mr. W. Foster, Director of Publicity, Town Hall, Blackpool.)

The Council of the British Electrical Development Association, of 15, Savoy Street, W.C.2, offers a prize of £25 for the design of a poster advertising uses of electricity in rural districts. A pamphlet dealing with such uses will be sent to any competitor on application, in writing. The design to be suitable for reproduction as a double crown poster (30 in. by 20 in.), and reproducible by lithographic, photographic offset, or selectacine process in not more than five colours.

Celestion, Ltd., of London Road, Kingston-on-Thames, offer a prize of £30 for a design for a double crown poster 30 in. high by 20 in. wide advertising the company's loudspeakers. The subject of the poster is to be symbolical of "The Very Soul of Music," and not more than seven colours are to be used. Intending competitors should apply to the Advertising Department, Celestion, Ltd., for a descriptive pamphlet entitled "Music—its Creation and Re-Creation."

E. K. Cole, Ltd., of Ecko Works, Leigh-on-Sea, Essex, offer a prize of £25 for a design for a double crown poster (30 in. high by 20 in. wide), in not more than seven colours to advertise their "Ecko" all-electric wireless sets or "Ecko" all-power supply units. The slogans used to typify the selling points are: "Plug in—that's all"; "Worryless Wireless"; "No batteries—no accumulators"; "Ecko-Lectrify your set." Intending competitors should apply to the Advertising Department of E. K. Cole, Ltd. for a descriptive booklet, and are advised to study pages 3-5, 16-19 and 24-25.

W. T. Henley's Telegraph Works Co., Ltd., of 11, Holborn Viaduct, London, E.C.1, offer a prize of £25 for a design for a showcard 15 in. by 10 in., suitable for display on the premises of electrical contractors, to advertise to the public the Henley Wiring System. Alternatively a design for a cut-out showcard could be submitted. The design should be capable of being produced by lithography, using not more than six colours. It should be attention arresting, and not overburdened with too much wording. A simple design should be aimed at. Descriptive literature will be supplied to intending competitors on application to the Advertising Department, W. T. Henley's Telegraph Works Co., Ltd.

The next luncheon of the Engineering Section of the I.S.B.A. will be held at the Hotel Cecil, London, on February 14th, when the speaker will be Mr. E. E. Sharp, and the subject "Lessons from a Business Tour in Australia and New Zealand."

ELECTRICAL ADVERTISING.

Manchester E.D.A. Sales Conference—Electrical Opportunities.

SALES possibilities of electricity in advertising formed the subject of an interesting lecture given by Mr. H. Lingard at the E.D.A. Manchester Bureau on January 22nd, it being the third of the present series. Mr. H. A. Prior took the chair. In opening, Mr. Lingard said that luminous advertising provided great scope for the electrical salesman, but he emphasised the necessity of introducing novel effects, upon which the success of electrical publicity to a large extent depended. The supply authorities could help matters considerably by offering attractive tariffs. The lecturer first dealt with flood-lighting in its relation to advertising. He pointed out that firms owning large and attractive buildings possessed an advertising asset in the architectural features thereof. This was greatly enhanced by the use of judicious flood-lighting, which extended the period of usefulness to the hours of darkness. It was important, however, to vary the scheme of lighting from time to time by using different colours. It should also be done on a grand scale. Another important form of advertising which could be effectively illuminated at night was that of poster hoardings. Mr. Lingard upheld that people were more likely to look at posters and electrical signs during the evenings, when their minds were unoccupied, than during the day. The slides which were shown in connection with this were certainly very striking, and indicated a field of development with great possibilities. Compared with other countries we were behindhand in the use of electricity in advertising. The lecturer next turned to the indoor electric sign which he said was the least developed of all. This type, which embraced all luminous indicator signs, could be very suitably exploited in hotels and public buildings, and the electrical salesman should find a large market in this direction. The illumination of shop faciers, which in Germany was almost standard, was overlooked here, and if taken up would greatly benefit the electrical trade. In summing up, Mr. Lingard mentioned various possible outlets for the trade in the shape of illuminated house numbers and street names, etc. The local authorities were in some cases responsible, but it was the duty of the industry to encourage the exploitation of electrical sign devices as much as possible. In the ensuing discussion Mr. R. C. Hawkins mentioned one or two interesting examples of electrical publicity and endorsed Mr. Lingard's statement that the railwayside was a field which should be developed. A number of further useful ideas were submitted by speakers and some technical details referred to in the paper were fully explained. In reply to a remark by Mr. Romero, of the Salford Electricity Department, Mr. Farthing, of the G.E.C., said the reason why lamps were cheaper in America was that they used a standard voltage. They had reduced the price as low as it was possible, and a small cut at the present time would be a serious thing. As soon as the authorities would introduce a standard voltage, say 230, then the manufacturers would be in a position to sell at a cheaper rate.

ELECTRICITY METERS.

Important Addition to B.E.S.A. Specification Regarding Terminal Connections.

ALTHOUGH a revision of the British Standard Specification for Electricity Meters was issued so recently as April, 1929, a further revision has now been published by the B.E.S.A. The new edition, however, differs from the 1929 edition only in the addition of a clause relating to the standard terminal-connections, and a series of diagrams illustrating these connections. These terminal-connections are a mandatory feature of the specification, and, therefore, constitute a very important addition which is of interest to both manufacturers and users of meters. The specified limits of error, which were appreciably reduced by the 1929 edition, remain unchanged, and it is of interest to note in this connection that meters having an accuracy within the limits laid down by the specification would be classed as Grade I if the proposals recently made by the International Electrotechnical Commission become effective, the majority of continental meters, with larger tolerances on accuracy, being classed as Grade II.

Copies of this specification may be obtained, price 2s. 2d. post free, from the Publications Department, British Engineering Standards Association, 28, Victoria Street, S.W.1.

LEGAL INTELLIGENCE.

Judgment Given in the Case of Oxford Electricity Co.

ON January 29th, Mr. Justice Bennett, in the Chancery Division, delivered his reserved judgment in the case of the Corporation of Oxford against the Oxford Electricity Co., Ltd., with respect to the acquisition by the Corporation of the company's undertaking and works. His lordship said two questions had arisen between the parties, which he was called upon to decide, first, what was the proper method of ascertaining the price the plaintiffs had to pay to the defendants for the purchase of part of the defendants' undertaking; and the second, what was the date from which the plaintiffs were entitled to the profits and that part of the undertaking which they were purchasing? By virtue of the Oxford Electric Lighting Order, 1890, the local authority might, by notice in writing, require the undertakers to sell their undertaking, and on December 3rd, 1928, plaintiffs served on the defendants such a notice requiring them to sell at a price to be ascertained, in accordance with the terms of the order. The parties being unable to agree how the price was to be ascertained, the plaintiffs issued a writ asking the court to declare the true meaning of the section of the order and for a decree of specific performance. The difference between the parties was this: The plaintiffs said the purchase price to be paid by them was to be ascertained by capitalising a sum of five per cent. upon the capital of the defendants, shown by their books to have been properly expended on the undertaking, upon the footing that that sum represented the annual net profits of the defendants' undertaking. The defendants said that the purchase price to be paid to them was to be ascertained by capitalising the annual net profits of their undertaking upon a five per cent. basis. In other words, what was to be done was to ascertain what the annual net profits of the undertaking were, and then to ascertain what was the capital sum, which, if invested at five per cent., would produce those profits, and they said that sum was the sum which plaintiffs were to pay. Between these two contentions said his lordship, his judgment was in favour of the plaintiffs. There was no reason why the local authority should be interested in the capital of the defendants unless it were as possible purchasers of their undertaking, and only then if the capital was to be a factor in the calculation by which the purchase price was to be ascertained. As to the date from which plaintiffs were entitled to the profits of the undertaking, plaintiffs claimed that the date was December 3rd, 1928. on which they served the notice on defendants. The defendants counterclaimed for a declaration that the profits would not belong to the plaintiffs until completion of the transfer of the undertaking and payment of the purchase price. The obligation of the defendants to sell the undertaking arose when plaintiffs gave them notice requiring them to sell, and it was an obligation to sell the undertaking as it existed at the date of the notice, subject to all subsisting rights and contracts. It followed that from the same date plaintiffs must be entitled to the profits of the undertaking and they must be entitled to the benefit of the contracts, the burdens of which were imposed upon them. The order he would make in the action would embody appropriate declaration. Defendants must pay the costs of the action and the counterclaim would be dismissed with costs. There would be liberty to apply as to the loose plant, stores, etc., of the defendants not in the area affected by the purchase.

Mr. Tyldesley Jones, K.C., for plaintiffs, said when the matter again came before the court, on the form of the declaration to be granted, he might propose that the questions to be settled should go before a special referee.

Mr. Henderson Craig. K.C., for defendants, said he might at the same time desire to ask for a stay of execution.

Electric Furnace Sale.

In the Official Referees' Court of the High Courts on January 29th, Sir William Hansell, K.C., one of the Referees, had before him an action brought by the Electric Furnace Co., Ltd., of 17, Victoria Street, S.W., to recover £489 3s. 9d., balance of the price of goods sold and delivered from Kelloyd metals, of the Palace of Industry, Wembley. Defendant denied liability and counterclaimed for £150 and for damages.

Mr. John W. Morris (instructed by Churchill, Clapham and Co.) appeared for plaintiffs, and Mr. Claud Mullins (instructed by Sidney Smith and Son) for defendants.

Sir Wm. Hansell gave judgment for the plaintiffs on both claim and counterclaim.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

INVERNESS DISTRICT BOARD OF CONTROL, February 7th.—Rewiring of electrical installation at Inverness District Asylum, Specification from Mr. C. A. Grut, Electricity Offices, Waterloo Place, Inverness; deposit £2.

SHEFFIELD CORPORATION, February 7th.—Electric wiring and fittings; Earldom Road Council School. Specifications, etc., from the City Architect, ; deposit £1.

BASINGSTOKE CORPORATION, February 8th.—Supply and erection of two heavy oil engines, each coupled to 800 kW three-phase 50 cycle alternator; one set to be ready by September 15th, 1930, and the other by September 15th, 1931. Tenders may be for either set or both sets. Specifications, etc., from Mr. F. Swarbrick, borough electrical engineer, Electricity Works, Brook Street, Basingstoke; deposit £1 1s.

DARWEN EDUCATION COMMITTEE, February 8th.—Electric light installation in Avondale School. Specifications from the Borough Engineer.

SALFORD CORPORATION, February 8th.—Low tension, paper insulated, lead covered and armoured cable. Form of tender from the City Electrical Engineer, Electricity Department, Frederick Road, Salford.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 10th.—Six or 12 months' supply of electric lamps, lanterns, etc. Specifications, etc., from Mr. A. E. Darby, borough engineer, Town Hall, Cambridge Road, London, E.2.

KETTERING URBAN DISTRICT COUNCIL, February 10th.—Supply of high and low tension cables. Specifications, etc., from Mr. W. A. Walker, Electricity Works, Rockingham Road, Kettering; deposit £1 1s.

LONDON MIDLAND AND SCOTTISH RAILWAY, NORTHERN COUNTIES COMMITTEE (IRELAND), February 10th.—Twelve months' supply of telegraph ironwork, wire, electric lamps and porous pots. Tender form (No. 26) from Mr. F. J. Martin, stores superintendent, York Road Station, Belfast, on prepayment of 6d.

NORTHERN IRELAND GOVERNMENT, February 10th.—Electric light installation at Lurgan R.U.C. Barracks. Specifications can be seen at the Barracks and at the Ministry of Finance, 15, Donegall Square West, Belfast.

PORTSMOUTH CORPORATION, February 10th.—Twelve months' supplies to the tramways department, including insulating materials, lamps and motor windings (section Q); overhead line materials (section R), etc. Specification and form of tender from Mr. B. Hall, general manager and engineer, Tramways Department, Guildhall, Portsmouth.

RUGBY RURAL DISTRICT COUNCIL, February 10th.—Electric lighting installations in connection with housing schemes: Wolston, 26 houses; Brandon, 12; London Road, Dunchurch, 16; Newton, 8; and Churchover, 12. Plans, etc., from the surveyor, Mr. J. E. Weeks, Temple Street, Rugby.

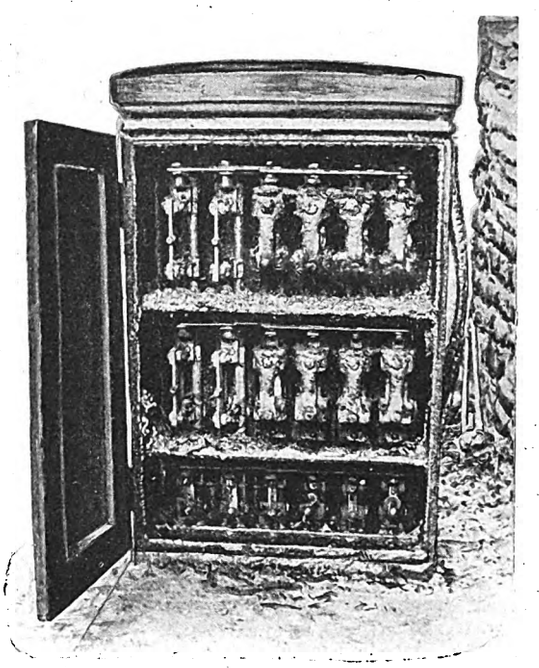
BELFAST CORPORATION, February 11th.—Supply of tramway stores for 12 months, including electrical accessories, cable insulation, carbon brushes, copper rail bonds, trolley heads, guard and span wire, overhead suspension fittings, controller fingers, commutators, coils, etc. Forms of tender from the General Manager, Tramways Department, Sandy Row, Belfast.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, February 11th.—Twelve months' supply of cables for street mains and services (tender form E.S.1); lamps (E.S.2), meters (E.S.3), creosoted cable protection boards (E.S.4); plywood meter boards and insulators (E.S.5); ironclad service cutouts (E.S.6); street lighting standards and electric fittings (E.S.7); and creosoted wood service tee boxes (E.S.8). Forms of tender from the Electrical Engineer, 37, High Street, Cheadle, Cheshire.

STOKE-ON-TRENT CORPORATION, February 12th.—Twelve months' supply of mains and cables (contract No. 3 002) and static transformers (contract No. 3 003). Specifications and forms of tender from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2 for each.

STOKE-ON-TRENT CORPORATION, February 12th.—Supply of an electric mail van (contract No. 3 001). Specifications, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

TORQUAY CORPORATION, February 15th.—Two water tube boilers, economisers, etc., for the electricity works. Specifications, etc., from the Borough Electrical Engineer and Manager; deposit £3 3s.



ONE of the few bright spots of the widespread floods in South Wales was the performance put up by the electrical distribution system. The "Henley" unit pillar shown above was for a time completely submerged but continued to function satisfactorily. Subsequently the supply was disconnected as a precautionary measure and on account of the damage done to the catenary cable lines across the river. This pillar was submerged again a week later and the silt and mud deposited on the porcelain fuse handles are clearly visible in the illustration.

BLACKPOOL CORPORATION, February 17th.—Supply of electrical sundries, etc. Forms of tender and specifications from the Borough Treasurer, Town Hall, Blackpool. Stamped addressed envelope to be sent.

EDMONTON GUARDIANS, February 17th.—Six months, supply of electric lamps, X-ray, light and massage requisites, etc. Forms of tender, etc., from the clerk, Mr. E. Ridley, Board Room, 77, Bridport Road, Edmonton, London, N.18. Stamped addressed envelope to be sent.

HARROGATE CORPORATION, February 17th.—Twelve months' supply of electric lamps, lamp columns, etc. Forms of tender, etc., from the Borough Engineer.

HULL CORPORATION, February 17th.—Twelve months' supply of stores to the tramways department, including controller and motor parts, carbon brushes, trolley gear, cable, lamps and fittings, copper wire, insulating tapes, commutators, overhead line fittings, etc. Forms of tender, etc., from the General Manager, Tramway Offices, Albion Street, Hull.

PLYMOUTH CORPORATION, February 17th–20th.—Supply of electricity meters, paper insulated cables and transformers. Specifications, etc., from the City Electrical Engineer, Electricity Offices, Armada Street, Plymouth, until February 17th. Tenders by February 20th.

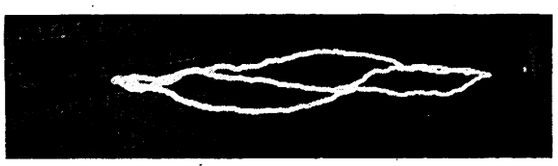
WIMBLEDON CORPORATION, February 17th.—One 7 500 kW, two-phase turbo-alternator, condensing plant and auxiliaries.

Digitized by Google

Specification, etc., from Mr. A. E. McKenzie, Electricity Works, Durnsford Road, Wimbledon, London, S.W.19; deposit £2 2s.

HOLBORN (LONDON) BOROUGH COUNCIL, February 18th.—Twelve months' supply of electric lamps, etc. Specification, etc., from the Borough Engineer, Town Hall, High Holborn, London, W.C.1.

STOCKPORT CORPORATION, February 18th.—One 60-ton electric crane and gantry. Specification, etc., from Mr. R. Lee, borough electrical engineer.



AN untouched photograph of three strokes from an artificial lightning generator of 1 100 000 V produced at the high voltage laboratory at the Hollinwood works of Ferranti, Ltd.

METROPOLITAN ASYLUMS BOARD, February 19th.—Electric light installation at Woolwich Casual Ward (contract No. 3); electric light installation at Lambeth Casual Ward (No. 4), conversion of workshop power units to electricity at Darenth Training College (No. 5); and installation of wireless receiving apparatus at Northern Hospital, Winchmore Hill (No. 6). Specifications from the Board's Offices, Victoria Embankment, London, E.C.4; deposit £1 for each.

HULL CORPORATION, February 20th.—One 1 000 000 gallons per hour, natural draught cooling tower (contract 152); cast iron circulating water pipes (contract 153); and two motor-driven, vertical spindle drainage pumps. Specifications from Mr. J. N. Waite, city electrical engineer, Electricity Works, Sculcoates Lane, Hull; deposit £2 for each.

CENTRAL ELECTRICITY BOARD, February 22nd.—Transformer oil-treating plant for 18 transformer stations in the area of the Central England Scheme. Specification (No. B.E.—P.S. 2), etc., from Mr. R. E. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CROYDON CORPORATION, February 26th.—Six months' supply of electrical fittings and appliances, etc. Specification, etc., from the Union Offices, Mayday Road, Thornton Heath. Stamped, addressed envelope to be sent.

OXFORD CORPORATION, March 1st.—Manufacture and erection of engines and pumps, including two oil-driven auxiliary engines each driving an electric generator; electric light installation, etc. Specification, until noon on March 1st, from Sir A. Binnie, Son and Deacon, Artillery House, Artillery Row, Westminster, S.W.1; deposit £10.

CENTRAL ELECTRICITY BOARD, March 3rd.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme. Specification (No. S.E.E.—P.F. 5) from the secretary and solicitor, Mr. R. H. Fox, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, March 19th.—Coal-handling plant at Ironbridge generating station. Specification (No. 8), etc., from Mr. E. F. Hetherington, Phœnix Buildings, Dudley Road, Wolverhampton.

Overseas.

UNLESS otherwise stated particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., LTD., February 7th.—Supply of overhead electric travelling crane for car shed, in connection with Madras improvements. Specifications and forms of tender (5s.) from the Company's offices, 91, Petty France, Westminster, S.W.1.

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844).

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T. 151/2 025.) (Reference B.X. 5 955).

MEATH COUNTY COUNCIL, February 15th.—Electric lighting and heating installation in Trim Courthouse building. Specification, etc., can be seen at the County Surveyor's Office, County Hall, Navan.

GOTHENBURG HARBOUR AUTHORITY, March 3rd.—Supply of ten electrically operated 2½-ton portal cranes. (Reference A.X. 9 089.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 20th.—Supply of two 150 kVA motor alternator sets, for Durban workshops (tender No. 1 615.) (Reference B.X. 6 115.)

NEW ZEALAND POSTS AND TELEGRAPHS, March 31st.—Supply of spare parts for B.P.O. dial No. 10. (Reference B.X. 6 097.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled single-phase transformers. (Reference B.X. 6 095.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

Tenders Accepted.

DUMFRIES CORPORATION.—John Marshall, electrician's work for ensuing year.

ANGLO-PERSIAN OIL CO.—English Electric Co., Ltd., generating plant.

TAMWORTH CORPORATION.—G. R. Coles, electric light installations, £5 per house.

ABERDEEN CORPORATION.—W. Wilson and Co., one year's supply of electrical fittings.

ADMIRALTY.—Edison Swan Electric Co., Ltd., supply of pattern No. 4 590 accumulators.

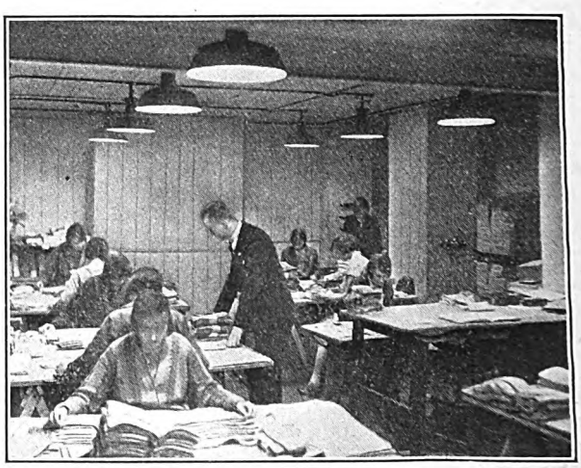
SOUTHEND CORPORATION.—Davey and Armitage 1 600 electricity meter boards, £156 13s. 4d.

CROYDON CORPORATION.—Ferguson, Pailin, Ltd., supply of works' auxiliary switchboard, £1 728 10s.

ADMIRALTY.—Edison Swan Electric Co., Ltd., supply of carbon filament lamps, patterns 1 760 and 915.

EDMONTON GUARDIANS.—Speedy and Eynon, electrical work in connection with nurses' home extension, £1 475.

CALNE CORPORATION.—Western Electric Supply Co., construction of overhead line for supplying North Street area, £312 10s.



A LONDON "soft goods" inspection room illuminated by "Geco" dispersive reflectors and Osram daylight blue lamps.

BERMONDSEY (LONDON) BOROUGH COUNCIL.—Crompton Parkinson, Ltd., additions and alterations to main switchboard, £30.

DUNDEE CORPORATION.—Stevenson and Co., electric lighting work in connection with reconstruction of Lilybank day nursery, £47.

JAMAICA PUBLIC SERVICE DEPARTMENT.—Brush Electrical Engineering Co., Ltd., 2 000 kW Brush-Ljungstrom turbo-generator set.

Digitized by Google

HUDDERSFIELD CORPORATION.—J. Marsden and Sons, electrician's work in 36 new houses on Lowerhouses estate, Almondbury.

SOUTH SHIELDS CORPORATION.—Tudor Accumulator Co., Ltd.; battery repairs and renewal of plates, £1 685. (Recommended.)

FULHAM (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., electric lighting of Council Chamber, £160 10s. (Recommended.)

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.—British Thomson-Houston Co., Ltd., 11 000 Mazda gasfilled vacuum and carbon lamps.

BRIGHTON CORPORATION.—Combustion Generator, Ltd., provision of oil firing equipment at Southwick power station, £1 000. (Recommended).

Electric Pumps for Waterworks.

HEMEL HEMPSTEAD CORPORATION.—Worthington-Simpson, Ltd., two electric pumps, including provision of two ammeters, for the waterworks, £511.

LONDON COUNTY COUNCIL.—Leonard G. Tate and Co., Ltd., electric wiring and fitting at Kender Street School, Deptford, £347 10s. (Recommended.)

LEATHERHEAD URBAN DISTRICT COUNCIL.—Leatherhead and District Electricity Co., public lighting for 5½ years, with 205 lamps, £975 per annum.

STOKE-ON-TRENT CORPORATION.—Wadsworth and Son, Ltd., £144, conversion of electric lift at Hanley Town Hall from d.c. to three-phase, £144.

HAMPTON URBAN DISTRICT COUNCIL.—Twickenham and Teddington Electric Supply Co., Ltd., external lighting at sewage disposal works, £36 15s.

CONSOLIDATED MINING AND SMELTING CO. (CANADA), LTD.—International Electrolytic Plant Co., electrolytic hydrogen plant, £50 000 (approximate).

HACKNEY (LONDON) BOROUGH COUNCIL.—Ferguson, Pailin, Ltd., supply of switchgear, £44 096, inclusive of provisional sum of £2 000. (Recommended.)

FIFE EDUCATION COMMITTEE.—J. and C. Lamont, electric light installation in connection with reconstruction of Broad Street School, Cowdenbeath, £277.

GUILDFORD GUARDIANS.—A. E. Dean and Co., X-ray apparatus, £335 15s., and accessories, £32 12s. 9d., including loan of rotary convertor for one year.

NEWPORT PAGNELL RURAL DISTRICT COUNCIL.—Northampton Electric Light Co., electricity installations in houses at Hanslope, £2 16s. per house.

MAIDENHEAD CORPORATION.—Hackbridge Electric Construction Co., Ltd., 50 kVA transformer, £67; Crompton Parkinson, Ltd., 150 kVA transformer, £107.

STEPNEY (LONDON) GUARDIANS.—F. W. Smurthwaite, £1 311, and Smith and Hammond, Ltd., £600, works in connection with wireless installations at hospitals.

HASLINGTON PARISH COUNCIL.—Electricity Distribution of North Wales and District, Ltd., public lighting, with 45 lamps, £3 4s. per lamp for season (1 070 hours.)

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Ferguson, Pailin, Ltd., supply of switchgear, £44 096, and busbar connecting chambers, £2 000. (Recommended).

SOWERBY URBAN DISTRICT COUNCIL.—G. A. Cotton, electrical work in connection with repairs and renovations at Wadsworth Old Town Council Schoolhouse, £28.

STEPNEY (LONDON) BOROUGH COUNCIL.—J. Warner, Ltd., supply of 50 c.i. boxes, frames and covers, £80. (Recommended.) Also tendered: E. and F. Wright, £81.

SEAHAM HARBOUR URBAN DISTRICT COUNCIL.—General Electric Co., Ltd., Siemens Electric Lamps and Supplies, Ltd., and Metro-Vick Supplies, supply of lamps, 1s. 2d. each.

LONDON COUNTY COUNCIL.—Marryat and Scott, Ltd., electric goods lift at Stamford Hill Stores, £864. Also tendered: Pickerings, Ltd., £880; Express Lift Co., Ltd., £888.

SOUTHWARK (LONDON) BOROUGH COUNCIL.—Alton Battery Co., Ltd., battery plates, £166 5s.; R. Hornby and Co., Ltd., slot meters, £69 12s.; Gould's Foundries, Ltd., pistol links, £87 10s.

HASTINGS CORPORATION.—English Electric Co., Ltd., supply of switchgear, £11 395. Barber and Colman, Ltd., provision of electric traffic signals, £1 387. (Both recommended.)

NEWBURY CORPORATION.—Ralph E. Smart and Co., installation of electric motors, starting gear, centrifugal pumps and ancillary works, at sewage pumping station, £816 5s. 6d. (Recommended.)

EALING CORPORATION.—Mead and Jeffery, Ltd., electric wiring of houses on North and South Roads, £1 182 1s. 6d.; W. G. Hutt, electric wiring of council houses on Northolt housing estate, £370.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—General Electric Co., Ltd., works in connection with street lighting, £1 848; Enfield Cable Works, Ltd., supply of cables, £732. (Both recommended.)

SOUTHEND CORPORATION.—Greenwood and Batley, Ltd., two 15-cwt. Greenbat trucks (type J.2), £358; two trailers, £50; one generator, £68, charging panel, £57, and spare battery, £48, in connection with pier tramway.

WEST HAM GUARDIANS.—Relay Automatic Telephone Co., installation of internal telephones at Children's Homes, £233. Other tenders: Siemens-Schuckert (Great Britain), Ltd., £133, and Shipton Automatic Telephone Co., £142 10s.

METROPOLITAN ASYLUMS BOARD.—L. G. Tate and Co., Ltd., electric lighting at Caterham Mental Hospital, £184 10s.; Solus Electrical Co., Ltd., supply of X-ray couch and stand at Tooting Bec hospital, £209 10s. (Both recommended.)

METROPOLITAN ASYLUMS BOARD.—Alpha Manufacturing and Electrical Co., Ltd., electric light alterations at South-Western Hospital, £130 10s.; Hart Accumulator Co., Ltd., replacing storage battery at St. Luke's Hospital, £258 6s.

HORNSEY CORPORATION.—Reason Manufacturing Co., Ltd., Ferranti, Ltd., and Chamberlain and Hookham, Ltd., 12 months' supply of meters; Venner Time Switches, Ltd., 12 months' supply of time switches. (Both recommended.)

LONDON COUNTY COUNCIL.—Supply of insulating materials for 12 months: L. Andrew and Co. (£410), Hammett and Andrew (£320), Macinlop, Ltd. (£76), Mica Manufacturing Co., Ltd., Mica and Micanite Supplies, Ltd., the Pomona Rubber Co. (£393), Rubber Industries, Ltd., Rykneld Mills Co. and A. A. Sample.

GENERAL POST OFFICE.—Additional loading, London-Derby cable, Standard Telephones and Cables, Ltd. Telephone Exchange equipment: Lewis Berger and Sons, Ltd., Relay Automatic Telephone Co., Ltd.; Silverthorn (Chingford), Automatic Telephone Manufacturing Co., Ltd.; Perth, General Electric Co., Ltd.

GLASGOW.—Supply of motors in connection with change of frequency: One, £355, Electric Construction Co., Ltd., two, £52 14s., L. D. and M. Co., Ltd.; 79, £2 929 2s. 7d., British Electric Co., Ltd.; seven, £119 2s., G. H. Haden; nine, £1 007, Express Lift Co.; six, £44 2s. 1d., Brook Motors; one, £131 10s., Medway Lift Co.

GENERAL POST OFFICE.—Electric lighting: Birmingham (Midland) Automatic Telephone Exchange, Reynolds and Bradwell. Telephone Exchange equipment: Bristol Central, Bristol North (Bristol multi-area), Easton, Whitchurch, Stoke Bishop, Kingswood, Westbury, Bedminster, Bristol South, and Bristol West ditto, Automatic Telephone Manufacturing Co., Ltd.; Bradbury, Agnew and Co., London, Relay Automatic Telephone Co., Ltd. Telephone repeater equipment: Bristol, General Electric Co., Ltd.

GLASGOW CORPORATION.—British Thomson-Houston Co., Ltd., 2 000 Mazda traction lamps for the tramways department; Electric Construction Co., Ltd., 15 motors (new), £1 743, and three motors (reconstructed), £375; Etchells, Congdon and Muir, two motors (exchanged), £121; Waygood-Otis, Ltd., 24 motors (exchanged), £127; A. P. Chaplin, 15 motors (new), £1 429; English Electric Co., Ltd., 79 motors (new), £2 929; Jas. Keith and Blackman, Ltd., 20 fan motors (exchanged), £121; British Thomson-Houston Co., Ltd., four motors (new), £289; Crompton Parkinson, Ltd., 14 motors (new), £636; Mather and Platt, Ltd., two motors (new), £108.

BRITISH PLANT FOR URUGUAY.

The Metropolitan-Vickers Electrical Co., Ltd., has recently secured an order for the complete machinery and plant for the new Montevideo State super power station. The order comprises two 25 000 kW, 3 000 r.p.m. turbo-generator sets, each with direct coupled exciter and 750 kW auxiliary alternator, central flow condensing plant, with motor driven circulating and extraction pumps, and full capacity air ejectors, a 750 kW, geared turbo-alternator, water-tube boiler equipment, pipe work and valves, 26 K6A and 62 K3 electrically operated circuit breakers, control equipment of double fronted desk type; auxiliary service switchboard, 7 400 kW of three phase station auxiliary transformers, accumulators and charging equipment, cable work and automatic telephone equipment. The contract amounts to nearly three quarters of a million pounds.

ELECTRICITY SUPPLY.

Southend Extensions—Blackburn and Unemployment—Proposed Plant Extensions at Torquay—The Central Scotland Scheme—Important Developments in British Columbia—Dover and the Central Board.

BEDFORD Electricity Committee recommends extension of mains at the estimated cost of £1 383 10s.

Easebourne (Sussex) P.C. has decided to adopt electricity for public lighting, and has accepted the quotation of the Midhurst Electricity Co. for the erection, maintenance, etc., of 13 150 c.p. lamps.

Taunton Electricity Committee has decided to place the work in connection with its assisted wiring scheme only in the hands of registered contractors or members of the Electrical Contractors' Association.

Southend T.C. has been informed by the Electricity Commissioners that its application for sanction for a loan of £66 000 for the purchase and installation of three 1 200 kW land Diesel sets has been refused.

Blackburn Electricity Committee has requested the Electrical Engineer to report on the question of applying to the Government for a grant in aid of schemes for laying of mains, etc., to relieve unemployment.

240 000 V Cable.

A new electric cable, described as the largest in Italy, has just been brought into service. It is about 150 miles in length and carries current from the Cardano (Bolzano) station to the important industrial centres of Lombardy and Piedmont at a pressure of 240 000 V. The cable was laid in 10 months.

The Medway Board of Guardians has decided to use electricity in the institution and hospital at Chatham. It is proposed to obtain energy from the Kent Electric Power Co., the terms being for the first 3 000 kWh per quarter, 5d. per kWh and for the next 3 000, 4d. per kWh unit; and 2d. per kWh for power.

Torquay Electricity Committee seeks sanction to borrow £28 050 for 7 500 kW turbo-alternator; £40 700 for two 50 000 lb. boilers; £1 320 for two boiler feed pumps; £4 814 for switchgear and cables; £2 090 for circulating water pipes and valves; £2 006 for feed and surge tanks and piping, and £19 800 for extensions to buildings.

Inverurie (Aberdeenshire) T.C. has decided to apply to the L. and N.E. Railway Co. for a supply of electricity for the burgh from the locomotive works. In the event of the company being unable to supply the whole burgh, it is to be asked to consider the possibility of providing electric light for the new town hall and library buildings.

Whitby U.D.C. has adopted a scheme submitted by the electrical engineer, Mr. J. W. Piggott, for assisted wiring and the purchase and sale of fittings and appliances. The electricity department will undertake through local contractors the wiring of private premises to a maximum of six lighting points, and one iron plug, the department paying the contractor for the work.

Representatives of Edinburgh T.C. recently met Sir Andrew Duncan and Sir Archibald Page, of the Central Electricity Board, and Mr. M'Call, the representative in Scotland, to make preliminary arrangements for the joint opening of the extension of Portobello power station and the inauguration of the grid scheme for Central Scotland. It was arranged that the ceremony should take place early in May.

Brighton Electricity Committee has obtained sanction to borrow £50 000 for mains and services.—The Committee has voted £4 100 for the changing over of a portion of the network in the western area from 230 V to 460 V; for three new feeder panels for the sub-station in the western area and the changing over of the network in Little East Street.—The Committee has adopted a scheme for lighting Grand Junction Road and Madeira Drive at a cost of £1 275.

The Secretary for Scotland has been petitioned by the Scottish Central Electric Power Co., which supplies electricity in the counties of Linlithgow, Clackmannan, Stirling, and Dumbarton, for a Provisional Order authorising the company to increase its capital from £600 000 to £1 000 000. It is also proposed that the Electricity Commissioners shall have power to increase further the capital and borrowing powers, subject to confirmation by the Minister of Transport.

The regional town planning report of the Mid-Cheshire Committee, dealing, *inter alia*, with electricity, has just been published. The report states that the saving of the situation lies in the fact that it is only necessary to provide cables from the producing points, i.e., the Mersey Power Co., Runcorn, and the North Wales Power Co., Dolgarrog, and that the region may, by the aid of electricity, be able to retain its natural beauty, and still become industrial at appropriate points.

The British Columbia Electric Railway Co. has awarded to the Vancouver Engineering Works, Ltd., a contract for the construction of a steel penstock, nearly two miles in length, and costing $387 000, for use in connection with the enlargement of the hydro-electric power station from which the City of Victoria derives its supply of electricity. This pipe will have a diameter of 60 in., and will extend from the balancing reservoir to the Jordan River power house. Other contracts have been placed with an English company which will supply a 14 000 kW generator, costing $90 000, and an 18 000 H.P. water wheel, costing $70 000.

In a recent letter to Dover Electricity Committee, Mr. J. S. Highfield gave estimates for future cost of working the electricity undertaking (*a*) assuming the power station be developed so as to provide for a maximum load of 2 500 kW, and (*b*) assuming that local generation be stopped and the whole supply provided in bulk from the "grid" system, and pointed out that the Central Electricity Board had reduced the unit charge for a bulk supply from 2d. to 0·19d. The committee recommends that the whole supply be taken in bulk from the Board. The terms offered at £3 17s. 6d. per kW of maximum demand, plus 0·19d. per kWh, with a coal clause; the Board to pay £6 000 towards the cost of change of frequency.

Unemployment Grant.

In regard to the application by the Central Electricity Board to the Unemployment Grants Committee for a grant in aid of the proposed North East England Electricity Scheme, it is announced that the Committee has approved of a grant being made to meet for a time the burden of the expenditure involved in this scheme. Under the terms of this grant the whole of the interest charges will be met for a period of seven years, and half the interest charges thereafter, up to a total of 15 years from the date of expenditure. If, however, the development of electricity is sufficiently rapid for these charges to be borne partly or wholly by the industry without undue hardship at an earlier date, the State contribution will then be reduced or cease.

A further important extension of the transmission system of the Hammarforsen (Sweden) power station belonging to the Kreuger and Toll concern is announced. A new long distance 70 000 V transmission line will be added to the system. A new line, 136 km. long, will be built from Sundsvall southwards, *via* the town of Hudiksvall, to a point near Soederhamn, and from there to other lines as far south as the Vifors plant near the town of Gaevle—nearly 300 km. The combined power of the so-called Hammarforsen block, consisting of ten interconnected power plants, amounts to 60 000 H.P. The entire transmission system, when completed, will connect the large mills of the Kreuger and Toll wood and pulp combine and will enable it further to enlarge its capacity. The Kreuger and Toll wood pulp, timber and power concern, when finally linked together, will possess total reserves of water power of about 250 000 H.P.

The December production of electricity in the U.S.A. was 6% above that in December, 1928. Reports from representative companies throughout the country and covering the first two weeks in January, 1930, indicate that electric power production is running ahead of 1929, although recession in power demand by some industries is indicated. The use of electric welding in building construction in the U.S.A., instead of the nerve racking riveter, is becoming more and more popular. According to a recent announcement, the Southern California Edison Co. will erect a 13-storey structure which will be almost entirely electrically welded, and a 14-storey building to be erected by the Edison Electric Illuminating Co. of Boston will be the first electrically welded structure in that city. Another application of welding to the construction of city buildings will be made in Schenectady, N.Y., where a new $1 500 000 city hall is to be constructed by this method.

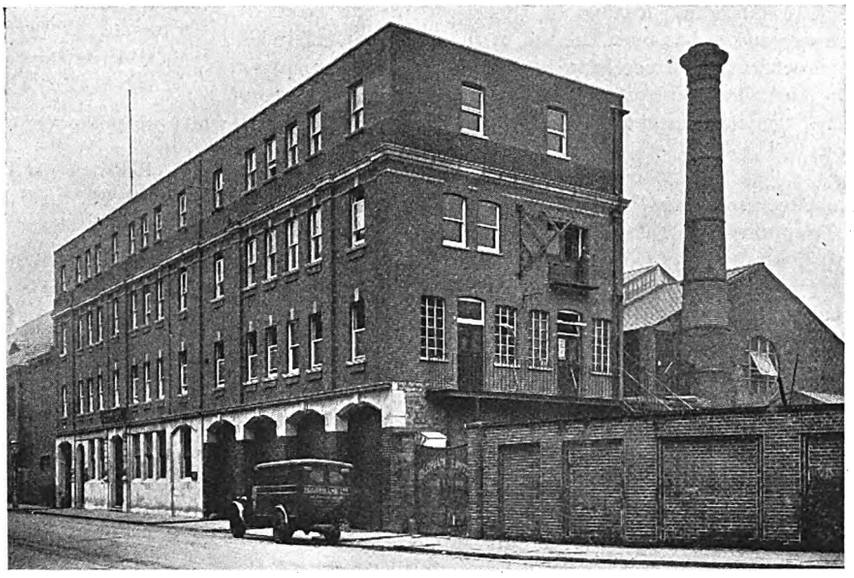
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. R. M. Longman, who is leaving the Yorkshire Power Co. to become chief assistant to Mr. S. E. Fedden, engineer, Mid-East England Area. As announced in our last issue, Mr. Longman was the recipient of a special presentation on January 27th, at a complimentary concert and dance given in his honour.



Everyone in the industry is glad to hear of the progress made by firms engaged in its various branches, and so rapidly is the science of illumination developing that Holophane, Ltd., have found it desirable to add another storey to their present building. The line between the original building and the new storey is clearly defined.

Members of the Plymouth branch of the Electrical Association for Women photographed on the occasicn of their recent visit to the power station, Prince Rock.

Delegates to the annual mid-winter meeting of the National Electric Light Association. In the centre of the photograph, left to right, are Mr. G. B. McCabe (Detroit), chairman of the Underground Systems, President Hoover, and Mr. H. W. Clark, chairman of the District of Columbia Committee.

COMPANY NEWS.

Slump in Cables and Wireless Stocks—The English Electric Reorganisation Scheme—Siemens and Halske's American Loan—Directors' Reports.

THE outstanding feature of the week in the electrical share market has been the fall in the Cables and Wireless Co.'s stocks. The cause is to be found in public recognition of the fact that the Post Office appears to be making use of foreign agencies instead of supporting Imperial Communications. The "A" stock has dropped 10 points, from 73½ to 63½; the "B" stk. 6 points, from 36½ to 30½; and the 5½% cumulative preference stock 2½ points, from 98½ to 96. American Telephone and Telegraph capital stock has been marked up 10 points, to 235. Radio Corporation of America shares are a point up, having risen to 39; Hydro-Electric Securities have receded from 44 to 43¼; and International Holdings are unchanged. International Telephone and Telegraph stock has weakened from $75 to $73.

Elsewhere there are few important movements to record. In the manufacturing section, the English Electric Co.'s shares have fallen from 5s. to 3s. 9d., on the scheme for reorganisation and reduction of capital; and Enfield Cable Works ordinary shares have weakened a further half-crown from £4 15s. to £4 12s. 6d. Associated Electrical Industries ordinary shares have also retrogressed slightly, having eased from 27s. 6d. to 26s. 6d.

Transportation shares have been quiet. Central London Railway ordinary stock is a point up at 72. Metropolitan District Railway ordinary stock at 74½ is ½ to the good, but Metropolitan Railway consolidated stock is 1 down at 64. Winnipeg Electric Co. Refunding Stock has improved from 84½ to 85½.

Among electricity supply shares, County of London have eased from 46s. 3d. to 45s. 7½d., but Metropolitans are 7½d. better at just over 38s. London Power 5% debenture stock at 99 has shed a point and Calcutta ordinary shares, at just under 47s., are 1s. 3d. down. Tokyo 1st Mortgage Bonds have hardened from 93 to 94. Adelaide Electric Supply Preference have advanced 6d. from 20s. 6d. to 21s.

Directors' Reports, etc.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Fin. div. of 13·12d. p. sh., making 1s. 9·12d. is announced.

YORKSHIRE ELECTRIC POWER CO.—Fin. div. of 5% on ord. shs., making 8% for year (same as last year) is announced.

CITY OF BUENOS AYRES TRAMWAYS (1904), LTD.—Fin. div. of 1/3 p. sh., makg. 5% for year; to amortisatn. and gen. fund £10 000. Fwd. £501.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—A syndicate, headed by Messrs. Morgan, offered $50 000 000 of the corporation's 25 year 5% deb. bonds at 96½ last Saturday.

ST. JAMES'S AND PALL MALL ELECTRIC LIGHT CO., LTD.—Blce. divs. of 8·4d. p. sh. on £1 pref. shs. (=3½%) and 9·949d. on ord. shs., makg. standard div. for year, have been declared.

DUBLIN UNITED TRAMWAYS CO., LTD.—The directors decided on Jan. 28 not to recommend a div. on the ord. stk. Usual div. on pref. shs. will be paid. Set aside for track renewals, £20 000. Fwd. £12 037.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO., LTD.—Int. on 4% mtge. deb. stk. for half-year endg. Jan. 31 will be paid by warrant on Feb. 1. The 4% mtge. deb. stk. register is closed until Jan. 31, inclusive.

YORKTOWN (CAMBERLEY) AND DISTRICT GAS AND ELECTRICITY CO.—Gross pft. for 1929, £15 661. After provisn. for int. and fin. div. on pref., fin. div. on ord. is at rate of 6¼% p.a., less tax, makg. 6¼% for year. Fwd. £10 429.

HALL TELEPHONE ACCESSORIES (1928), LTD.—Net pft. for 1929, £40 365, agst. £30 094. Fin. div. 6%, less tax, makg. 12% for year, agst. 10%, fwd. £4 719, agst. £4 632. Directors propose creatn. of further 150 000 10s. shs., makg. authorised cap. 500 000 10s. shs.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—A mtg. of the proprietors will be held on Feb. 14 to consider a resolution to create 200 000 new 6% cum. pref. shs. of £1 each.—The company has arranged to place, privately, £350 000 6% cum. pref. shs.

WESTERN UNION TELEGRAPH CO., INC.—Gross revs. for 1929 amtd. to $148 387 403, agst. $139 387 320 for 1928, total exes. were $129 286 765, agst. $120 310 256, and $3 610 065, agst. $3 609 405, is deducted for int. on bonded debt, leavg. net income $15 490 573, agst. $15 467 659.

METROPOLITAN RAILWAY CO.—Gross receipts for 1929 increased by £36 000. Fin. div. of 2¾% on ord. stk. proposed, makg. 4% for year, agst. 3½% for previous year. To res., £10 000; fwd., £32 016, agst. £23 888. Div. on surplus lands stk., 2⅜%, makg. 3⅜% for year. agst. 3¾%.

INTERNATIONAL MARINE RADIO CO.—The Marconi International Marine Communication Co., Ltd., states that no agreement of any kind has been arranged between it and the new International Marine Radio Co. which has been formed by the International Telegraph and Telephone Corporation.

ANDHRA VALLEY POWER SUPPLY CO., LTD.—Net pft. for year to June 30, 1929, Rs. 736 183, to wh. is added Rs. 100 082 brt. in. Set aside for depreciatn. on investmnts., Rs. 135 000; written off agst. loss on investmnts. sold, Rs. 7 777. Div. on pref. shs., 7% for year; div. on ord. shs. 2%, tax free. Fwd. Rs. 29 188.

AMERICAN COMMONWEALTH POWER CORPORATION.—Rev. for 1929, $25 593 046, agst. $17 871 714; net income, $11 322 693, agst. $7 056 828. After provision for funded debt charges and pfd. divs., blce. is $3 855 779, increase $2 579 631, equal to $2·29 p. sh. on combined class "A" and "B" stocks.

TRACTION AND GENERAL INVESTMENT TRUST.—Net rev. for 1929, £85 958, agst. £74 432, out of which int. divs. have bn. paid amtg. to £27 092. Transferred to res., £11 739, agst. £10 000. Final divs. of 2½% on pref. stk., and 11% on ord. stk., making 17% for year on the latter stk., agst. 16%. Fwd. £42 508, increase £6 710. Investmts., £2 145 099.

CIA CHILENA DE ELECTRICIDAD, LIMITADA.—The numbers are published of 40 series "A" £25 bonds, 80 series "B" £100 bonds, 44 series "C" £1 000 bonds and 6 series "D" £500 bonds wh. were drawn on Jan. 2 for redemption and will be repaid at nom. value on Feb. 28, w. int. for six months endg. on that date, at the Anglo-South American Bank, 117, Old Broad Street, London, E.C.2.

BRITISH COLUMBIA ELECTRIC RAILWAY CO., LTD.—The company has placed contracts totalling $500 000 (£100 000) for constn. of fourth generatg. unit of Jordan River plant on Vancouver Island. More than half the amt. will be spent in British Columbia, and the whole sum within the British Empire. In addition, it is estimated that about $200 000 (£40 000) will be spent in installg. the equipmt.

ALLGEMEINE ELEKTRICITATS-GESELLSCHAFT.—Rpt. for year ended Sept. 30th, 1929, shows gross pft. RM. 39 682 925, plus RM.515 195 brt. in. Taxes RM.12 113 744; written off buildings and machinery RM.5 911 668; discount on American loan RM.3 000 000; net pft. RM.19 172 708. After payment of 6% div. on pref shs., 5% on "B" pref. shs. and 9% on ord. shs., carry fwd. is RM.3 404 857.

LONDON POWER CO.—Output of stations in 1929 advanced by 23·46% to 733 238 288 kWh, and kW demand by 11·45% to 270 500. There was increase in proceeds from sale of currt. of £249 788, to £1 890 950, total income being £1 899 919, increase £252 951. Rev. blce. is £866 373, agst. £683 490, and in addtn. net interest receipts yielded £53 528, agst. £4 896. After provisn. for deb. int. and other charges, blce. is £3 000, which is applied in paying div. of 6% on sh. cap. held by the ten constituent companies.

NEW ENGLAND POWER ASSOCIATION.—This association, which is controlled by International Hydro-Electric System, a division of International Paper and Power Co., produced electricity during the year 1929 amtg. to 1 751 669 000 kWh, an increase of 27% over 1928. The associatn. has under constructn. a 200 000 H.P. hydro-electric developmt. on the upper Connecticut River at the Lower Fifteen Mile Falls site. This will be the second largest hydro-electric plant east of Niagara Falls and is expected to be in operatn. by Oct. 1, 1930. The associatn. will expend $20 000 000 for constructn. during this year.

SINGAPORE TRACTION CO., LTD.—Gross rev. for year to Sept. 30, 1929, £174 047, agst. £142 182. Net pft., £51 098, increase £13 839. Directors have appropriated £4 247 agst. £4 000, to deb. stk. redemptn., £3 000 to writg. off disct. and commissn. on same, and £15 000, agst. £10 000, to depreciatn. and renewals. It is proposed to pay div. of 7%, against 5%, on the 7% cum. pref. on acct. of arrears, leavg. arrears of 11%. This will require £14 000, and carries with it paymt. of similar sum to managers. Fwd. £3 357, agst. £2 539. At date of accounts, the 19 miles of route authorised for trolley bus operatn., under the tractn. ordinance, were completed and in use. Total length of trolley bus routes was increased to 22·31 miles by extensions constructed and equipped during year. As compared with precedg. year, number of vehicle miles run increased 26·9%, and passengers carried 19·4%. Vehicles in service consist of 108 trolley buses and 7 motor buses.

SIEMENS AND HALSKE'S AMERICAN LOAN.—The General Electric Co. of New York (which acquired a large interest in the Allgemeine Elektrizitäts-Gesellschaft, Berlin, in August last) is to take over a considerable part of a 1 000-year loan issued in America for Siemens and Halske Akt.-Ges. Messrs. Dillon Read and Co., of New York, on Tuesday invited subscriptions for the loan, which consists of participatg. debs. series "A" amounting to $14 000 000 (£2 800 000) nominal. The debs. are offered at 233%, and the actual amt. therefore will be $32 000 000 (£6 400 000). The debs. will carry int. at rate of currt. div, or not less than 6% on nom. value, and may be redeemed at nom. value any time after 75 years. They may be called in by company any time after 1942 at rate ruling on New York stock markets, provided this is not lower than issue rate. The German part of the loan will have a nom. value of M.10 000 000 (£500 000), and is to be offered to shhldrs. in proportn. of one deb. for every 10 shs. held, at 175%. The new cap. will therefore amt. altogether to nearly M.150 000 000 (£7 500 000). Messrs. Siemens and Halske have agreed to a large amt. of the loan being taken over by the General Electric Co. of New York. In the present case Siemens and Halske have not disposed of shs., and the General Electric obtains neither votg. rights nor a voice on the board.

ENGLISH ELECTRIC CO., LTD.—Particulars of a scheme to reduce cap. by about £1 755 000 and to provide £750 000 of new cap. were sent to shhldrs. on Monday. Losses disclosed in the blce. sheet for 1927 showed that new arrangements would have to be made. The substantial economies which had been effected have not enabled the company to earn the whole of the deb. int., and the letter to the shhldrs. states that it is essential, if the company's fortunes are to be retrieved, that the present cap. charges should be substantially reduced and that fresh cap. in the form of cash should be provided. Messrs. Lazard Bros. have co-operated in the preparatn. of a scheme which will ensure the provision of

Digitized by Google

£750 000 of new cap. by the subscriptn. in cash of ord. ssh. at par. Amongst the proposals are (1) extension of period for repaymt. of 5½% debs. from 1940 to 1960, (2) conversion of 6% deb. stk. to the extent of 50% into 6½% pref. shs. and 15% into £1 ord. shs., the remaining 35% of 6% deb. stk. to become non-convertible, (3) the writing down of pref. shs. from 20s. to 12s. 6d. p. sh., of which 10s. p. sh. will be represented by pref. shs. and 2s. 6d. p. sh. by ord. shs., the reduced pref. and ord. shs. to be consolidated into shs. of £1 each (reduction of pref. shs. amtg. to £368 838), and rate of div. on pref. shs. to be raised from 6% to 6½%, (4) the writing down of issued ord. shs. from 20s. to 3s. 4d. p. sh. (a reduction of £1 386 690) and their consolidation into £1 shares. It is the intentn. to reconstruct the board and existg. directors have given undertakg. to resign if called upon to do so by Lazard Bros. and Co., and to elect the nominees of that firm in place of the directors so retiring. The control of the company will, however, remain, as heretofore, in British hands. Provided the scheme is carried through by June 30th next, Messrs. Lazard Bros. and Co. have agreed, on behalf of themselves and their associates, to subscribe at par and to pay up in cash within fourteen days of the scheme becoming operative, £750 000 of ord. shs. in the cap. of the company as reorganised. This new cap. will enable all bank overdrafts to be liquidated, and will provide a substantial sum for re-equipmt. The capitalisatn. of the company, if the scheme becomes operative, will (subject to adjustmt. in respect of fractns.) be as follows:—5½% sinkg. fund 1st mtgge. deb., £656 200; 6% deb. stk., £450 863; 6½% pref. shs., £1 135 874; ord. shs., £1 343 511. Mtgs. to consider the scheme are called for Feb. 25.

Company Meetings.

Aldershot Gas, Water and District Lighting Co.—Mr. R. W. Edwards, presiding at the meeting last week, said the electricity department had shown further development during 1929. The advance in sales was 16·2%, and in this the increase for other than lighting was 35.3%. The following apparatus has been fixed during 1929: lamps 5 690, motors 11, fires 180, cooking apparatus 23, sweepers 76, irons 57, miscellaneous 59. The price for lighting was reduced, between Christmas 1928 and Christmas 1929, by 0·9d. The price for purposes other than lighting has also been reduced by 1d. per kWh during the same period. The company will shortly make an issue of 5% perpetual deb. stk.

Traction and General Investment Trust, Ltd.—Mr. H. A. Vernet, presiding at the meeting on January 30th, said, the amount of interest and dividends received, £122 945 compared with £107 879 for 1928; and after payment of management expenses and interest on debenture stock, the balance carried to the balance sheet was £85 957, against £74 432. Deducting preference dividend, £22 206, there remained available for the ordinary stock £63 752. The directors proposed a dividend of 17%, which requires £45 302 and left a surplus for the year of £18 450. They had transferred £11 739 6s. to the reserve account, bringing that account up to a round £325 000. The balance remaining to be carried forward amounted to £42 508, the equivalent of about 16% on their ordinary stock, and compared with £35 797 brought in. He trusted that, in the circumstances, they would not be deemed extravagant in proposing an increase of 1% in the dividend on the ordinary stock. The report and accounts were adopted, the payment of interim dividends of 2½% on the preference stock and 6% on the ordinary stock (less tax) were confirmed, and final dividends of 2½% on the preference stock and 11% on the ordinary stock (less tax) were approved.

Perak River Hydro-Electric Power Co., Ltd.—Viscount Elibank, presiding at the adjourned annual meeting on January 29th, said the important matter to be considered was the increased cost which had been incurred on the original scheme, and the plan now proposed for financing both that and the extension of the Malim Nawar steam station—also the approval now sought to the loan of £850 000 by the Federated Malay States Government, secured by a charge ranking in front of the 7% participating debenture stock. It was a matter of real help and importance to the undertaking that it had been possible to obtain the offer of so large a sum of £850 000 at so low a rate of interest and without incurring the usual costs of raising capital. Until solid rock had been reached for the foundations of the massive dam superstructure it had not been possible to forecast with any certainty the probable ultimate cost. It had been the cost of the civil engineering work which had been the more largely exceeded; the electrical engineering works should not exceed by more than 10% the original estimate. The board had settled with the contractors a fixed sum for the completion of the dam and power house, and had done all they could to ensure that the estimated excess cost of £600 000 could not be further increased. The Federated Malay States Government had agreed to advance the required sum of £850 000 at the low rate of 5% ranking after the 5% debenture stock, and, naturally, prior to the 7% participating debenture stock. When completed the construction scheme would enable them to sell 160 000 000 kWh per annum, and they were already generating 75 000 000 per annum. In their concession area there was prospective business corresponding to an output of at least 400 000 000 kWh per annum which had not yet been tapped. The proposals of the board were approved.

New Companies.

Northern Rhodesia Power Corporation, Ltd.—Cap., £330 000. Electric supply company. Reg. Office: 4, London Wall Buildings. London, E.C.2.

Hilyer and Marchant, Ltd.—Cap., £2 000. Shop fitters, electrical engineers, etc. Reg. Office: 83, Lancefield Street, Queens Park, London, N.W.10.

Lacys (Leeds), Ltd.—Cap., £2 000. Manufacturers of and dealers in articles connected with electric lighting, wireless telegraphy, telephones, etc. Reg. Office: 18, St. Ann Street, Leeds.

Ryland's Electrical Co., Ltd.—Cap., £1 000. Electrical engineers, contractors and agents for and factors of electrical equipment, etc. Reg. Office: York House, 42A, Goodmayes Road, Goodmayes.

Ramsbottom Electrical Heating and Lighting Co., Ltd.—Cap., £500. Electricians, electrical engineers and contractors, dealers in electricity, wireless sets, etc. Reg. Office: 25, Bridge Street, Ramsbottom.

Light, Power and Music, Ltd.—Cap., £3 000. Electricians dealers in electricity, motive power, heat and light, wiring contractors, concert hall proprietors, etc. Reg. Office: 22 and 23, Laurence Pountney Lane, Cannon Street, London, E.C.

Chorlton Radio and Cycle Co., Ltd.—Cap., £100. Manufacturers of, agents for and dealers in electrical and other instruments, appliances, supplies and components, connected with wireless telegraphy, etc. Reg. Office: 41, John Dalton Street, Manchester.

Telephone Manufacturing Co., Ltd.—Cap., £250 000. To acquire the business carried on by Telephone Manufacturing Co., Ltd., other than shares in the subsidiary companies referred to in an agreement with F. C. T. Lane and Telephone Rentals, Ltd., and to carry on the business of makers, sellers, installers, etc., of private or other telephones and telegraphs, makers and sellers of electrical apparatus, etc. Reg. Office: Hollingsworth Works, Martell Road, West Dulwich, London, S.E.21. (Public Co.)

THE LEAD MARKET.

According to James Forster and Co. there was little change last week, the rise of 3s. 9d. per ton for January lead being purely a market condition owing to the belated closing of a short account.

Closing prices on January 31st were £21 15s. for January, £21 11s. 3d. for February, March and April, 3s. 9d. up to unchanged on the week.

Notices of Intended Dividends.

GATESHILL, Harry, 113, Witham, Kingston-upon-Hull, wireless engineer. Last day for receiving proofs, February 8th. Trustee, J. E. D. Stickney, 37, Scale Lane, Hull, Official Receiver.

JONES, Thomas Ernest (trading as BERRINGTON JONES), 138, Northgate Street, Chester, electrical engineer. Last day for receiving proofs, February 17th. Trustee, W. F. Small, 5, Hunter Street, Chester.

PEOVER, Harry, electrical apparatus and tool merchant, Market Lane, Newcastle-upon-Tyne. Last day for receiving proofs, February 15th. Trustee, R. K. Clark, 81, St. Mary's Place, Newcastle-upon-Tyne, Official Receiver.

THORNTON, William Haigh, 25, Bridge Street, Burnley, electrical and wireless engineer. Last day for receiving proofs, February 8th. Trustee, J. W. Carter, District Bank Chambers, Blackburn, Official Receiver.

Partnerships Dissolved.

CASSÉ AND WALKER (Harry Herbert CASSÉ and Norman WALKER), electricians, 2, St. Jude's Place, Bradford, by mutual consent as from December 31st, 1929. Debts received and paid by N. Walker, who will continue business on his own account at 2, St. Jude's Place. H. H. Cassé will carry on business on his own account at 29, Chapel Street, Bradford.

GREENWOOD AND LISTER (Denis GREENWOOD and Allan LISTER), electrical contractors and gramophone dealers, 25, Albert Road, Barnoldswick, Yorks, as from December 22nd, 1929, by mutual consent. Debts received and paid by A. Lister.

KAY AND MORRIS (Thomas KAY and William Benjamin Woods MORRIS), electrical engineers, 176, North Road, Preston, June 14th, 1929, by mutual consent. Debts received and paid by T. Kay, by whom the business will be carried on.

C. S. MAYFIELD AND CO. (Charles Smyth MAYFIELD and Frank Maynard CRANE), electrical contractors and gramophone stores, 67, Carshalton Road, Carshalton, Surrey, by mutual consent as from December 28th, 1929. Debts received and paid by F. M. Crane.

ROSSALL-CANTY RADIO COMPANY (Michael John CANTY and Thomas Richard ROSSALL), radio engineers, manufacturers and distributors, 28, Paradise Street, Liverpool, by mutual consent as from January 20th, 1930. Debts received or paid by M. J. Canty. The business will be carried on by T. R. Rossall.

STATION (ROAD) GARAGE AND ORCHESTRON RADIO MANUFACTURING COMPANY (Alfred Graham JEFFERIES and Richard CHAPMAN), wireless and motor engineers, Station (Road) Garage, Warminster, Wilts, by mutual consent as from December 24th, 1929. Debts received and paid by R. Chapman, who will continue the business.

Winding-up Petitions.

ELECTRICAL STORAGE CO.'S PETITION.

In the Companies Court on Monday, Mr. Justice Maugham had before him the petition of the Chloride Electrical Storage Co., Ltd., of Manchester, for an order for the compulsory liquidation of British Talking Pictures, Ltd. Mr. Cecil Turner, for the petitioners, said the petition was supported by creditors for £47 508 and opposed by creditors for £94 000. A committee of creditors had been appointed, who believed that the assets of the company, which were substantial, could best be preserved by an adjournment and an arrangement.—Mr. Lionel Cohen, K.C., for the supporting creditors, said they supported the proposal for a month's adjournment and for the appointment of a provisional liquidator in the meantime.—Mr. Heckscher, for the opposing creditors, agreed to this course.—Mr. Cohen said that as the result of the scheme that had been drafted it was hoped that all the creditors would be paid in full.—His lordship assented to the arrangement for a month's adjournment and the appointment of the Official Receiver as provisional liquidator in the meantime. Mr. Cohen mentioned that among the creditors supporting the petition were the General Electric Co., Radio Instruments, Ltd., and the Plessey Co.

GRAMOPHONE CABINETS, LTD.

Mr. Justice Maugham, in the Companies Court on Monday, again had before him the petition of the London Electrical Co., of Sherborne Lane, E.C., for an order for the compulsory liquidation of Gramophone Cabinets, Ltd.—For the petitioners Mr. Swords said it had been suggested that as the result of certain actions the respondent company would obtain money, but the petitioners were not satisfied with that.—Mr. Christie, for the respondent company, said its liabilities were £5 000 and it had obtained judgment for £10 000 against another company which could not be enforced at present. The latter company had a substantial claim against another company which, if successful would result in the respondent company's creditors being paid in full. He asked for a month's adjournment.—His lordship assented.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

320 893 A. J. Stephens (M. H. Loughbridge). System and apparatus for the electrical recording and reproducing of sound. (23/7/28.)
320 875 F. Merk. Switching-apparatus, particularly applicable to automatic telephone systems. (23/7/28.)
320 876 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes. (23/7/28.)
320 895 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric fuses. (23/7/28.)
298 219 K. Schnell. Electric plug-and-socket contacts. (6/10/27.)
320 813 J. D. Hindley-Smith and S. H. Holmes. Time controlled and operated electric switches. (24/5/29.)
320 928 British Insulated Cables, Ltd., and J. G. Lauder. Extrusion of metal. (24/7/28.)
320 901 H. Weichsel and B. McCormick. Alternating-current motors. (24/7/28.)
320 902 A. L. Jennings. Illuminated signs for advertising and like purposes. (25/7/28.)
320 903 Three Star Accumulators, Ltd., and F. C. Grund. Two-position non-spill galvanic cells. (25/7/28.)
320 905 Standard Telephones and Cables, Ltd., E. P. G. Wright, J. H. E. Baker, and C. M. Colebrook. Automatic or semi-automatic telephone systems. (25/7/28.)
320 908 A. C. Johnson. Control apparatus for combined electric lighting and heating or like installations. (25/7/28.)
320 931 J. F. Gill and J. N. Chaviara. Induction dynamo-electric machines. (25/7/28.)
320 936 Hotpoint Electric Appliance Co., Ltd., and W. J. Sims. Earthing-devices for the metallic sheathings of electric resistance elements. (26/7/28.)
320 938 Automatic Telephone Manufacturing Co., Ltd., R. Taylor and L. M. Simpson. Telephone systems. (26/7/28.)
320 942 V. E. Richards. Apparatus for forming the depolarising element of primary electric cells. (27/7/28.)
320 944 F. E. A. B. Sewell. Wireless receiving and analogous circuits, and thermionic valves therefor. (27/7/28.)
320 950 Standard Telephones and Cables, Ltd., L. C. Pocock and R. Blackburn. Telephone transmitters. (28/7/28.)
320 952 Soc. Chimique de la Seine and V. Szidon. Method of electrolytically depositing chromium. (28/7/28.)
320 953 British Thomson-Houston Co., Ltd., and E. Regis. Liquid-tight joints for connectors in liquid-filled bushings. (28/7/28.)
320 954 British Thomson-Houston Co., Ltd., and H. L. Satchell. Machines for winding tape and the like on to strip or like material. (28/7/28.)
320 955 British Thomson-Houston Co., Ltd., and H. L. Satchell. Taping and like machines. (28/7/28.)
294 939 Vreeland Corporation. Band-receiving systems for wireless telephony and the like. (1/8/27.)
299 033 Associated Telephone and Telegraph Co. Telephone systems (21/10/27.)
295 321 E. H. Norinder. Cathode ray oscillographs. (9/8/27.)
320 968 A. Reyrolle and Co., Ltd., H. Leben and N. Cooke. Electric protective systems. (31/7/28.)
320 969 A. Reyrolle and Co., Ltd., and H. Leben. Electric protective systems. (31/7/28.)
299 864 A. Lindahl A. M. V. Hultgren and S. H. Ahde. Electromagnetic couplings (3/11/27.)
320 981 S. G. Brown. Electromagnetic devices for reproducing sound from records. (10/8/28.)
295 589 A. Helbronner and E. Dutt. Manufacture of electric batteries. (11/8/27.)

Applications for Patents.

October 17th.

31 611 Telefunken Ges. fur Drahtlose Telegraphie. High potential coupling condensers. (27/10/28, Germany.)
31 589 G. V. Twiss. Overhead transmission systems.

October 18th.

31 691 A. Massy-Allen and North and Sons, Ltd. Magneto-electric machines.
31 742 Associated Telephone and Telegraph Co. Telephone, etc., systems. (30/11/28, U.S.)
31 703 Associated Telephone and Telegraph Co., and H. F. Farmer. Means for insulating studs, etc.
31 706 Associated Telephone and Telegraph Co. Electric control systems. (23/10/28, U.S.)
31 667 W. Engelke. Light sensitive apparatus.
31 716 C. C. Garrard and General Electric Co., Ltd. Protection of electrical machines.
31 684 A. Graham and Co., Ltd., and C. H. Vaughan. Electric signalling devices for ships.
31 754 Gramophone Co., Ltd. (Victor Talking Machine Co.). Volume control for wireless systems.
31 705 International General Electric Co., Inc. Insulating papers. (19/10/28, Germany.)
31 740 A. Mozer. Electrolytic separation of copper. (29/10/28, Germany.)
31 723 Siemens-Schuckertwerke Akt. Ges. Manufacture of electric cables. (23/10/28, Germany.)
31 734 Siemens-Schuckertwerke Akt. Ges. Movable dynamo. (19/10/28, Austria).
31 689 Siemens-Schuckertwerke Akt. Ges. Reducing cross talk in telephone lines. (25/9/29, Germany.)
31 701 Siemens-Schuckertwerke Akt. Ges. Glow cathode rectifiers. (27/10/28, Germany.)
31 733 Siemens-Schuckertwerke Akt. Ges. Dry batteries. (19/10/28, Germany.)
31 699 W. S. Smith and G. E. Stevenson. Telegraph and telephone system.
31 762 A. V. Summers. Electric water pipe heaters.

October 19th.

31 851 S. G. Brown. Electromagnetic devices.
31 792 C. R. Dunham, E. K. Sandeman and P. R. Thomas. Telephone systems.
31 817 International General Electric Co., Inc. Insulating tubing. (19/10/28, Germany.)
31 805 G. Isling. Galvanometers. (19/10/28, Sweden.)
31 849 Six-Sixty Radio Co., Ltd., and D. P. Wheeldon. Connecting devices for thermionic valves.
31 775 W. E. Sparks. Clock operated switch.
31 792 Standard Telephones and Cables, Ltd. Telephone systems.

October 21st.

31 919 Allmanna Svenska Elektriska Aktiebolaget. Starting electric motors. (27/10/28, Sweden.)
31 910 J. P. Annacker, and Astral Engineering Co. Electrical fuse units.
31 947 J. W. Bamfylde, and British and Dominions Ferallay, Ltd. Electrical resistance.
31 921 O. T. Banks. Portable electric lamps.
31 959 E. Berkeley. Production of electric condensers, etc.
31 930 V. Breeze, and A. West and Co., Ltd. Electromagnetic switches.
31 913 British Thomson-Houston Co., Ltd. Protective devices for induction motors. (23/10/28, U.S.)
31 914 British Thomson-Houston Co., Ltd. Electric furnaces. (23/10/28, U.S.)
31 904 W. J. Coombes. Electric lamps.
31 906 Coventry Automatic Telephones, Ltd., and C. W. Wilman. Telephone systems.
31 915 Edison Swan Electric Co., Ltd., and S. Rogers. Clips for wiring systems.
31 892 H. R. Hayden. Signal receiving system. (19/3/29, U.S.)
31 912 International General Electric Co., Inc. Devices for measuring high voltages. (20/10/28, Germany.)
31 989 R. B. Morgan. Electric discharge tube relays.
31 933 N. V. Philips' Gloeilampenfabrieken. Wireless signals. (29/10/28, Holland.)
31 952 J. W. Punter, and Tyer and Co., Ltd. Railway signalling instruments, etc.
31 883 C. T. Rhodes. Accumulator plates.
32 111 Siemens-Schuckertwerke Akt.-Ges. Draw-in or drop-out switch sets. (14/12/28, Germany.)

COMING EVENTS.

Friday, February 7th (To-day).

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Dr. R. L. Smith-Rose on "Radio Direction Finding by Transmission and Reception." 5.15 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London. Paper by Mr. G. F. Shotter on "A New Null Method of Testing Instrument Transformers and its Applications," Messrs. R. S. J. Spilsbury and A. H. M. Arnold on "Some Accessory Apparatus for Precise Measurements of Alternating Current," and Mr. A. H. M. Arnold on "Precision Testing of Current Transformers." 7 *p.m.*

North-East Institution of Engineers and Shipbuilders (Graduate Section).—Bolbec Hall, Newcastle-on-Tyne. Joint meeting with the Institution of Electrical Engineers Students' Section. Paper by Mr. W. G. Thompson on "The Electrical Propulsion of Ships." 7.15 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Paper by Mr. G. F. O'Riordan on "Co-operation between Technical Institutions and Industry." 7.30 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel, Sheffield. Annual Supper-Dance. 7.30 *p.m.* to 1 *a.m.*

Monday, February 10th.

Electrical Contractors' Association (Hastings Sub-Branch).—Lewcock's Restaurant. Ordinary meeting.

Electrical Contractors' Association. (Liverpool Branch).—Ordinary meeting. 3 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Paper by Messrs. T. W. Ross and H. G. Bell on "Recent Developments in the Protection of Three-Phase Transmission Lines and Feeders." 7 *p.m.*

Institution of Heating and Ventilating Engineers (Associate Members and Graduates' Section).—Borough Polytechnic, Borough Road, Southwark. Paper by Mr. B. T. Wingfield on "Automatic Control in Heating and Air Conditioning Installations." 7 *p.m.*

Tuesday, February 11th.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Ordinary meeting.

Royal Institution.—21, Albemarle Street, London, W. Lecture by Sir William Bragg on "X-Ray Determination of the Structure of Cellulose." 5.15 *p.m.*

Institution of Electrical Engineers (East Midland Sub-Centre).—The College, Loughborough. Paper by Mr. G. R. J. Parkinson on "Electrical Development." 6.45 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, Leeds. Paper by Dr. J. Hartmann on "The Jet-Wave Rectifier. The Experimental and Theoretical Basis of its Design." (To be illustrated by a cinematograph film.) 7 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers' 39, Victoria Street, London. Paper on "Mechanical Stokers and Their Auxiliaries." By A. W. Bennis. 7.15 *p.m.*

Institution of Electrical Engineers (Students' Section of the North-Western Centre).—Engineers' Club, Albert Square, Manchester. Paper by Mr. H. Breckell on "The Layout of a Distribution Scheme for a Small Township." 7.15 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Royal Technical College, Glasgow. Paper by Mr. W. B. Hird on "The Visit of the Institution to France." 7.30 *p.m.*

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting. 7.30 *p.m.*

Institute of Metals (North-East Coast Local Section).—Electrical Engineering Theatre, Armstrong College, Newcastle-on-Tyne. Paper by Mr. W. Richardson on "Electric Heating." 7.30 *p.m.*

Wednesday, February 12th.

Illuminating Engineering Society.—Prince's Galleries, Piccadilly, London. Annual dinner.

Institution of Electrical Engineers (London Students' Section).—Visit to Messrs. Doulton's, Ltd., Porcelain Insulator Factory, Lambeth. 2.30 *p.m.*

Institution of Railway Signal Engineers.—Institution of Electrical Engineers, Victoria Embankment, London. Annual general meeting and presidential address. 6 *p.m.*

Thursday, February 13th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Paper by Dr. J. Hartmann on "The Jet-Wave Rectifier. The Experimental and Theoretical Basis of its Design." (To be illustrated by a Cinematograph Film.) 6 *p.m.*

Electrical Wholesalers' Federation.—Savoy Hotel, Strand, London. Annual dinner. 6.30 for 7 p.m.

Institution of Electrical Engineers. (Dundee Sub-Centre).— University College, Dundee. Paper by Mr. G. H. Chalmers on "Lubrication." 7.30 *p.m.*

Optical Society.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington. Presidential address by Mr. F. Twyman, F.R.S., on "Optics in Radio Transmission and in other Fresh Fields." 7.30 *p.m.*

Friday, February 14th.

Incorporated Society of British Advertisers.—Hotel Cecil, Strand, London. Luncheon meeting of the Engineering Section. Speaker, Mr. E. E. Sharp on "Lessons from a Business Tour in Australia and New Zealand." 12.40 *for* 1 *p.m.*

Saturday, February 15th.

Institution of Electrical Engineers (North-Eastern Centre, Students' Section).—Joint visit with the N.E.C. Graduates to Messrs. Dorman, Long and Co., Middlesbrough.

Association of Mining Electrical Engineers (South Wales Branch).—South Wales Institute of Engineers, Park Place. Paper by Mr. W. A. Hutchings on "Safety and Efficiency in Mines." 6 *p.m.*

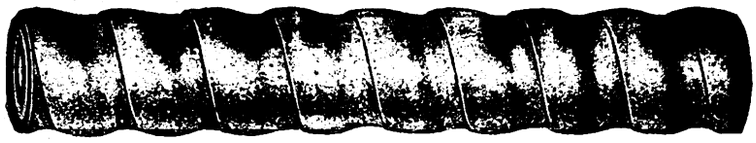
CONDEX PARK CABLE



"The specially applied steel tape armor guarantees protection"

CONDEX Park Cable is designed specially for use on series lighting circuits for municipal street lighting, "white way" or traffic signal installations and park, playground or airport illuminating systems.

The cable consists of an insulated, lead-covered conductor such as is ordinarily used for series street lighting circuits, protected by an overlapping, interlocking steel tape, under which is a bedding and over which is a serving of jute, both being thoroughly saturated with a preservative compound.

The CONDEX steel tape is the outstanding feature of the cable, affording complete coverage under all conditions and offering great resistance to crushing.

Another important feature is the thoroughness of the saturating process. A non-hardening compound is applied at four different stages of construction – over the lead, inner serve, CONDEX tape and finally the outer serve. This saturant acts as a preservative and prevents rotting or deterioration of the fabrics by moisture or other causes. It also completely covers the steel tape and protects it against rust.

CONDEX Park Cable solves distribution problems underground wherever park cable is required. Conduits are unnecessary; manholes need not be constructed and practically no digging is required to obtain a satisfactory installation.

Coal Mines Bill.

ONE of the most difficult tasks that must be achieved before there can be a complete restoration to health of our national economy is the rehabilitation of the coal industry. The fortunes of coal mining are so closely interlocked with iron and steel and so strongly affect other branches of manufacturing, transport, foreign trade and domestic life that it is a common duty to seek diligently for a way of enabling British collieries to regain that reasonable degree of prosperity without which no industry can thrive. We are once again confronted with a governmental attempt to deal with the coal problem. Past interference on the part of the State has been disastrous—indeed, it is not too much to say that a major share of the responsibility for the industry's present condition can be fairly laid to the charge of the several administrations which have, by submitting to political pressure, caused both coal owners and miners to shirk the task of putting their own house in order and look to the State whenever they find themselves in trouble. Is there any valid reason for hoping that the latest political move in this direction will have more fortunate results?

Certainly, in its present form, the Coal Mines Bill is calculated to arouse grave misgivings. The one certain effect that can be expected from it is an increase in the price of coal for internal consumption; other consequences are altogether conjectural. It is hoped, and the hope is shared by some electrical manufacturers, that a remunerative price for coal in the home market will not only enable the collieries again to become customers for electrical machinery and equipment, but will go far towards restoring the fortunes of the iron and steel companies which are themselves large colliery proprietors. If there was a reasonable likelihood that these important results would follow we should be less inclined to quarrel with the policy of the Bill. In effect these proposals amount to a subsidy to be extracted from consumers by means of an artificial price for coal instead of being drawn from the general revenue of the country. In 1925–26 a direct subsidy was given by Mr. BALDWIN'S Government in the hope of averting trouble and many millions of public money were thrown away. Can there be any guarantee that if dearer coal enables the mines to pay their way, they will not be at once faced with fresh demands for increased wages and shorter hours which will again upset their financial equilibrium?

Unless very extensive modifications are made in the Bill as originally introduced, it is difficult to believe that it will achieve sufficient good to compensate for the harm that will be caused by an increase in the cost of fuel, much less bring about a real recovery of the coal industry. Electricity supply undertakings will have a distinct grievance. They are accused of having obtained their coal too cheaply hitherto, but it must be borne in mind that the slack which is used at power stations had no market at all before they created an outlet for it. In doing so they relieved collieries of an embarrassing accumulation of previously unsaleable material for which any price obtainable was welcome. The notion that if a prosperous business can be discovered it is a legitimate object of spoliation is far too prevalent. Electricity undertakings have not been altogether fairly treated in connection with the De-rating Act, and a second attack from Westminster will hardly find them in an acquiescent frame of mind. They will not be altogether defenceless in the face of a heavy increase in the price of coal, for they possess the financial resources to enable them to pursue fuel economy to the limit and there is always fuel oil in the background.

It is one of the avowed objects of the Coal Mines Bill to bring about amalgamations of collieries which will permit the closing of old and inefficient pits, and so allow coal extraction to be concentrated at the more modern collieries. Yet there do not appear to be any adequate safeguards to prevent the price raising that is contemplated from acting as a draught of oxygen to the moribund pits. They may succeed in prolonging a miserable existence and helping to drag down the up-to-date collieries, or they may acquire a higher, but

Digitized by Google

fictitious, sale value, in which case any amalgamations that may be effected will start with an unduly large capitalisation. Either result will be evil. It may be said that the policy of leaving such pits to be killed by the operation of economic laws has been tried and has failed, or that at any rate the process is so slow that it is involving the whole industry in common ruin. That again may be largely attributed to the great dole of 1926. Yet in spite of the deep misgivings we entertain as to the soundness of the basic ideas upon which the Bill is built, we recognise that in the present political situation there is little likelihood that it will fail to reach the Statute Book. In these circumstances it is the duty of industry to take the broadest possible view of the situation and to endeavour to secure the introduction of amendments that will remove some of the worst features of the Bill. The Electricity Act of 1926 was an example of a measure which, in its final form, was to a great extent the result of collaboration by various branches of the electrical industry. It will be difficult to obtain the much more comprehensive collaboration needed to hammer the Coal Mines Bill into a shape that would at least secure a fair trial for the policy embodied in it. The Government will be well advised to make every effort to secure this collaboration. Its record of achievement will be coloured very strongly by the success or failure of its attempt to solve one of the most fundamental and complicated problems of British politics and economics.

Home and Export Orders.

POLITICAL uncertainty, the high money rates of the final quarter of last year, and other factors tending to check any tendency to pursue a forward policy, caused a sharp drop in electrical manufacturing for the home market last year. A fall in the index number from 92 in 1928 to 60 in 1929 was, however, counterbalanced by a rise in the export trade index number from 122 to 228. The figures for January 1930 are not yet complete, but we understand that they show a decided improvement in the home market, with export business well maintained. In the home market the grid scheme is providing a good deal of work for makers of generating plant, transformers, switchgear and cables, but the demand for industrial motors has been poor. Although export business is good it is secured in the face of intense international competition and at cut prices. The revival of the home demand is welcome, as the position that developed last year was upsetting the ratio between home and export trade that is necessary if a satisfactory margin of profit on the entire output is to be obtained.

British Industries Fair.

BOTH the Birmingham and London sections of the British Industries Fair will open on Monday to reveal much that is new in the electrical manufacturing world. By comparison with last year the 1930 Fair is larger, while the London section has the added attraction of being held in the enlarged Olympia instead of the lath and plaster pavilions of the "White City." The Birmingham section will be visited by Prince GEORGE on Thursday, and we gather that the number of overseas visitors who have arranged to view the exhibits during the show leaves far behind the known total at this time last year. One of the most outstanding features of the Fair is the fact that for the first time in history the main restaurant has been electrified and equipment is installed capable of providing luncheons for 1 000 persons every day and teas for 2 000. If the restaurant is patronised on the anticipated scale, 30 000 people will have been provided for during the run of the exhibition, many of whom will have enjoyed the benefits of electrical cooking for the first time. We give this week our first review of the stands and if the descriptions are necessarily brief, it will be appreciated that space requirements limit our review to the newest and most interesting apparatus. Should further information be desired the addresses of the exhibitors are given so that readers may communicate direct with the manufacturers concerned. The complete programme of entertainments to various associations connected with the industry and meetings is also given. It might be suggested that such functions should be more closely associated with the overseas buyer than with electrical organisations, but many exhibitors will no doubt arrange for overseas visitors to be present. The prospects are good and, favoured with better weather than that experienced a year ago, the 1930 Fair should give a substantial fillip to home and export trade.

E.D.A. for South Africa.

DR. H. J. van der BIJL, chairman of the South African Electricity Supply Commission recently read a paper before the Association of Municipal Electrical Engineers (Union and Rhodesian) in which he strongly advocated the formation of a South African Electrical Development Association. He suggested an assessment of 0·2 per cent. of the revenue of supply undertakings with a minimum annual contribution of £10 and a maximum of £500. This might yield between £5 000 and £6 000 in the first year. Support from big manufacturing corporations, their representatives, specialist firms, contractors and retailers might increase the proposed association's total revenue to about £9 000, which would be adequate for a campaign which would produce decisive results. Dr. van der BIJL paid a deserved tribute to the work done by the British E.D.A., under the direction of Lt.-Col. VIGNOLES, during the past four or five years and suggested that the South African association should base its organisation to a considerable extent on the British model. He proposed Johannesburg as the headquarters, with local branch offices in the Cape Province, the Orange Free State, Natal and Rhodesia.

Broadcasting Failure in India.

BROADCASTING in India has not proved successful and the Indian Broadcasting Company is to be wound up. The difficulty of collecting licence fees has been one of the chief obstacles to making ends meet; but perhaps the impossibility of pleasing such a multilingual community has been an equally serious obstacle. European listeners complained that too much of the transmissions was only of interest to Indians, and doubtless Bengalis, Gujeratis, Tamils, and other linguists felt that the other fellow was getting more than his share. At any rate an interesting attempt to provide India's continental medley of peoples with one of the latest Western diversions has had to be abandoned. It is but another demonstration of a fact which is far too little appreciated in this country—that India is much less a single national unit than Europe.

MOULDED INSULATING COMPOSITIONS.

Improved Quality and Increasing Variety—Development of New Processes—Important and Flourishing Industry—Cold and Hot Mouldings.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

MOULDED compositions have an initial importance in electrical design corresponding with that of their prototypes metal castings in mechanical construction, in that they make possible and convenient the use of specially shaped pieces which would otherwise be difficult and expensive to form. It is not surprising therefore that the manufacture and use of moulded insulation have attracted considerable attention, resulting in the development of materials of improved quality and increasing variety. In recent years a considerable number of new processes have been developed, helped greatly by the fact that a very extensive market apart from electrical work has been found for many of the products, and the manufacture of moulded compositions is now an important and flourishing industry with at least one illustrated journal in this country entirely devoted to its interests.

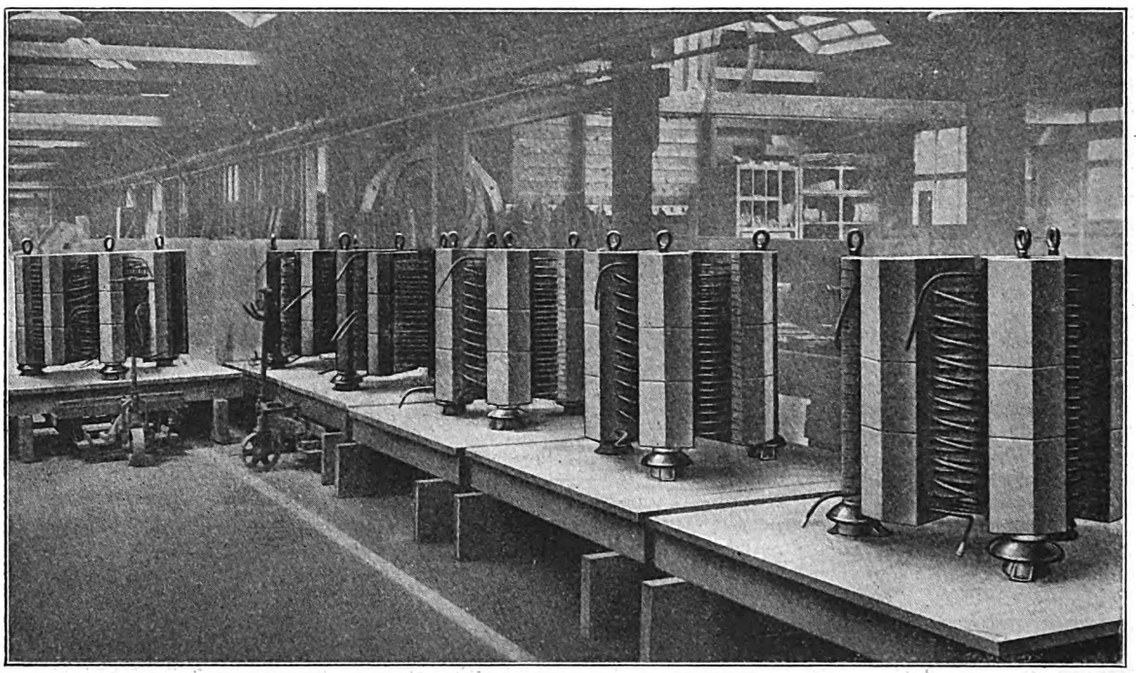

Fig. 1.—Concrete mounted reactance coils in the cement moulding shop.

The materials now available include in particular compositions of hydraulic (portland or similar) cement, bitumens, natural clays, natural resins and gums, synthetic resins, rubber, cellulose compounds, and casein. The products of these bonding materials with various other materials used as fillers constitute such a variety and are described by such a multiplicity of class names and special trade names that they must be a subject of some confusion to many electrical engineers.

At the outset it may be helpful to indicate a simple method by means of which a sample of moulded composition may usually be identified with regard to its basis or bonding material. This method consists in applying a flame—a burning match will do—to the sample and noting the result, especially the smell produced. Under this test materials with a basis of hydraulic cement or natural clays are unaffected; bitumens burn with a smell of pitch; resins and gums soften and burn with a smell somewhat like that of sealing wax; synthetic resins can be detected by the smell of phenol, which is like carbolic; cellulose burns slowly, the line of flame being preceded by blisters and bubbles in the material; casein burns with a spluttering flame and gives off a distinct smell of cheese. Since moulded composition almost invariably assumes the characteristics of its basis material, the burning test will often give an immediate and fairly reliable indication of the service for which the material may be suitable.

As regards method of manufacture moulded compositions may be divided into two classes, one class including those produced with bonds which are plastic at atmospheric temperature and solidify on exposure to the atmosphere, and the other class produced with bonds which become plastic under the influence of heat.

Cold mouldings include compositions with a basis of hydraulic cements, natural clays and sodium silicate. Plain hydraulic cement mouldings are made in moulds without pressure. The applications for such material are not many, but an example is illustrated in Fig. 1, which shows a group of reactance coils in the cement moulding shop of the Metropolitan-Vickers Electrical Co. The turns of each coil are embedded in a supporting frame of concrete. Cement compositions in which asbestos is used as a filler are generally moulded under pressure. Silicate of soda is sometimes used as a bonder for asbestos, but its use is very limited owing to its unfortunate tendency to develop a hairy crystalline growth in a damp atmosphere. Porcelains, steatite and other earthenware materials are also, of course, cold moulded compositions, but since they are not ordinarily so described and since they demand separate consideration, they are not included in this review.

The hot moulding compositions most extensively used in electrical work are those of bitumen, rubber, natural and synthetic resins, cellulose compounds and casein. In practically all cases they are pressure moulded. In some cases the pressing is done in two operations, the first in a preliminary or briquetting press and the second in a heavy power press.

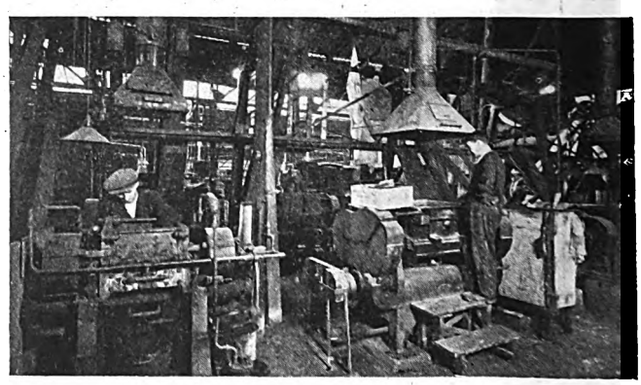

Fig. 2.—Mixing and rolling equipment.

In many cases also the process includes a curing period in heated ovens after the final pressing. Where the composition has to be cured under pressure it is often compressed in moulds which are clamped up while under the weight of the press and then removed to the ovens so as to free the presses for other work. Figs. 2, 3, 4, 5 and 6 show equipment and

operations, typical of moulded composition manufacture, in the works of Ebonestos Insulators, Ltd.

Bitumen compositions often include fillers of wood flour, pulverised paper, cotton, asbestos, etc. The materials are mixed hot in special machines, briquetted, heated to about 100 deg. C., and pressed to shape in power presses. In most cases such materials require no further curing. Fig. 7 shows a group of moulded composition parts made by the Metropolitan-Vickers Electrical Co. Some of the items, including the meter terminal block on the left are bitumen mouldings;

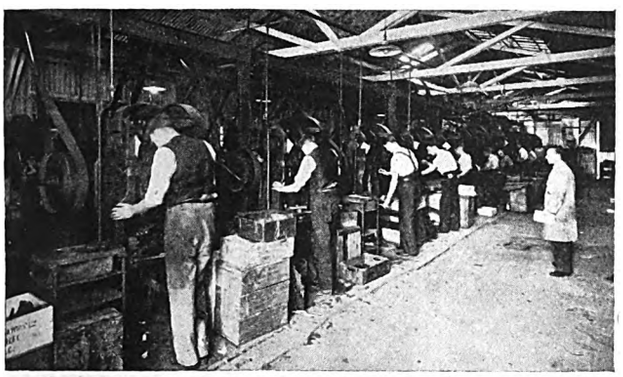

Fig. 3.—Briquetting presses.

the others are of synthetic resin basis with wood flour or asbestos fillers. In these and also in other compositions it is usually easy to incorporate metal inserts in the moulding. Some examples can be seen in the illustration.

Synthetic resin compositions are pressure moulded at a temperature of about 150 deg. C., at which temperature the resin fluxes. Unlike bitumen, however, the plastic synthetic resin changes quickly into its final solid form at the moulding temperature, and does not again soften even when raised to higher temperatures. Compositions of natural resins or gums, including shellac, are moulded at a temperature of about 80 deg. C. to 100 deg. C., and since they are permanently liable to soften if this temperature is approached they are not suitable for other than low temperature service.

Ebonite, vulcanite, stabilite and similar materials are rubber which have been subjected to a more or less extreme vulcanisation process, in which it is masticated with sulphur or antimony sulphide and subjected to a temperature of about 140 deg. C. for a period of some hours. Rubber compositions, like those of bitumens and natural resins soften if again heated even to moderate temperatures.

Regarding the newer developments of cellulose compounds and casein products it is extremely difficult to generalise, for

Fig. 4.—Power presses.

the commercial development of these materials has been very rapid and very varied, and much of the information regarding the processes is still closely guarded as trade secrets. Some indication of this state of affairs is given in connection with a description of cellulose acetate plastics published in "British Plastics" as recently as September, 1929, and regarding which an editor's note states that it is believed to be the first time such information has been published in a trade journal.

Cellulose compounds are mainly of two kinds, cellulose acetate and cellulose nitrate. Both appear to be used either with or without fillers and both materials can be obtained in the raw state for moulding, though they are more generally known in the state of finished mouldings, many of which, as also the products of casein, have an exquisitely fine appearance. Some of the trade names of the mouldings indicate their basic composition, as for instance "celastoid" and "cellastine." It is stated that cellulose acetate itself has a softening point of about 220 deg. C., but that this is lowered by the addition of certain other materials, so that the plastics can be moulded at temperatures ranging from 120 deg. C. to 190 deg. C. Cellulose nitrate, which is moulded at lower temperatures, is much used for decorative pieces of simple shape, but on account of inflammability is unsuitable for electrical work.

It may be mentioned that in the manufacture of cellulose compounds and some other moulding compositions there is a tendency to develop lower working temperatures and pressures for convenience of production. In electrical applications an opposite tendency, that is, in the direction of higher moulding temperatures and pressures, is desirable.

Casein is a product of milk. An American product, which is claimed to be the first casein composition, is known as "galalith"—the name signifying milk-stone. Among British casein compositions probably the best known are erinoid and xylonite. In cows' milk, which is chiefly used, the casein content is stated to be about 3 per cent. For the manufacture of plastic casein the milk is curdled with rennet as in cheese making. The curd is drained, pressed into cakes, ground in

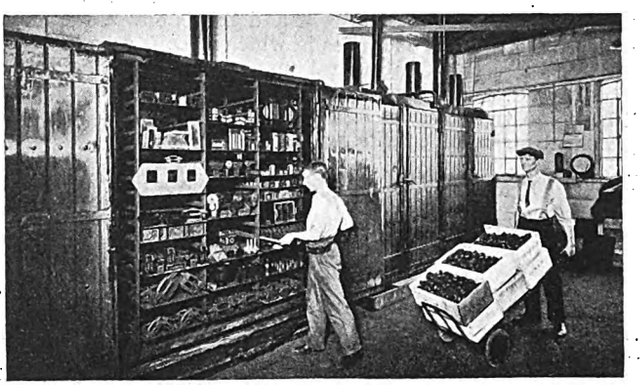

Fig. 5.—Curing ovens.

a mill and dried at a temperature of about 120 deg. F. The material is worked into rod, tube or sheet form, in which it is at first brittle but after further seasoning processes it becomes tough and usable. It should be mentioned that up to the present casein compositions are not general purpose mouldings. The sheets, rods or tubes can be softened by immersion in hot water and pressed into simple shapes but the material is not as yet suitable for thick mouldings or intricate shapes on account of its limited plasticity and the difficulty of "curing" the material in any considerable thickness.

In reviewing the various moulded insulating compositions used in the electrical industry it is convenient to classify them under the following headings according to the severity of the conditions they have to withstand :—

1. Arc-resisting materials.
2. Heat-resisting materials.
3. Hot service materials.
4. Moderate temperature service materials.
5. Normal temperature service materials.

In the absence of any British standard classification it is difficult to define the definite temperature ranges applicable to the grades above indicated, but for practical purposes the essential features may be stated as follows :—

1. Arc-resisting materials should be non-ignitable.
2. Heat-resisting materials, for such service in connectors for domestic heating equipments, should show no deformation under a bending stress of 160 lbs. per sq. in. of cross section at a temperature of 250–300 deg. C.
3. Hot service materials for safe service up to about 90 deg. C., should withstand stress as in 2 at a temperature of 120–130 deg. C.
4. Moderate temperature service materials, should withstand stress as in 2 at 90 deg. C.
5. Normal temperature service materials are for use generally at atmospheric temperatures but should show no deformation under stress at 60 deg. C.

Analysis of the requirements in regard to temperature ranges are briefly summarised in the following paragraph.

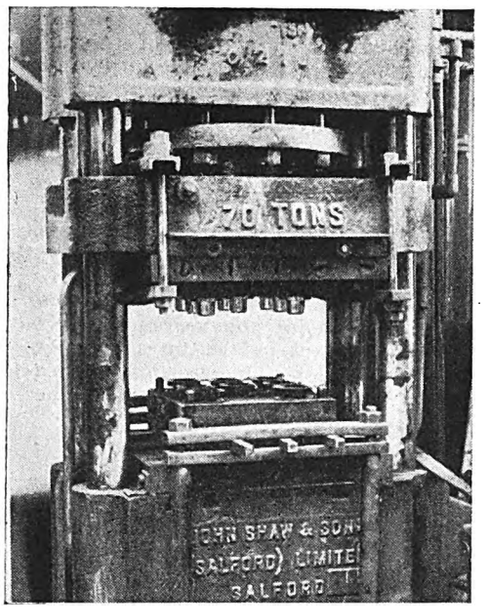

Fig. 6.—Multiple-tool power press for final hot-moulding.

In this broad classification each of the sections comprises a considerable number of subdivisions according to the characteristics which are most desirable for particular applications, as, for instance, where mechanical or electrical strength is more important, or where service in hot oil is required, or service in a humid atmosphere or in the presence of chemical fumes.

Table 1 shows a classification which has been issued by the V.D.E. after several years of work and this is now a standard service table for those countries in which V.D.E. standardisations are adopted. Continental materials usually bear the special V.D.E. mark and the appropriate class number. It will be noted that in this classification both temperature and mechanical strength considerations are taken into account. Such a classification is a valuable help in avoiding the use of materials for wrong purposes and for this reason the issue of a British specification is very desirable.

TABLE 1.

V.D.E. CLASSIFICATION OF MOULDED INSULATING COMPOSITION.

Class.	Heat-resistance.	Shearing strength.
I.	At least 150 deg. C.	At least 500 kg./sq. cm.
II.	,, ,, ,,	350–500 ,, ,, ,,
III.	,, ,, ,,	200–350 ,, ,, ,,
IV.	,, ,, ,,	150–200 ,, ,, ,,
V.	,, ,, ,,	up to 150 ,, ,, ,,
VI.	100 deg. C.–150 deg. C.	Not less than 350 ,, ,, ,,
VII.	65 deg. C.–100 deg. C.	,, ,, ,, 250 ,, ,, ,,
VIII.	45 deg. C.–65 deg. C.	,, ,, ,, 125 ,, ,, ,,
IX.	Less than 45 deg. C.	,, ,, ,, 125 ,, ,, ,,

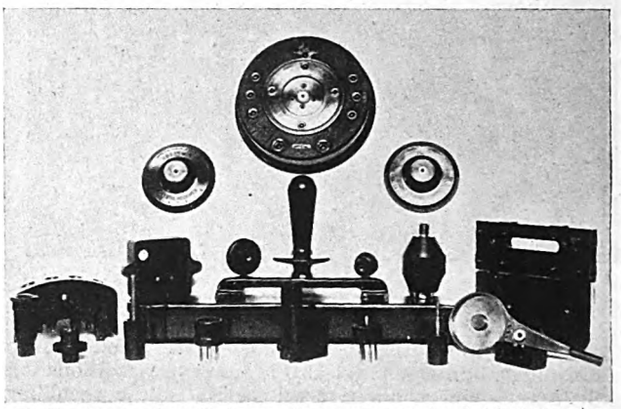

Fig. 7.—A group of moulded composition components for electrical apparatus.

(The concluding part of this article will deal with the physical and electrical characteristics of materials in the classification suggested and give some account of the methods of testing.)

ELECTRIFICATION IN AUSTRIA.

843 km. of Railways Converted Since 1923—Hydro-electric Developments—Increasing Sale of Current to Germany.

BETWEEN the beginning of 1923 and the end of 1928 about £7 000 000 was spent on the electrification of 730 km. of the Austrian Federal Railways, this representing 15% of the total length of the system. The existing programme, which includes the electrification of the railways west of Salzburg (an additional 113 km.) is practically completed.

According to a report by Mr. A. S. Phillpots, O.B.E. (Commercial Secretary to H.M.'s Legation, Vienna) on Economic Conditions in Austria, issued by the Department of Overseas Trade (Stationery Office, 2s. net), "No final decision has yet been reached as to whether the electrification has been a success in Austria from a purely financial point of view when the comparatively high rate of interest (about 10½% with amortisation) payable on the League of Nations Loan is taken into account." For this and other reasons the decision, taken two years ago, to suspend further electrification has not been changed in spite of pressure from manufacturers.

During the past two years hydro-electric works yielding an additional 55 000 H.P. (yearly mean) and more than double this amount when sufficient water is available, have been completed. More power than is required is now developed in the Austrian (the most mountainous) part of the country and the sale of current to Germany is increasing. Contracts for the export of power are limited by law to 25 years. The Ill works in Vorarlberg are in the hands of an important German company. Other provinces are less disposed to part with control of their water power to foreign interests, although American, Italian and Swiss capital has been raised by bond issues.

Between 1919 and the end of 1928 hydro-electric installations of more than 500 H.P. each to the number of 117 were installed. The mean H.P. developed is 170 809, or a maximum of 1 003 000 000 kWh. Most of these works belong to public utility companies in which the Austrian Government is interested. Federal Railways installations produce 6 600 H.P. but also buy power from the companies. Since the war the pre-war output in Austria has been almost doubled and works are now under construction which will produce an additional 113 900 mean H.P. or 667 000 000 kWh, chiefly in Vorarlberg and Tyrol.

Two large undertakings to exploit the water power of the Danube in lower Austria, one outside Vienna and the other higher up the river at Persenberg, are projected and are being examined by Government authorities. Either would yield about 150 000 H.P. and part of the power from Persenberg could probably be sold to Germany. The approval of the International Danube Commission would be required for either of these schemes. A still more ambitious project for obtaining power from the Grossglockner Mountain region is favoured by the authorities of the Salzburg province. A fall of 4 500 feet in three stages would be utilised. "Hanging canals," hundreds of kilometres in length and nearly 50 km. of tunnels would be needed. The available H.P. is estimated at 2 100 000 (6 160 000 000 kWh), equivalent to the power obtainable from 4 000 000 tons of coal. Central and Northern Germany would be the chief markets for the energy. One of the leading German manufacturing firms is said to have worked out the plans. The work might take about ten years to complete.

A syndicate of Vienna banks is likely to obtain the concession for the use of the water of the Inn, the Pitzbach and the Oetzthaler Ache to produce 67 000 H.P., in which case all orders will go to Austrian undertakings. The Zillerthal works in Tyrol, which have been begun, chiefly for the supply of current to Germany, are to be extended to produce an additional 30 000 H.P., and the German company which is exploiting the Ill may obtain a further 150 000 H.P. from the Luener Lake in Vorarlberg. Difficulties of financing are, however, likely to defer execution of some of these plans.

Austria exports large quantities of cheap radio valves and loud speaker units to Great Britain. In 1928 total exports of radio apparatus amounted to £218 000, of which Great Britain, the largest customer, took £60 000 worth, followed by Germany with £38 000. The report adds that the English lessons, given as part of the Vienna broadcasting programme by a British subject, have achieved great popularity and are doing much to spread the knowledge of the English language in that part of Europe.

H.T. JOINTS IN MINES.

Special Features of Colliery Work—Gripping Devices to Eliminate Sweating and Plumbing—Tape and Paper Tube Insulation—Expansion of Compound.

AT a meeting of the London Branch of the Association of Mining Electrical Engineers, held in the rooms of the Junior Institution of Engineers, on February 4th, Mr. C. Grover presented a paper on the design and construction of e.h.t. joints. He said that the electrical equipment of a modern colliery in the aggregate demanded electrical energy of a bulk commensurate with the needs of a town having a population of 20 000 to 30 000 people, whilst the area over which electrical energy had to be distributed for the colliery demanded the use of long feeders. Several instances might be cited of a group of collieries covering a considerable area being fed by one, two or three generating stations linked together and delivering energy to the individual collieries of the group, thus following ordinary practice for supply of electrical energy for industrial purposes. This practice necessitated the use of transmission voltages up to 33 000, and before long higher pressures would probably be used.

The depths of shafts and the distances over which energy has to be transmitted below ground generally limited the transmission pressure to 3 300 V. The exceptional conditions under which joints and terminal boxes had to be constructed called for more than ordinary care.

Prohibition of the use of naked lights had led to the evolution of designs of fittings wherein sweating and plumbing were eliminated by the use of mechnical gripping devices. Various types of gripping devices had been marketed for jointing conductors. These fittings were usually tinned so that they could be sweated if possible, and this feature made them suitable for any class of work up to, say, 3 300 V.

Vital parts of a colliery jointing box were the glands for sealing the cable into the box and the armour grip. An efficient gland which gripped the cable without damaging it had a malleable iron casing containing a lead cone bored to suit the diameter of the lead of the cable. This was split into halves longitudinally, and an outer casting with a coned interior similar to the malleable iron casing, when drawn up by the nuts, tightly gripped the cable lead. The ends of the main cast iron box and the face of the malleable casting adjacent to one another, were machine faced and between them was fitted an annular tinned copper collar, so that when the gland was tightened up, this collar was firmly gripped. Each end of the box was fitted with these collars, which were securely bonded together with a stout copper strip, which formed the main bond between the cable leads, via the lead cones. Tests had shown that the conductivity of this system of bonding was less than that of the corresponding length of armouring between the glands. The armouring wires were gripped between the malleable iron casing and the cast iron grip so that the armouring of the cable was also efficiently bonded. The necessary longitudinal strength was, moreover, imparted to the joint and cable as a whole, relieving the interior of stress.

It was essential that at the higher voltages conductor joints should be smooth and free from sharp edges to preclude intensified local electric stresses. From three to four diameters of the conductor was an appropriate length for a conductor joint, and ¼ inch of bare conductor between the paper insulation of the core and the end of the joint on either side was adequate for working purposes, for all insulation removed had to be replaced by some means or other, so obviously the less removed, the better. Great care was necessary in cutting the cores of multi-core cables to ensure that each were of the same length, otherwise some would bulge more than others, resulting in dissymmetry of the joint as a whole. Impregnated linen tapes could be safely used for pressures up to 3 300 V, but as every bit applied had to be handled, its use for higher pressures was not generally encouraged. For 6 600 V and upwards, paper tubing insulation was mostly used instead of impregnated or prepared linen tapes. These should either be of an open construction so as to permit the free flow of the filling compound through them, or tightly wrapped as in Henley or Pirelli joints.

Standardisation.

There had, perhaps, been a greater diversity of opinion on the construction of joints for 33 000 V than those for lower voltages. Designs were now converging to a more or less standardised practice as a result of accumulated experience, for given types of cables which were now mostly the H.S.L. type, consisting of three separately lead covered cores laid up in triangular formation and armoured, and the H. type of cable—each core of which was lapped with a perforated metallised paper, the three cores being laid up and then lead covered. For the Pirelli oil-filled hollow conductor cable the jointing arrangements were very special.

Discussion.

THE BRANCH PRESIDENT (Mr. A. C. Sparks), referring to joints between generators and cable or between overhead lines and underground cables, where porcelain or some other form of insulator had to be used, emphasised that the method of bringing the conductor out through the insulator must be thought out very carefully. When the conductor heated up it lengthened slightly, and unless sufficient space was provided the compound was squeezed out. When the cable cooled down air containing moisture would enter.

MR. GROVER replied that expansion troubles had not been very great with three-core cables up to working pressures of 11 000 V. With the 33 000 V cables it was usual to adopt a trifurcating arrangement below ground. Modern designs made ample provision for expansion.

MR. LOCKWOOD asked for information with regard to expansion in straight joints, and whether there were on the market joints which would allow for the expansion of the lead as well as of the copper.

MR. GROVER said that when the cable was thoroughly impregnated the difficulty did not arise. If there were likely to be subsidence along a cable which might result in imposing excessive strain upon a joint, it was usual to lay the cable in a curve. If the cable were laid on a gradient, so that the pull was likely to be considerable, the anchoring of the cable or joint by different forms of earth anchors was effected.

MR. E. E. PICKETT asked if there were any objection to turning back the armouring over the glands. He had adopted that practice with the lower voltage cables below ground, because he had found that unless he did so the joints would pull out in the event of a fall of roof.

MR. GROVER said there was no objection to it electrically.

MR. ARTHUR E. DREW said it was gratifying, in this age of mechanisation, to note that the success of a joint depended still to a great extent upon the skill and experience of the jointer. It was not yet possible to find a compound which had not some volatile constituents. Probably, therefore, some better form of applying direct heat to the compound might be adopted. For many years there had been on the market domestic cooking utensils in which there was a steam jacket and a lightly loaded valve which slightly increased the steam pressure in the container and so increased the heat. Some form of graduated valve might be of assistance to the jointer, particularly the jointer in the colliery. Reference was made to an electrical soldering device, and one would have thought that that would have suggested an electrically heated vessel for heating the compound. Air pockets must be subjected to a great deal of pressure when the compound expanded. A good many cable joint failures might have been due to that cause.

MR. GROVER, replying, said that, with the march of progress, jointers and jointers' mates had to accommodate themselves to the new conditions. Most compounds for the 33 000-V cables were very carefully graded to give the best results. The suggestion to use a water-jacketed vessel for heating the compound was very useful, and certainly had possibilities. He believed that actually the complete equipment did make provision for electrically heating the compound. The air-jacketed vessel, although expensive, maintained its heat for a long time, and it gave good results. The breakdown strength of air followed a very definite law, with static pressure, and when a cable was hot there was a static pressure in it. The dielectric strength of the gaseous spaces was higher under those conditions than when the cable was cold, and for that reason there was a tendency for cable failures to occur when a cable was cold or cooling.

The next meeting of the London Branch is to be held jointly with the newly-formed Kent Sub-Branch, in Dover, on Saturday, March 1st.

INSTITUTION OF ELECTRICAL ENGINEERS.

The Annual Dinner—Nearly 700 Present—Sir Thomas Purves on the Policy of the Institution—Unity with Autonomy—Value of the Engineering Mind as a Corrective to Class Consciousness.

IT is inevitable in view of the rapid growth of electrical science and engineering that the annual dinner of the Institution of Electrical Engineers should be attended by larger numbers each year. On February 6th the attendance at the Hotel Cecil was in the neighbourhood of 700, and the ever-increasing size of the assemblage must be becoming a matter of some concern both to the Secretary and the Management of the restaurant. Applied electrical science by producing the microphone and the loud-speaker has or should have removed the difficulty of making oneself heard by all present regardless of the size of the hall—there were some complaints on this score at last week's dinner—but the problem of area is less susceptible of an electrical solution. One need not look very far ahead to foresee a time when Olympia or the Albert Hall will have to be requisitioned.

The Company.

Col. Sir Thomas Purves, president of the Institution, was in the chair, and those present included :—

The Rt. Hon. Lord Monk Bretton, C.B., D.L. (Chairman, London County Council); Mr. James Swinburne, F.R.S. (Past-President); Sir J. H. Jeans, D.Sc., LL.D., F.R.S.; Sir John Rose Bradford, K.C.M.G., C.B., C.B.E., M.D., F.R.S. (President, Royal College of Physicians); Capt. J. M. Donaldson, M.C. (Vice-President); Col. Sir Charles Close, K.B.E., C.B., C.M.G., F.R.S. (President, Royal Geographical Society); Mr. W. M. Mordey (Past-President); Sir G. Evelyn P. Murray, K.C.B. (Secretary, General Post Office); Mr. Ll. B. Atkinson (Past-President, I.E.E.; Chairman, Royal Society of Arts); Sir H. Haward (Vice-Chairman, Electricity Commission); The Hon. Sir C. A. Parsons, O.M., K.C.B., F.R.S. (Honorary Member); Mons. H. Parodi (President, Société Française des Electriciens); Mr. Roger T. Smith (Past-President); Mr. H. T. Tizard, C.B., F.R.S. (Rector, Imperial College of Science and Technology); Sir Archibald Page (Past-President); Mr. A. E. L. Chorlton, C.B.E. (Vice-President, Institution of Mechanical Engineers); Mr. J. K. Bridges (President, Incorporated Municipal Electrical Association); Dr. W. H. Eccles, F.R.S. (Past-President, I.E.E.; President, Institute of Physics; President, Physical Society of London); Dr. Herbert Levinstein (President, Society of Chemical Industry); Capt. J. F. C. Bennett, J.P. (Mayor of Westminster); Mr. W. Cullen, LL.D. (President, Institution of Mining and Metallurgy); Mr. M. F. G. Wilson (Chairman, British Engineering Standards Association); Mr. H. V. Ashley (Vice-President, Royal Institute of British Architects); Prof. J. F. Thorpe, C.B.E., D.Sc., F.R.S. (President, Chemical Society); Mr. W. B. Woodhouse (Past-President); Mr. V. Watlington, M.B.E. (Chairman, British Electrical and Allied Manufacturers' Association); Prof. T. M. Lowry, F.R.S. (President, Faraday Society); Sir David Milne-Wztson, LL.D., D..L. (President, Institute of Fuel); Dr. F. E. Smith, C.B., C.B.E., F.R.S. (Secretary, Department of Scientific and Industrial Research; Secretary, Royal Society); Dr. A. Russell, M.A., LL.D., F.R.S. (Past-President); Sir Walter Raine, J.P. (President, Association of British Chambers of Commerce), Sir Joseph E. Petavel, K.B.E., D.Sc., F.R.S. (Director, National Physical Laboratory); Mr. J. S. Highfield (Past-President); Sir G. W. Humphreys, K.B.E. (Vice-President, Institution of Civil Engineers); Sir Cyril W. Hurcomb, K.B.E., C.B. (Permanent Secretary, Ministry of Transport); Mr. C. P. Sparks, C.B.E. (Past-President); The Very Rev. W. Foxley Norris, C.V.O., M.A., D.D. (Dean of Westminster); Sir R. T. Glazebrook, K.C.B., D.Sc., F.R.S. (Past President); Mr. G. M. Gillett, M.P. (Secretary, Department of Overseas Trade); Sir J. R. Brooke, C.B. (Electricity Commissioner); Col. R. E. Crompton, C.B., R.E. (Past-President); Sir Ernest Rutherford, O.M., P.R.S. (President, Royal Society); Mr. T. E. Herbert; Sir Arnold Girdley, K.B.E.; Mr. T. Roles; Sir George Sutton; Col. A. P. Pyne, R.E.; the Earl of Bective; Col. J. F. Lister, C.M.G., T.D., R.E.; Lt.-Commdr. Haydn T. Harrison, R.N.V.R.; Mr. H. Marryat; Mr. T. W. Purse; Mr. B. A. Robinson; Lt.-Col. C. B. Clay; Dr. C. V. Drysdale; Major B. Binyon; Sir Ambrose Fleming, F.R.S.; Mr. D. N. Dunlop; Professor A. Fowler, F.R.S.; Lt.-Col. N. Harrison, C.M.G., D.S.O.; Mr. R. W. Weightman; Col. William Parker, D.S.O., T.D.; Brig-Gen. Magnus Mowat; Col. D. S. Collins, D.S.O.; Lt.-Col. F. A. C. Leigh, T.D.; Col. R. K. Morcom; Viscount Falmouth; Lt.-Col. K. Edgcumbe, T.D.; Lt.-Col. A. G. Lee, O.B.E., M.C.; Mr. E. H. Shaughnessy; Dr. A. H. Railing; Col. C. E. Thompson, D.S.O.; Col. H. E. Shreeve; Lt.-Col. A. Cortez-Leigh; Col. A. S. Angwin; Mr. C. H. Mery; Mr. L. J. Kettle; Mr. R. S. Whipple; Mr. J. M. Kennedy; Mr. A. R. Cooper; Mr. H. T. Young; Mr. F. S. G. Hinings; Mr. J. Harcourt Williams; Mr. B. Welbourn; Mr. C. C. Paterson; Mr. E. E. Sharp and Mr. R. A. Chattock.

Proposing the toast of "The Institution of Electrical Engineers," Sir J. H. Jeans said that if a visitor from another planet had come to the earth at intervals of a century since the Stone Age and had made reports on our habits all the earlier reports would be as nothing in comparison with that relating to the single century ending in 1930. The largest single item in the latest report would be Faraday's discovery of electro-magnetic induction 99 years ago. As late as 1870 no one had ever dreamed that electro-magnetic induction could have anything to do with telegraphy as then understood. Until 1880 electro-magnetism was looked after by purely scientific bodies. Human life had changed more in the last fifty years than in the entire previous period since the Stone Age. Electrical development had been almost entirely beneficial to the human race. The Institution had always kept in very close touch with pure science and it afforded the strongest argument when they were asked to justify expenditure on pure science. It was the breadth of view of an early electrical engineer which had forecast modern ideas as to the electrical constitution of matter. The president, Sir Thomas Purves, had himself shown the wide range of his thoughts in a recent address when he referred to a recent estimate as to the number of universes. He (Sir J. H. Jeans) found it very difficult to picture in imagination a single universe, but the president had talked glibly of 10^{177} universes as a conservative estimate, as de Sitter had mentioned 10^{183} as the possible number. If electrical science went on expanding at the same rate as during the past fifty or sixty years how much of electricity would our descendants know in the tens of thousands of millions of years that the earth was likely to last ?

Sir Thomas Purves, replying, said that the professional activities of some of the members were still rather mysterious to him. An expert had been defined as an ordinary man away from home, and Sir Oliver Lodge had said that experts in one's own line of business required to be placated rather than informed. The Institution existed in a field of very great diversity and one that was continually branching out. It had deliberately adopted the policy of standing for the whole of that field. They had felt that a profession based on electrical knowledge was capable of being directed as one profession, and would reap advantages from keeping together. They thought that the public good and professional *esprit de corps* would be better served in that way than by several different societies. The different sections enjoyed autonomy within themselves—a kind of Dominion status. The system was working well, and the organisation was sufficiently flexible. The main body of opinion favoured development on these lines. A comprehensive institution had an excellent mental and disciplinary effect on the members. There was no better training in citizenship than the resolution of conflicting interests in an organisation under the influence of loyalty to the organisation as a whole. Their policy was to offer the ægis of the Institution to any qualified body of workers in the electrical field that wished to act together in a wider sense than the interests of one particular firm. There was the difficulty that this sometimes involved a shedding of membership by the body entering the Institution. Relaxation of qualifications was quite out of the question—any change was likely to be in the opposite direction—but he was sure they would succeed in getting rid of this difficulty in some way, and so enable the Institution to cater for certain classes that now stood outside it.

Science the Spearhead.

The wonderful technical progress of the past thirty or forty years had been accompanied by a great widening of the intellectual horizon of the whole of mankind. Science was the spearhead of engineering and its only true guide. There was no greater need to-day than the inculcation of science in the education of mankind as a whole. There were great possibilities in substituting the intellectual drive of science and the engineering mind for the miserable class consciousness and class war which was now so characteristic of the nation. What was engineering but the optimum use of the best available means to secure the desired end ? What were Rutherford or Jeans but engineers ? So was every man with ideals for the future who had a true appreciation of ultimate values.

Captain J. M. Donaldson proposed the toast of "The

Digitized by Google

Guests," to which Sir John Brooke replied in a characteristic speech. He read a letter from the Postmaster-General, Mr H. B. Lees Smith, M.P., who was to have preceded Sir John Brooke in responding to the toast, apologising for his inability to be present owing to urgent business in the House of Commons. Mr. Lees Smith added that had he been present he would have expressed his appreciation of the high compliment paid by the election of Sir Thomas Purves as president, which was not only a compliment to Sir Thomas, but also to the Post Office which he served so well. The Post Office employed some 32 000 workers. Development in the past few years had permitted telephone subscribers to be put into touch with 90% of the telephone subscribers in the world. This forward push in recent years had been under the guidance of Sir Thomas Purves.

Continuing, Sir John Brooke said that he thought electricians had discovered certain secrets which they kept to themselves. Col. Crompton, at any rate, seemed to have discovered the secret of eternal youth, and Sir Archibald Page that of eternal work, not only for himself but for others too. Sir Thomas Purves had eulogised the engineering mind, but when he (Sir John Brooke) heard that Sir Thomas had tolerated a discrepancy of something of the order of 10^{10} in his estimate of the number of universes that seemed to him to be far beyond the limits of error that even Civil Servants permitted themselves. This explained how supplementary estimates arose. No body of men carried their responsibilities or their drinks more lightly than engineers. He had often had to rely on their courage, coolness and self-control, and had not found them wanting.

Many old friendships were renewed and new ones begun at the Reunion which followed.

ELECTRICAL RESEARCH ASSOCIATION.

Mr. Garcke's Presidential Address—Large Savings Already Effected by Work on Insulating Oils and Cable Heating—Principles of Cost Allocation—Danger of Research Getting too Far Ahead of Production.

At the luncheon following the ninth annual general meeting of the British Electrical and Allied Industries Research Association, held at the Savoy Restaurant on February 7th, Mr. Emil Garcke, president of the association, occupied the chair. Among those present were Sir Thomas Purves, Sir Richard Glazebrook, the Hon. Sir Charles A. Parsons, Colonel Crompton, Mr. P. J. Pybus, Lord Wargrave, Mr. W. B. Woodhouse, Sir J. R. Brooke, Sir B. Longbottom, Mr. Ll. B. Atkinson, Mr. C. H. Merz, Sir J. E. Petavel, Mr. R. W. Paul, Dr. F. E. Smith, and Lt.-Col. Cortez-Leigh.

Proposing the "E.R.A." Sir Thomas Purves said that fundamental research had quite definitely emerged from the condition in which it was something to be apologised for, and justified by balance sheets of a kind which were bound to leave many openings for criticism. Progress could no longer depend on the chance discoveries of science. The only way in which this country could hope to hold its own was by close fundamental research. The E.R.A. had done yeoman service in driving this lesson home. The only way to secure the necessary liaison between science and industry was for industry to reach upwards into the domains of science.

Mr. E. Garcke, replying, said that the E.R.A. was indebted in many respects to the I.E.E. and the B.E.A.M.A. and to many individual manufacturers and electricity supply companies. It was specially indebted to Sir Richard Glazebrook for the agreement that had been made between the different sections of the industry by which it was enabled to carry out the work immediately in view, also to Mr. Paul, the chairman of the Council and to Mr. Wedmore, the Director of Research.

There could be no doubt that the research work done by the Association, expressed only in terms of money, was of very considerable value. Research on insulating oils had cost about £8 500 in all, and had saved the industry at least £100 000 per annum. Researches on the heating of buried cables cost £18 500, and had saved at least £250 000, in addition to adding something like £4 000 000 to the duration value of existing cables.

Special research of benefit to only a few firms should be left to be carried out by them individually. The work of such associations as the E.R.A. should be of a kind capable of being valuable to a number of firms or to the industry collectively. The cost should be defrayed by the finished article rather than raw materials, as it was contrary to British principles of taxation to burden the initial or intermediate costs of production. It was difficult to allocate costs between people who received direct and indirect advantages from research work, but it was desirable to proceed along the present lines until wisdom came.

Collection of Funds.

The Association had made very encouraging progress in the collection of the necessary funds. This had enabled them to advance with confidence in the various stages of the work planned. Research could never end, and all organisations that were affected must still be asked to augment the financial resources of the Association. Invention was the instrument of creation as necessity was the mother of invention. We tried too often to make machines foolproof instead of trying to make ourselves competent in the use and management of machinery. Research which ran ahead and away from the common standard of utility and understanding was for the time being incongruous and inapplicable, and likely to remain fallow until work in other branches was able to come into line with it. Pioneers were necessary, but must not go so far ahead as to be out of touch with the forces they had to serve. During the last century the tendency was for research to lag behind production; now there was a tendency for research to go too far ahead. The application of pure science to practical purposes depended very largely on the environment.

His belief, based on long experience, was that the character of the worker was all right, but the system under which he was educated and working was in a large measure all wrong. The working classes were badly treated in the nineteenth century. They had an inherited suspicion of employers. The whole industrial situation called for a fresh mind and an unflinching spirit to go fully into co-operation and elaborate co-partnership. Trade unions and employers' organisation might be invited to lend valuable services to industry by co-operating with managements. We needed better direction. We were not now suffering from lack of research in most departments Some 70 research committees had been appointed to investigate problems and many other organisations were dealing with research. There were many more ideas and potential improvements to develop in the practical sense than we could tackle with the capital and resources at our command.

There was too much inclination on the part of directors when business was good and suggestions were made for the adoption of new methods and plans to say: "Why not leave well alone?" In times of adversity they thought they showed wisdom by saying: "This is not the time to spend capital on improvements."

Mr. R. W. Paul proposed the health of the chairman, who, he said, was a worthy successor to a line of worthy presidents.

STREET TRACTION VEHICLES.

Advantages and Limitations of Different Types.

Mr. R. H. WILKINSON read a paper before the Institute of Transport on Monday—it is to be repeated before the Leeds and District Section on February 28th—on the "Advantages and Limitations of the Tramcar, Railless Vehicle and Motor Bus." He gave figures of the operating and overhead costs of the three types of vehicles which indicated that the trolley vehicle was the most economical for dealing with all services up to 18 minutes' frequency, after which the motor bus became the most economical.

"In the trolley vehicle," said Mr. Wilkinson, "tramway authorities, particularly those whose rails meet but are unable to inter-run owing to differences of track gauge, have a traffic instrument in their hands that is capable of giving the most efficient and economical service between towns and on which they could have protective fares. Licenses have been granted to bus operators on account of the break in the service at the tramway termini, which might have been avoided if a through service of vehicles had existed, and the trolley vehicle can provide this. If an express service should be required in addition the motor bus would be employed for this specific purpose."

THE BRITISH INDUSTRIES FAIR.

Arrangements for Official Visits to the Electrical Section of the Fair at Castle Bromwich—Plan of the Main Portion of the Electrical Section—Names and Stand Numbers of Exhibitors.

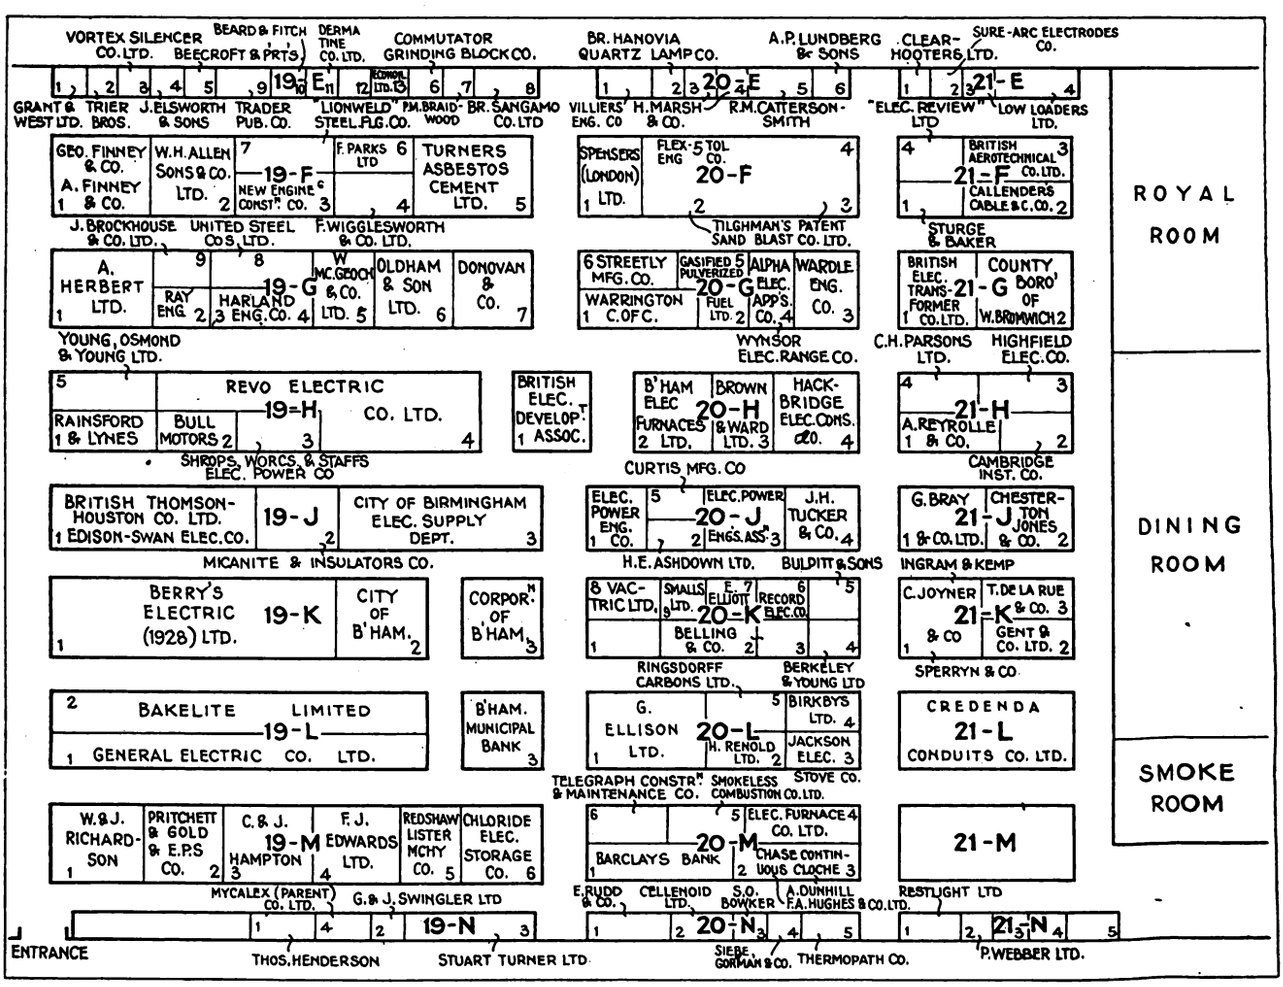
AS in previous years, arrangements have been made for a number of official visits to the electrical section of the British Industries Fair, which opens at Castle Bromwich, Birmingham, on Monday, and will continue until February 28th. On February 20th a luncheon will be attended by members of the Institution of Electrical Engineers, the Incorporated Municipal Electrical Association, the British Electrical Development Association, the Incorporated Association of Electric Power Companies, the Provincial Electric Supply Association, the Municipal Tramways and Transport Association, and the Tramways and Light Railways Association.

A luncheon to the Electrical Power Engineers' Association will be held on February 22nd, with a conference in the afternoon. The Students' Section of the South Midland Centre of the Institution of Electrical Engineers will be entertained at tea during the afternoon.

On February 27th a luncheon will be attended by members of the South Midland Centre of the Institution of Electrical Engineers, the Association of Consulting Engineers, the Association of Supervising Electrical Engineers, the Electrical Contractors' Association, the Electrical Contractors' Association of Scotland, the Electrical Wholesalers' Federation, Ltd., the Electrical Merchants' and Manufacturers' Association, the Association of Mining Electrical Engineers, the Incorporated Municipal Electrical Association, and the Illuminating Engineering Society. A conference of members of the Electrical Contractors' Association and Electrical Wholesalers' Federation will be held in the morning. During the afternoon the Birmingham and Midland Branch of the Electrical Association for Women will be entertained at tea.

Our first review of the Birmingham section of the Fair will be found on page 200, together with a number of illustrations of equipment which has not been shown before or which is of outstanding interest.

On account of the size of the Fair it has not been possible to include descriptions of the whole of the exhibits in one issue, and it is with pleasure that we are able to give this week details of some of the stands as the result of co-operation with the exhibitors themselves and from information supplied by the organisers of the exhibition. A further review will appear in our next issue.



PLAN of the main portion of the electrical section of the British Industries Fair, at Castle Bromwich, Birmingham, showing the stand numbers and names of exhibitors. A complete list of firms exhibiting items of electrical interest at Castle Bromwich but whose stands are not necessarily in the electrical section is given on the opposite page.

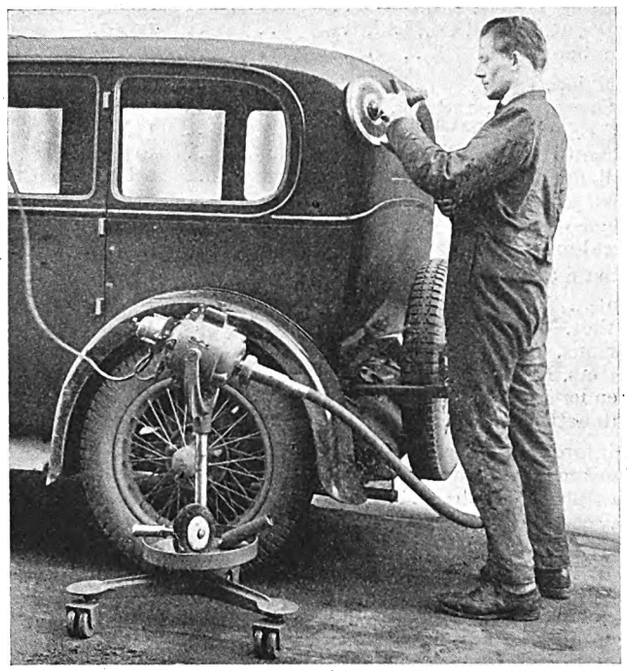
SOME OF THE EXHIBITS AT THE FAIR.

Industrial Electrical Equipment to be seen at Castle Bromwich—Machine Tools and Other Apparatus for Works and Factories.

WE commence below the first of our reviews of the British Industries Fair, dealing this week with some of the industrial exhibits at Castle Bromwich. The descriptions are necessarily brief on account of space, but should readers desire further particulars the names and addresses of exhibitors are given.

The CURTIS MANUFACTURING CO., LTD. (32, Spring Street, London, W.1), is showing a wide variety of articles in resistance



Sanding car bodies with the equipment shown by F. Gilman (B.S.T.) Ltd.

apparatus. Amongst these is the new ball slide, which eliminates the no small disadvantage of friction on the slide rod with the use of a slider resistance. These slider dimmers are used for a wide variety of purposes, the chief being for lighting effects, and it may be of interest to know that every performance of "Journey's End," in which the lighting effects illustrate the action of gun-fire and Verey lights, involves the use of these dimmers to bring about the desired effects. Other articles are new designs of dead front cinema control boards, showing the duplex dissolving resistance, by which a predetermined current from the motor generator cannot be exceeded, and which also allows dissolving effects from one arc to the other. There is also a testing board, giving very fine regulation over wide ranges of current, for meter testing. Sliding resistances of various sizes, together with some of extra large pattern, such as are used as power regulators on board ship are also exhibited. Arc welding resistances, regulating current in apparatus resistances, and a number of interesting small articles embracing resistances as their basis are also shown.

The HORSTMANN GEAR CO., LTD. (Newbridge Works, Bath). On this stand is shown a representative range of Newbridge time switches from 1·5 to 50 A for street lighting, shop window lighting, two-rate meter control, etc., including a neat unit lighting time switch, styled type "T" of 2.5 amp. capacity, as illustrated, is on view. Newbridge time switches are British made, save the Swiss escapement, at the firm's own works at Bath.

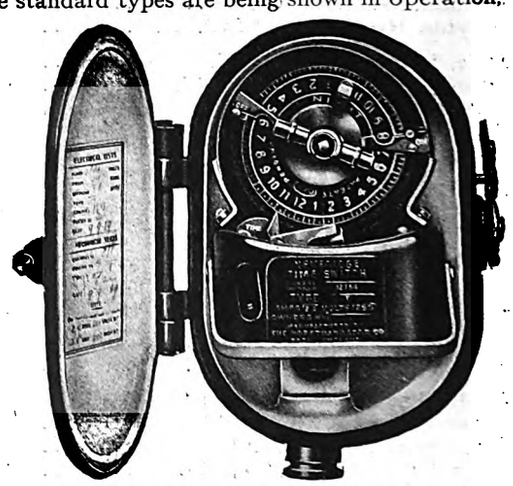
The AERASPRAY MANUFACTURING CO., LTD. (122/3, Livery Street, Birmingham). The careful attention paid to tools by modern designers is well illustrated in "Aerospray" guns, which are made entirely of duralumin with threadless stainless steel nozzles and needles. The weight of the fastest gun made by this company, the "Fanex" type, is under 13 oz. without the colour container or alternative pressure feed connection. Considerable care has also been devoted to the design of the trigger action in order to prevent finger tiredness or cramp, which is liable to occur where girl labour is employed. The compressors made by this firm are also of interest. The revolving and reciprocating parts are counterweighted and balanced both statically and dynamically. Even the smallest machine is fitted with forced lubrication and other features common to the entire range of compressors are, combined hand unloader for starting up with the air receiver under pressure and automatic unloader whereby the machine stops compressing when the guns are not using air. Another interesting item of spraying equipment made by this firm is the "self-scavenging" air purifier. This improved apparatus incorporates a "stationary scrubber," and is unconditionally guaranteed to be completely satisfactory under the most severe conditions. See page 203.

C. C. WAKEFIELD AND CO., LTD. (30/32, Cheapside, London, E.C.2), are showing specialised lubricants for all types of plant, also cutting and quenching oils. Wakefield lubricating appliances are prominent, and include all the well known patterns of mechanical lubricators for application to stationary plant, locos., etc., grease guns for machine tools, etc., and lubricators for pneumatic tools. A notable feature is the mechanical lubricator, especially designed for operation with machine and similar tools.

Messrs. E. ELLIOTT (126/8, Brearley Street, Birmingham), are showing in the Electrical Section of the Fair, mainly as manufacturers of bakelite electrical parts for the trade. They are not exhibiting articles to sell direct to contractors, as the bulk of their business is done in moulding for manufacturers articles of their own design and special registered patterns. In the background of the stand is shown a range of fancy articles made of "Birmite."

G. A. HARVEY AND CO. (LONDON), LTD. (Woolwich Road, London, S.E.7). The exhibits shown by this company will attract the engineer and those entrusted with the management of plant and equipment. Of particular interest is the array of perforated metals and woven wire in a wide variety of patterns. Many designs of ornamental metalwork for radiator and electric-heater covers, grilles and ventilator panels are shown. A large part of the company's output consists of steel plate work and constructional work, and amongst the many diverse forms of industrial equipment they produce are storage vessels, stills, condensers, cylinders, etc. Specimens of flanged steel plates up to $\frac{5}{8}$ in. thick, as well as angle sections, bent or rolled to various sizes, form an important part of this exhibit. A header of gilled tubes for transformer tanks will be of especial interest to electrical engineers.

J. B. STONE AND CO., LTD. (135, Finsbury Pavement, London, E.C.2), are showing their well-known nibbling machines. The standard types are being shown in operation, cutting sheet metal from $\frac{1}{8}$ in. to $\frac{5}{16}$ in. thick. The smallest machine is intended primarily as a bench machine for use when cutting thin stock up to 14 gauge. The principle of operation, viz., the punch and the die, is the same as in the larger machines. It is specially adapted to small work such as trimming embossed work, duplicating small parts, templet making, small stencil or sign cutting, etc. The rapid cutting speed, which is approximately 60 in. per min., makes it an ideal machine for these types of work. This small nibbler is geared directly to a motor supplied with the machine, and



The "Newbridge" time switch. (The Horstmann Gear Co., Ltd.

can be moved from the bench to any convenient position and then operated from an ordinary lamp socket.

The Zinc Alloy Rust-Proofing Co., Ltd. (Shakespeare Street, Wolverhampton), are again making a limited display of Sherardized products. Technical information required about the process can be obtained on the stand, and those interested in the rust-proofing of any particular product will be informed where, if possible, that product can be seen Sherardized on other stands at the exhibition. A full list of the various firms exhibiting Sherardized products will also be available.

The Gutta Percha Co. (Wharf Road, London, N.1), is again displaying high grade alloys with special magnetic and electrical qualities. By continued research into methods of production, the company claims to be able to offer alloys which are, mechanically and electrically, considerably improved in quality on last year's products. This is illustrated by the increased width of strip available in thin gauges, and improved deep stamping qualities, while the magnetic standard of the alloys has been raised and stabilised by the collection of more exact evidence on heat treatment effects. Mumetal, the high permeability, low hysteresis alloy, primarily produced for continuous submarine cable loading, is now largely employed for improved current transformers, and finds considerable application in the radio industry. It is available as bright rolled strip in all standard thicknesses, and also as ring stampings, as exhibited. To illustrate the advance that has been made in Mumetal, the company have produced test samples with an initial permeability of 19 000 and a maximum permeability of 130 000. Radiometal is another alloy which is finding general acceptance for audio frequency transformer cores, owing to its high and constant incremental permeability. This metal is exhibited in standard strip and sheet sizes, and as stampings. Pyromic, high resistivity, heat resisting alloys are also shown as castings, forgings, strip and wire.

The British Thomson-Houston Co., Ltd. (Rugby), are showing on that portion of the stand which is devoted to industrial equipment, many exhibits including standard motors for a.c. and d.c. circuits, the sizes ranging from fractional horse-power to larger ratings, as well as the newer " built-in " motors, and worm-geared motor units. For use on single-phase a.c. circuits there is also a repulsion induction motor, designed to start up easily under heavy load and to run at high power factor at a constant speed. Other industrial exhibits consist of motor generators and " Fabrioil " pinions. Among the many benefits that the machine tool industry has derived from the activities of this company, one of the most recent is the introduction of the " built-in " motors for giving direct drive to machine tools and woodworking machinery. These are complete as regards the essential electrical and magnetic portions of a three-phase a.c. motor. The stator unit consists of a core and winding in an enclosing shell, and the rotor unit a squirrel-cage rotor with centrifugally cast aluminium bars and end rings. The units are assembled by the machine tool makers and housed in frames which are designed as an integral part of the machine tool, and the machine tool makers also provide shaft, end-shields and bearings as part of their design. For certain machine tools, " vertical spindle " motors can be applied as horizontal end-shield mounted machines, the driving end-shield being bolted to a vertical surface so that the motor is overhung with the shaft horizontal. An entirely new line of worm-geared motor units is also represented. These units, with the motor mounted integral with a worm reducing gear, are shown in two forms—vertical and horizontal. The vertical arrangement is preferable where sufficient head room is available, but where this is limited, the horizontal unit offers an alternative arrangement. Permanent accuracy of alignment, together with minimum weight and space is achieved by these equipments, and the elimination of a bedplate avoids a frequent cause of trouble due to bedplate springing. These geared units form a very efficient drive and give high efficiencies over a wide range of ratios, 7½–1 to 30–1 ratios are standardised, but greater reductions can also be supplied.

Birmingham Electric Furnaces, Ltd., (55, George Street, Parade, Birmingham). A full scale half section of a large " Birlec " furnace, which illustrates the robust method of construction, and the company's special patented heating element employed, are included in the exhibits. Owing to its size, it is impossible to show a furnace of this type in operation at an exhibition, therefore, photographs of some large installations are shown, including furnaces for annealing and general heat treatment of steel and non-ferrous metals, bright annealing, carburising, hardening, etc. All these installations are in commercial operation, and full particulars including operating costs can be obtained. Among the illustrations on page 205 is a picture of a large box type " Birlec " furnace, having a usable hearth 9 ft. long by 5 ft. wide, and a maximum rating of approximately 180 kW, arranged for mechanical charging and used for carburising. A " Birlec " electrically-driven charging machine is shown in the foreground. Two standard portable " Birlec " furnaces of an entirely new range are also shown on the stand, both being in operation. The smaller one—which has a hearth 30 in. long by 15 in. wide and a maximum rating of approximately 18 kW—is shown re-heating steel parts previous to oil quenching, and the larger model, with a hearth 36 in. long by 23 in. wide and a maximum rating of approximately 30 kW, is carburising. Two furnaces similar to the larger model are illustrated on page 205. Whilst both models exhibited are similar in outward appearance to those shown by this firm at the Fair last year, the outstanding difference of this new series (which is in addition to, and does not supplant the previous series) is in the design of the heating elements which is now similar to that employed with success in the larger installations. The system consists of supporting the resistor, which is of heavy nickel-chromium strip bent into zig-zag form on heavy gauge hooks of the same metal. In this way there is no contact between the element and the refractory, and all risks of " hot spots," due to masking or of any interaction between the elements and the lining, are eliminated, with a consequent increase of resistor life. The supports are placed at such frequent intervals that with the

Digitized by Google

heavy gauge of strip employed no sagging or distortion of the elements can take place.

The RAWLPLUG Co., LTD. (Rawlplug House, Cromwell Road, London, S.W.7), is showing, in addition to the well-known Rawlplugs and bolt anchors, the new Kango hammer and flexible steel rule. With regard to the hammer, this is a heavy duty type electrically-operated tool, fitted with a totally enclosed motor and having a total weight of 14½ lb. The tool is made for all standard voltages and a variety of tool fittings such as chisels, points, chasing tools, etc., are available.

The EXECUTORS OF JAMES MILLS, LTD. (Bredbury Steel Works and Rolling Mills, Stockport), are making a special exhibit of grooved pins and studs largely used throughout the electrical industry.

The ELECTRIC FURNACE Co., LTD., and its newly-formed subsidiary company, the ELECTRIC RESISTANCE FURNACE Co., LTD., both of 17, Victoria Street, London, S.W.1, have staged a joint exhibit. The Electric Furnace Co. deals with electric melting furnaces of all types, such as the Héroult arc furnace, the Ajax-Wyatt induction furnace, the Ajax-Northrup high frequency furnace, etc. There is in operation a small Ajax-Northrup high-frequency furnace suitable for use in laboratories, and this illustrates the principle of high frequency melting. A new type of poking machine, which is used for stirring brass swarf in Ajax-Wyatt furnaces, is also shown. This machine claims to reduce labour costs, power consumption, and increase the number of heats produced in a given time by over 20%. Owing to the fact that a plant of the furnace type is too large to be shown at an exhibition, demonstration can be seen at 360, Farm Street, Birmingham. A melting pot heated by electric resistors, which is suitable for aluminium, lead and other metals of low melting point, is another exhibit, and the pot shown has a capacity of about 200 lb. of aluminium. These pots can be made in sizes varying from 20 lb. up to 5 tons. An air heater, suitable for supplying hot air for drying purposes of all kinds, such as tea, rubber latex, cores, etc., is also to be seen, the heater shown being of simple construction and of 3·4 kW rating. A number of electric furnace products are also being shown, including intricate castings of steel made in an Ajax-Northrup high frequency furnace, pottery decorated in an Efco kiln, etc.

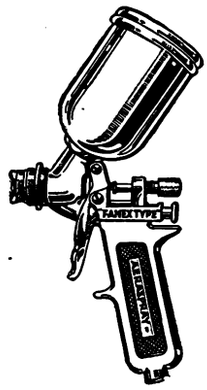
PARKER, WINDER AND ACHURCH, LTD., (Broad Street, Birmingham). New products formally displayed for the first time include Parwinac "Empire" oil burners and Sklenar's midget furnace with Parwinac industrial oil burners, the most important features of which, from the electrical point of view, are the controls.

BRITISH ELECTRICAL REPAIRS, LTD. (72, Bennett Street, Manchester), are not this year exhibiting any new electrical apparatus, but since the company has established works in various parts of the country, each built and equipped for the sole purpose of carrying out repairs to electrical apparatus, and since each works has vacuum and pressure impregnation plants installed, together with testing equipment, it claims to be the largest organisation of its kind in the British Isles, and is showing at the Fair photographs of the various works. Other exhibits comprise various types of armature, rotor, stator and field coils, shafts, commutators, bearings and all specimens of standard and special insulation.

W. AND C. PANTIN (147, Upper Thames Street, London, E.C.4) are exhibiting an installation of conveyors consisting of an inclined drag-type elevator for raising boxes, gravity roller conveyor for conveying them, and a patent inclined belt lowerator for lowering them; also a machine for wire tying boxes.

Scaling Tools.

F. GILMAN (B.S.T.), LTD. (221, High Street, Smethwick), are exhibiting a full range of scaling tools for every type of tube scaling work from ⅝ in. condenser tubes upwards, including machines and plants for dealing with evaporators, multi-tubular boilers of the Yarrow type, Clarke-Chapman type, Babcock and Wilcox type, Stirling type, Thompson type, as well as machines for economisers of every make, and special plant for scaling Lancashire boilers. In addition, machines are shown for dealing with copper tubes, for cleaning moulds, for fettling and trimming castings, for tank cleaning purposes, as well as for rust and paint removing, and other similar work. An entirely new type of machine is shown for the first time for use particularly by the motor trades. The set is an electrical plant fitted with a motor of ½ H.P. mounted in a swivel bracket, allowing both lateral as well as vertical movement. The drive from the motor is by means of flexible shafting running in a steel reinforced rubber outer covering. Various working heads can be attached to the flexible drive, and the machine will carry out such work as drilling, grinding, etc. It can be also used for sanding car bodies before painting or cellulosing, as well as for polishing and finishing off the paint or cellulose after it has been applied. Special sanding and rubbing down pads are provided for this work. Similar heads, but of cone shape, can be provided for getting into positions where the flat sanding heads cannot be applied. Wire brushes are also used with this machine for cleaning inside the mud-guards along the foot-boards, and for working into other awkward positions. The machine can be provided with wire brushes for decarbonising, and can further be used in conjunction with rotary rasps for repairing tyres, for rasping out cuts and bad patches, prior to vulcanising. The standard machine has a single spindle drive at 2 800 r.p.m., but a gear-box attachment can also be used with the motor, giving three separate drives at different speeds. In addition to the ½ H.P. plant, a second machine is marketed embodying a 1½ H.P. driving motor. The uses and details of this machine are generally the same as those already given for the ½ H.P. equipment.



The paint sprayer shown by the Aeraspray Manufacturing Co., Ltd.

BAKELITE, LTD. (68, Victoria Street, London, S.W.1) are showing both in Birmingham and London, each stand embodying bakelite laminated panels with wood-grain finishes for the walls, thus giving a practical demonstration of this new material. The display at the Birmingham Section is an exceptionally comprehensive one, showing applications of all bakelite products in many industries. At London the display deals particularly with the applications of bakelite products in the radio industry. For the first time a display of mouldings made from the new bakelite white moulding material is on view, these being particularly suitable as electric light fittings for bathrooms, etc.

TURNER'S ASBESTOS CEMENT, LTD. (Trafford Park, Manchester). This stand is again occupied by asbestos electrical insulating and arc-resisting materials manufactured and sold under the trade name "Sindanyo," but another interesting feature of the exhibition this year is that, following on the amalgamations in the asbestos industry during the past year, other familiar products appearing on this stand are "Siluminite," "Ebbinita," and "Uacolite. An important feature consists of a variety of "Sindanyo" switchboard panels fitted with electrical equipment. The infinite variety of shaped parts produced in "Sindanyo" is also shown to advantage. Asbestos paper for electrolytic work, asbestos paper tape for cable insulation and asbestos paper tubes, are displayed on this stand, together with a comprehensive grouping of insulating mouldings of "Siluminite" and "Ebbinita," products hitherto sold by the Siluminite Insulator Co., Ltd., in addition to a selection of "Uacolite" sheets and mouldings formerly sold by Bell's United Asbestos Co., Ltd.

The ELLMAR MOULDING Co. (Thimble Mill Lane, Birmingham). Here is shown a comprehensive exhibit of bakelite mouldings, specially suitable for the manufacture of wireless parts, magneto fittings, motor cycle and motor car accessories, general, electrical, insulating parts, etc.

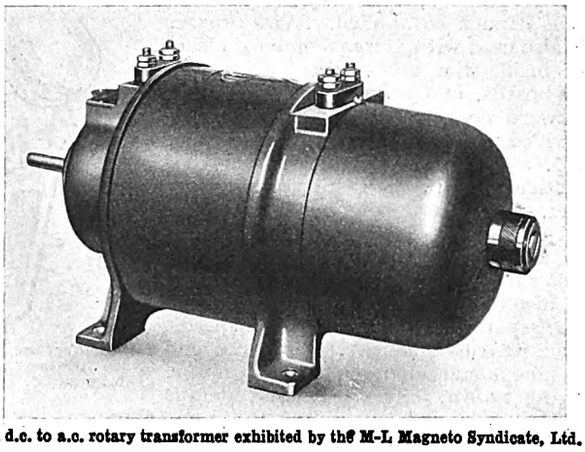
SERCK TUBES, LTD. (Warwick Road, Greet, Birmingham), are showing thermostatic control of electric currents at any distance. This apparatus is intended to control directly the switch gear at a pre-determined temperature. Its power is obtained by the rise or fall in temperature of a hollow vessel; this force is conveyed any distance to the operating mechanism by a small diameter tube, the movement so set up can be of the usual thermostatic rate, so much power per degree rise, or if desired can be made to operate with a snap action. Another exhibit is a snap action thermostatic device, which prevents any movement until the pre-determined temperature is reached in rise and also fall, and is particularly useful in domestic and hot water appliances, such as kettles, hot water systems, etc.

ACCLES AND POLLOCK, LTD. (Oldbury, Birmingham), are displaying every type and quality of weldless steel tube. A year or two ago Accles and Pollock claimed to have introduced chrome molybdenum steel into this country for aircraft tube work, and it has been adopted by many firms in that industry. Many other uses have now been found for this

Digitized by Google

material, and examples of its application may be seen on the stand.

Earle, Bourne and Co., Ltd. (Birmingham Rolling and Tube Mills, Heath Street South, Birmingham), have on view a comprehensive range of manufactures, including cold rolled brass of various alloys, and copper; solid drawn brass and copper tubes for condensers, etc.; brazed brass and copper tubes, plain, ornamental, round, square, oval, flat, twisted and reeded. Light copper tubes and fittings for domestic water services and a selection of tubes, metal and step-edging chromium plated, are also included.



A d.c. to a.c. rotary transformer exhibited by the M-L Magneto Syndicate, Ltd.

The Bromford Tube Co., Ltd. (Birmingham). Here is exhibited the new seamless steel lighting standards with fluted colums, both spiral and vertical. The claims made for these are: (1) made from special quality seamless steel; (2) high tensile strength; (3) freedom from structural weaknesses such as blowholes, cracks, etc.; (4) lighter in weight than cast iron, therefore easier to handle and cheaper to transport; (5) are not brittle; (6) if bent, can be re-straightened and put into use again. For electric lighting a new type of box has been designed which encloses the time switches and fuses and also combines the cable sealing boxes. This box is so designed that the enclosed apparatus is very nearly flush with the lines of the standard, but still easily accessible. Other exhibits include tram and transmission poles.

The Drayton Regulator and Instrument Co., Ltd. (West Drayton, Middlesex), are exhibiting a range of switches and contact devices operated by temperature, humidity, pressure and level impulses. A number of new patterns have been standardised over the last twelve months and are exhibited for the first time. A particularly interesting item is the H.C. humidity contactor, which actuates relay switches on valves through a three wire circuit. The contact arm is actuated by the deviation from a set wet-bulb depression. The H.C. contactor can be applied to the control of humidity in automatic sub-stations, work-rooms, stores and air conditioning generally. The R.C. temperature contactor operates in the same way, the contact arm being actuated by a bi-metal thermostatic coil.

Clear Hooters, Ltd. (79–81, Lombard Street, Birmingham), are again featuring their electrically operated sirens and hooters, a special feature being a new high frequency "Clarion" electric horn.

Henry Wiggin and Co., Ltd. (Wiggin Street, Birmingham), are showing examples of the uses of "Silveroid," together with photographs of the equipment, in addition to a number of electric fires of various makes with "Brightray" elements, a range of sample reels of "Brightray" and "Glowray," both nickel chromium resistance materials, "Ferry" for motor startors, etc. Various small resistances and rheostats are also exhibited. There are also photographs of heavy electrical equipment using the company's resistance materials.

S. G. Brown, Ltd. (Western Avenue, North Acton, London, W.3). The exhibits here include the "Brown" electric megaphone for use where a loud speaking telephone is required, and it is interesting to note that these instruments are used in large numbers by the navies of the world, and the mercantile marine. The amplification obtained with the instrument is said to be some three times the normal voice; articulation is distinct, and "howling" absent. It is water-tight and the instruments are doubly protected against climatic conditions. As many as six receivers can be operated from one transmitter without loss of volume, or any increase in current consumption. Extraneous noises are eliminated from the transmission by the Brown's patent differential anti-howling microphone. Thus, side-tone cannot occur. Speech can be transmitted over ten miles of line without appreciable loss of volume. The supply to the transmitter can be from either a.c. or d.c. mains, or from storage batteries, the working voltage being 12 V.

Oldham and Sons, Ltd. (Denton). This exhibit is representative of all three branches of the firm's activities under the following headings: (1) Storage battery manufacture; (2) mining specialities; and (3) hatting machinery. In the battery section may be seen specimens of low tension accumulators in glass and celluloid including the range of slow discharge cells with laminode plates, and a full range of unspillable accumulators for use with portable wireless receivers. Air-spaced high tension accumulators, which can be assembled on the expanding bookcase principle, are shown together with examples of h.t. and l.t. auto-power units and h.t. battery chargers, all of which are fitted with Westinghouse dry metal rectifiers. In the Mining Section there are electric safety lamps, together with lamp-room equipment for cleaning, charging and maintaining an efficient lamp service at the colliery.

Herbert Terry and Sons, Ltd. (Redditch), are again displaying every form of press work of interest to the electrical industry.

Messrs. H. C. Slingsby (Kingsway, London, W.C.2) are featuring their well known trucks, handcarts, etc., all of which are so well known and used in the electrical industry as to warrant no further description. Electric trucks include load-carrying trucks; elevating platform trucks for loads up to 2 tons; lifting-tiering trucks up to 75 in. for loads up to 2 tons; trackless-tractor-trailer-truck trains; industrial engines, trackless and for railways.

Ringsdorff Carbons (England), Ltd. (Colindale Avenue, Hendon, London, N.W.9), display carbon brushes for slip rings and commutators of electric motors and generators; brushes for heavy switch gear; for rotary convertors, turbo-generators, railway and tramway motors; automobile brushes for startors and lighting sets; carbon contacts; carbon discs; carbon rings, plates and rods. A new exhibit is an "R.B." spring steel flexible connection for carbon brushes.

W. Canning and Co., Ltd. (133–137, Gt. Hampton Street, Birmingham). The exhibits here include a range of "Canning" low voltage dynamos and motor generators, especially designed for electro-deposition. Resistance boards; control panels; shunt regulators; voltmeters; ammeters, and other electrical instruments for electro-deposition, are also to be seen. In addition, examples of plating barrels, a lacquer spraying cabinet, and a large collection of plating, polishing and finishing materials are included, embracing chemicals, compositions, brushes, wheels, bobs, felts, mops, and bronzing and lacquering supplies.

The City of Birmingham Electric Supply Department is displaying electric power equipment with a range of portable tools; electric paint burners and branding irons, drills, grinders, mops, etc.; small electrical furnaces and welders; industrial heating apparatus; oven and cooking apparatus suitable for canteens, cafés, etc.; water heating apparatus, industrial lighting fittings, etc.

Lifting Magnets.

The Rapid Magnetting Machine Co., Ltd. (Magnet Works, Lombard Street, Birmingham). This exhibit comprises five examples of magnetic drum and pulley type separators, two types of chute separators, a representative magnetic clutch, two types electro-lifting magnets of gantry with hoist blocks, and a spring cable drum, a foundry sand separating and sieving plant, and a sundry small magnetic apparatus. Some of the exhibits are at work. The high intensity "Waterfall" chute type separator has not been exhibited before, and is of an improved type with stepped trough surface. The coil windings are connected with the control switchgear in such a way that in the event of intentional or accidental current interruption, not only does a collapsible bridge turn and divert the released accumulated iron, but also a mechanically coupled feed door turns and stops the flow, and when accidental stoppage occurs an alarm bell rings. The apparatus is suitable to treat powders, granular materials, and products, coal before pulverising, etc. With regard to the foundry sand plant this is another new exhibit and the plant on the stand is electric motor driven. This equipment combines a hopper fed short conveyor-type magnetic-pulley separator

(Continued on page 206.)

SOME INDUSTRIAL EXHIBITS.

AMONG the exhibits of W. Canning and Co., Ltd., are special dynamos used for electro-deposition, incorporating the brush spindles shown in (1), *a 250 A. generator coupled to a 5 h.p. d.c. motor is seen in* (2), *while detailed views of the brush holder and improved spindle are given in* (3) *and* (8). *The Birmingham Electric Furnaces, Ltd., are displaying the 30 in. by 15 in. model H.C.P.2 illustrated in* (4), *portable furnaces of the same make and a large "Birlec" machine being illustrated in* (5) *and* (7). *The nibbling machine of J. B. Stone and Co. is shown in* (6).

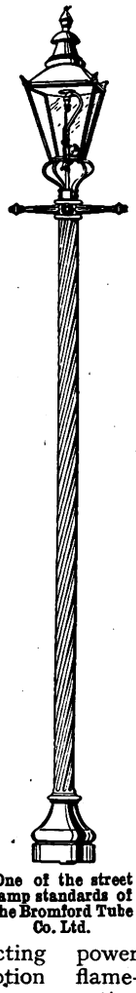
D

Digitized by Google

with a mechanically jig shaken sieve, removing the iron from the foundry sand and sifting out all oversize and foreign material, rendering it fit for re-use. Several designs and sizes of plant are standardised of capacities from one ton per hour to ten tons per hour or more.

The GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2). This stand is sectionalised and so far as industrial equipment is concerned this is seen in the left-hand section. The chief features are a standard Magnet type electric furnace actually annealing brass stampings, spinnings, etc. Two other electric furnaces are also shown near it—viz., a muffle furnace and a high temperature steel hardening furnace—the former serving to pre-heat high speed steel tools before they go into the hardening furnace. At the other wing of the stand another Magnet type electric furnace, designed for annealing steel and case-hardening steel is shown in operation. Adjacent to this is a lead melting pot with its contents molten, and an electric still, while at the rear will be seen an electric cyanide pot (the last-named cannot, of course, be shown in operation, owing to the fumes which would be given off). On this same section is also shown a sectional model of the Grunewald electric bright annealing plant, for steel and copper strip and wire in coils—samples which have been bright annealed are displayed on the stand. The exhibitors point out that the efficiency of the Grunewald process, for which the G.E.C. have the sole manufacturing and selling rights for the British Empire, should make this exhibit one of the outstanding features at the Fair. The remainder of the exhibits on this stand will be dealt with in our next issue.

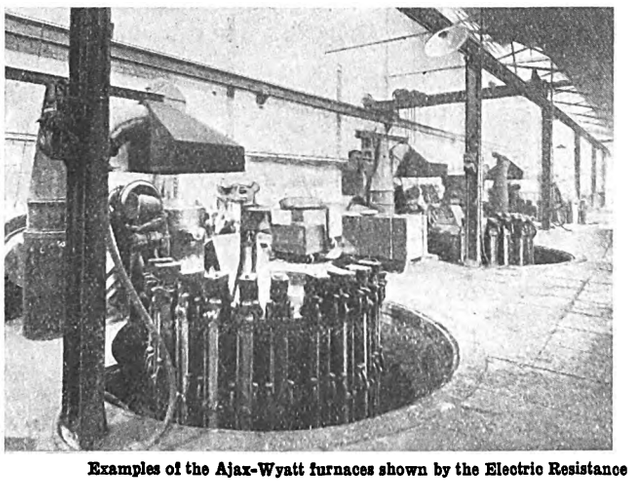
The CAMBRIDGE INSTRUMENT CO., LTD. (45, Grosvenor Place, London, S.W.1) Among the new instruments shown here is an a.c. microammeter (incorporating Westinghouse metal rectifiers). The construction of these instruments enables the sensitive moving coil galvanometer to be adapted for the measurement of a.c. down to a few microamperes. Another advantage is that the torque weight ratio is smaller than for a moving-iron instrument, with the result that the deflecting forces need only be small and hence the power consumption is reduced to a minimum. Two types of microammeter are made, in various patterns. The lower range patterns are self-contained instruments consisting of a type L unipivot galvanometer with a moving coil having a resistance of 250 ohms, and giving full scale deflection for 50 microamperes, together with a Westinghouse copper-oxide full wave rectifier unit contained within the instrument case. This type is made in two ranges only, from 0 to 100, and from 0 to 200 microamperes respectively, and cannot be used with range multipliers. In these lower ranges, the scales does not completely follow the linear law, the lowest 7% of the scale being rather less open than the rest. Each instrument is calibrated for use with its particular rectifier. The higher range patterns consist of a type L unipivot galvanometer with coil of 10 ohms resistance, and a separate rectifier unit, enabling the galvanometer to be calibrated for ranges to 500, 1 000 or 2 000 microamperes. The rectifier units covering these ranges are fitted with tags for attachment to the "thermal" terminals of a four-terminal galvanometer which may be used for a.c. or d.c. measurements. The calibration of the low-range instruments is accurate to within 1% at full scale, and 2% at half scale reading between the temperature limits of 10 deg. and 23 deg. C. For the higher ranges the calibration is accurate to within 1% of full scale reading and is independent of temperature. These accuracies refer to a supply of sinusoidal waveform. The calibration of these instruments is independent of frequency up to 2 000 cycles per second. They are accurate to within 1% at 4 000 cycles per second and 2% at 6 000 cycles per second, and may be used for rough comparison purposes at radio frequencies. Another new instrument is a recording potentiometer designed to give continuous, accurate records of small variations in electro-motive force. The potentiometer is of the slide-wire type, but instead of the contact being adjusted by hand until balance is obtained, this is done automatically by the recorder mechanism. The galvanometer, which is connected in series with the unknown e.m.f., is of the moving coil type with double suspension. Slide-wires of various resistances can be supplied, depending on the range required. The most sensitive range available gives full scale deflection for 6 milli-volts. The range may be extended, as required, by means of an auxiliary resistance connected in series with the slide-wire. Alternatively, a fraction of the voltage may be tapped off by means of a volt box. The maximum sensitivity of the galvanometer with a coil of 1 700 ohms resistance is such that a change of 0.25 microampere produces a movement of the pen on the chart. A standard cell mounted in a small box underneath the instrument case enables the current in the slide-wire to be standardised.

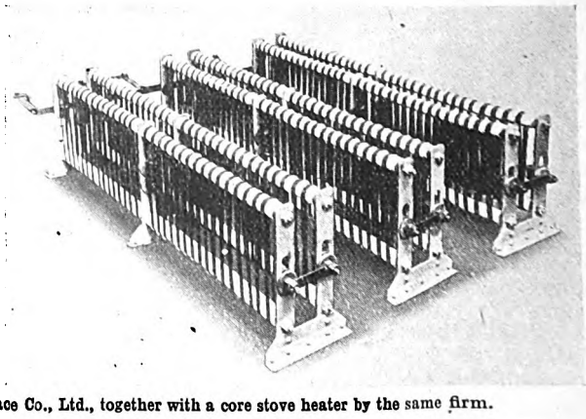


One of the street lamp standards of the Bromford Tube Co. Ltd.

GENT AND CO., LTD. (Faraday Works, Leicester). On this stand is displayed improved mining bells, and relays, suitable for working in parallel on bare wire signalling, and passed by the Home Office, also improved tapper keys, mining pushes, heavy duty power pushes, telephones, all incombustible and flame-proof. Water level indicators and alarms for indicating and recording step by step the rise and fall of liquid level. A new "Tangent" high and low liquid level alarm with diversion relay suitable for a.c. or d.c. circuits; also new model float switches. A new electric motor bell operated by a 1/10th H.P. motor suitable for fixing in the open, and for use at landing stages, ferries, fire stations, etc., is another exhibit. An interesting display is made of the "Pul-syn-etic" electric clocks, clocks in bakelite, cast-iron, watertight and wood cases, process timing clocks, together with "start and cease" sound signals, all controlled by a master transmitter on the stand. Other items are the "waiting train" turret clock; a motor driven striking apparatus, controlled by a time transmitter through hourly contact maker; "Parsons-Sloper" secret interphones; improved push button interphones, etc.; staff locaters; luminous, pendulum and drop indicators for hotels, ships, etc.; pneumatic bells and pushes; idle machine and output recording apparatus, etc.

MORE INDUSTRIAL PLANT.





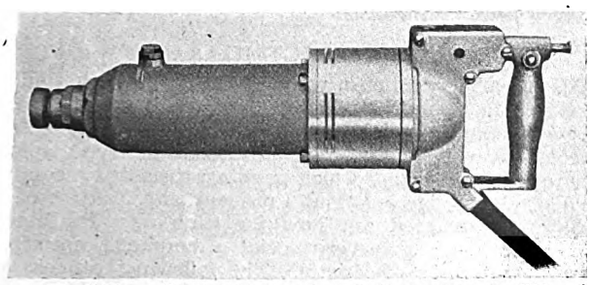
Examples of the Ajax-Wyatt furnaces shown by the Electric Resistance Furnace Co., Ltd., together with a core stove heater by the same firm.

Digitized by Google

HOLLINGS AND GUEST, LTD. (Thimble Mill Lane, Birmingham). The stand of Hollings and Guest, Ltd. comprises several interesting exhibits, which may be seen working. Of these may be mentioned a hydraulic four column press fitted with three steel hot plates giving two daylights, specially designed for the manufacture of artificial horn, fibre, bakelite mouldings and insulating materials of all kinds. The working table of the press is of cast iron 36 in. by 502, recessed for the ram and guided on the four columns. The press head is also of cast iron, machined on the underside to receive the hot plate. The three steel hot-plates are 36 in. by 30 in. by 2 in. thick, one being fixed to the underside of the head, one bottom plate attached to the press table and one intermediate hot plate being suspended between the top and bottom plates. The distance or daylight between the hot plates is 6 in. The cylinder of this press is of cast steel, bored for the ram and gland. The ram is of cast iron machined and polished and spigoted into the table with a stroke of 12 in. The four press columns are of mild steel machined all over. The steam supply is connected to the hot plates by flexible steam pipes. These presses can, of course, be made in various sizes and pressure according to the work required to be done. As regards the method of operation. Single presses can be worked by a hand pump, or power pump, and a battery of presses is more conveniently worked by means of a low-pressure water supply for closing the press, and the final high pressure being applied by means of a hand pump.

The COMMUTATOR GRINDING BLOCK CO. (16, Sugarhouse Lane, Greenock). Here are shown special blocks which the makers state should be regarded by every user of d.c. electrical machines, alternators, or slip-ring motors, as an essential part of his equipment. In the case of large users who maintain their own plant it shows a great saving in time and money. The blocks are formed with an abrasive compound which will neither load nor glaze through a wide range of speeds, but a clean cutting surface of large areas is presented to the surface of the work.

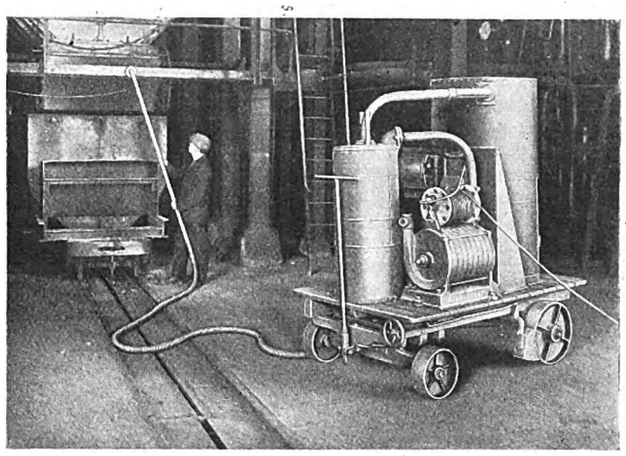
BLACKSTONE AND CO., LTD. (Stamford), present a comprehensive exhibit of their oil, petrol and paraffin engines, lighting sets, and "unchokeable" pumps. Five slow-running horizontal "Spring Injection" engines, from 14 B.H.P. single cylinder up to 130 B.H.P. twin are shown. This twin cylinder engine and a single cylinder engine of 55 B.H.P. are working light. An opportunity of seeing an engine working fully loaded is provided by a 76 B.H.P. twin-cylinder "Spring Injection" engine direct coupled to a dynamo and generating current for the stands. Two small self-contained totally enclosed "Spring Injection" oil engines, of 5 and 8 B.H.P., are also exhibited. This type of engine forms a handy and compact unit for contractor's or farm use. Three examples of the Blackstone "no trouble" petrol and petrol-paraffin engines are shown. There is a petrol engine of 2½ B.H.P. with hopper cooling tank; a 3½ B.H.P. petrol-paraffin engine on skids, and one of 6 B.H.P. on a concrete base. The petrol-paraffin engines are started up on petrol, and when, after a few minutes' running they are warm, the change over to paraffin fuel is made by a small hand lever. The engine



The "Kango" electric hammer shown by the Rawlplug Co., Ltd.

speed is governed, the governor operating on the carburettor and controlling both quantity and quality of the mixture. A 1½ kW petrol electric lighting set, complete with batteries, will be of interest to owners of country houses not yet reached by a public electricity supply. An interesting exhibit of an "unchokeable" pump at work is provided by a 3 in. horizontal pump, driven by a "Bull" motor, and handling spheres 2½ in. in diameter. Other "unchokeable" pumps on this stand are a 3 in. pump direct coupled to an electric motor; a 6 in. vertical pump suitable for handling unscreened sewage, storm water, etc.; an 8 in. horizontal gravel pump; and a portable set comprising a 4½ B.H.P. petrol-paraffin engine direct coupled to a 3 in. "unchokeable" pump.

THE RAY ENGINEERING CO. (Waterdale Works, Southmead, Bristol). On this stand are many examples of the now popular enclosed switchboard, not the least of these being an entirely new production in the form of an enclosed lighting plant switchboard in an aluminium and black enamelled case. The outstanding feature of this board is that all the switching functions of the plant are controlled by the turning of a single knob, making for the utmost simplicity in control. Interest



A vacuum cleaning equipment for factories, works, etc. (The Sturtevant Engineering Co., Ltd.)

will no doubt be shown in the new all-steel enclosed type switchboard which is being shown for the first time on this stand. The switchgear conforms, in the main, with the company's standard design of quick break knife type, the switches being built up in individual units and mounted behind sheet steel panels. The switches are mounted on bakelite bases, and operated by means of bakelite insulated toggle links, terminating in an insulated handle passing through an escutcheon plate in the sheet steel panel front. The makers state that there promises to be a large demand for this new type of switchboard, as all classes of switchgear, such as battery regulating, booster, starting and change-over switches, can be supplied similarly mounted, thereby obviating the necessity of special switchboard enclosures. Open type switchboards, battery charging resistances, and a new type of telpher are also shown.

(*To be continued.*)

THE ELECTRIC FITTINGS COMMITTEE.

Second Report for the Year ended March 31st, 1929—Changes in Personnel.

THE Committee held two meetings during the session 1928-9, the later one towards the close of 1928. Further meetings were deferred owing to the serious illness of the chairman. The committee was not called upon during the session for the exercise of its chief function—that of settling questions which might be raised as to "recognised" prices. The committee perfected its internal machinery during the session so that any party desirous of presenting a complaint, on calling upon the committee for the exercise of its statutory functions, can be assured of prompt action. For this purpose lists have been drafted of those authorities which had vested powers of sale, either full or with limitations, previously to the passing of the Act, thus obviating delay in answering enquiries. In regard to the committee's second function—that of "advising and assisting the persons concerned as to the method of giving effect to the section": During the session, the committee submitted to the Electricity Commissioners, at their request, a report on the general run of prices of "fittings" most likely to be in demand in rural areas. The committee also enlarged its sub-committee on installation work, as a result of which a unanimous report is about to be submitted to the committee. Though the committee and the conference committee, known as "Committee D," have no statutory connection, it is felt (the present membership of both bodies approximately corresponding) that this report would be incomplete without the short reference to it which appears as a "first annexe" to this report. The following changes in the committee's personnel were made during the year:—Mr. J. A. Crabtree, representing the B.E.A.M.A. Accessories Section, instead of Mr. F. J. Collis; and Mr. A. Albrecht, representing the E.W.F., instead of Mr. A. G. Beaver.

E.D.A. CAMPAIGN.

Half the Premises in Leeds Now Supplied. —Encouragement of Wiring Extensions.

MR. C. F. Wells, A.I.E.E. (sales engineer, Electrical Distribution of Yorkshire, Ltd.), gave an address before the British Electrical Development Association (North Midland area), Leeds, on February 4th, on "Domestic Electrification," with special reference to the E.D.A. Electric Homes (Outlet) Campaign.

Mr. Wells said that the consumption of the average domestic consumer was probably not much higher than 400 to 500 units per annum, and this figure could easily be increased tenfold with suitable tariffs, hiring facilities, and more efficient selling organisations. Most households were still prevented from using more apparatus because of the scarcity of plug points, and the present inadequacy of domestic wiring represented an enormous loss of business to our industry. There were in this country about 2 600 000 electricity consumers. If each of these consumers could be persuaded to spend £4 on extensions and improvements to their wiring installations, business to the extent of over £10 000 000 would result in wiring alone.

Last year, according to the report of the Electricity Commissioners to March, 1929, the electrical industry showed an increase in units sold by authorised undertakers of 11% on the previous 12 months. Even making allowance for trade depression, this result must be regarded as quite modest. There were several undertakings in the north Midland area whose annual increase in units sold was as low as 2%. On the other hand, there were undertakings such as Leeds which were now supplying 50% of the possible premises. The undertaking with which he was associated connected over 7 000 new consumers last year, and the increase in units sold was 30%.

The Red Seal campaign in America and Canada promoted by the Electric Service League had been successful in getting a very large number of builders to sign an agreement under which they undertook to wire every house they built to the Red Seal standard. In 1928 nearly 80% of the new houses built in Toronto were wired to this Red Seal standard, and there was no doubt that the campaign had increased enormously the market for electrical appliances in North America. At the end of 1929 there were nearly 20 000 000 houses (7 out of every 10) in America wired for electricity, with the following domestic appliances :—

	Millions.
Irons	14½
Vacuum Cleaners	6
Washing Machines	5
Fans	5
Toasters	4½
Coffee Percolators	3½
Refrigerators	0¾

They must all agree that houses wired for lighting only were deprived of the greatest service electricity could give. As much expert attention must be given to the wiring installation of a house as was given to the building construction, drainage system, and the water supply. No house could be considered up to date that lacked a sufficient electrical installation. The saving on domestic labour and the diminished cost of decoration renewals alone often represented economies beside which the cost of installation and current played but a minor role.

With electricity as cheap as it was to-day (over 22 000 000 people lived in areas offering a two-part tariff with 1d. or less as the unit price of electricity) all new houses should be wired in accordance with nothing less than the E.D.A. Electric Home Wiring, which provided for adequate electric lighting in accordance with modern requirements and, in addition, ensured a sufficient number of plug points, so that electrical appliances could be conveniently plugged in and used freely in every room.

THE "BLUE BOOK."

Messrs. Robert Hornby and Co., Ltd., whose advertisement appears on the "Meters" Guide Card, have asked us to draw the attention of subscribers to the "Blue Book" to the fact that, owing to a printer's error in their advertisement, the Watt loss is shown as 0·¾ watt. This should read 0·5 watt. Subscribers are asked to be good enough to make this correction to the advertisement.

TELEPHONE DEVELOPMENT.

Record Increase in Number of New Subscribers Obtained During Year.

SIR Alexander Roger, presiding at the fifth annual general meeting of the Telephone Development Association on Tuesday, said the subject of the development of the telephone habit was one of national interest and importance. They knew from the figures which were published that there had again this year been a record increase in the number of new telephone subscribers obtained. The late Chancellor of the Exchequer announced that some 5 000 post offices and 1 600 railway stations, all in rural areas, were to be equipped, for the most part during the six months following the date of the announcement, with telephone call boxes at ordinary rates—a total of between 6 000 and 7 000 additional call offices. They hoped they would see all these 6 000 or 7000 new rural call offices in full activity before long. The latest available figures, up to September 30th, 1929, showed the following increases over the figures at the end of September, 1928: Exchanges, 156; call offices (including telephone kiosks), 3 579; exchange stations, 126 988. The revenue from telephone rentals and calls, as shown by the latest commercial accounts, was well over £20 000 000, a gain of £1 500 000 over the previous year, the operating profit was £4 280 000, and the net surplus for the year £525 000. The business interests of this country were calling for the appointment of a committee to inquire into the practicability of transferring telephone and telegraph administration to a public statutory authority which would be constituted on similar lines to analogous authorities, such as the Central Electricity Board, the British Broadcasting Corporation, and others. The Association had gone into this question carefully, and the results of their investigations would be available shortly.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Technical Abbreviations.

[TO THE EDITOR.]

SIR,—In reply to your correspondent, "H. H.," may I give my opinion on the abbreviation "kWh," namely, that "k" and "h" stand for the Latin "kilo" and "hora" respectively, and that these should therefore be written with small initial letters, like most other technical expressions of Latin or Greek derivation.

As for the argument put forward by "H. H." concerning the German application of the abbreviation, I wish to state that frequently "kWSt" is used in Germany instead of "kWh," in which case "St" is the German abbreviation of "Stunde," i.e., hora, or hour (heure in French); and, being a noun, is written with a capital "S" in accordance with the rules of German grammar.—I am, etc.,

F. F. C. BERKELEY.
(Dipl.-Ing.)

Monkseaton.

BRISTOL ELECTRIC CLUB.

THE annual general meeting of the Bristol Electric Club was held at the Crown Hotel on January 31st, and there was a very good attendance of the members. The President, Mr. A. H. Dowson, was in the chair, and reports were received from the treasurer and secretary, which gave a satisfactory condition of the Club's progress. The President also addressed the meeting, and pointed out how the Club was fulfilling its meaning in breeding a very social atmosphere among the electrical fraternity of Bristol. The following officers were elected for the coming year: President, Mr. A. H. Dowson; Chairman, Mr. W. L. Richards; Hon. Treasurer, Mr. A. C. Baker; Hon. Secretary, Mr. F. R. Ashmead. Committee: Messrs. Nichol, Rogers, Denman, Walker, Wallis, Porter, Skinner, Cutler, Hodge, Lovell, Murphy and E. A. Davies. The Secretary's address is 75, Victoria Street, Bristol.

In the summary communicated by the I.E.E. of the discussion at an informal meeting on January 26th, which appeared in THE ELECTRICIAN of February 7, Mr. A. F. Harmer was reported to have asked "why Mr. Twiss was erecting 33kV lines which must shortly become obsolete?" We are informed that Mr. Harmer's question actually referred to 3 000 V lines.

NEWS IN BRIEF.

Overseas Trade Returns—Electric Railways in Sweden—Stoke-on-Trent and the E.C.A.—Autumn Meeting of the Iron and Steel Institute—Burnley and the Wireless Listener.

THE annual general meeting and the annual dinner of the Institution of Heating and Ventilating Engineers took place on Wednesday. At the meeting Mr. E. R. Jones delivered his presidential address, and a paper by Mr. Sam Fox, on "Half a Century of Boiler Making," was read.

The electrification of the Government railway, 285 miles in length, between Stockholm and Gothenburg has produced such satisfactory results that the Swedish Railway Board is submitting a preliminary scheme for the electrification of the Stockholm–Malmoe–Traelleborg main line, 391 miles in length, and certain branches, at a cost of £305 332.

Glasgow Health Committee has decided to provide X-ray equipment at the Bellefield Sanatorium, at a cost of £470.

Glasgow Corporation Health Committee has asked the electricity department to renew the power and lighting cables within Ruchill Hospital grounds, at an approximate cost of £2 500.

Many tenants on Accrington municipal housing sites are unable to meet their electricity bills, and a system whereby they may pay 1s. per week extra in rent towards the accounts is being adopted.

A meeting of the American Electrochemical Society will take place at St. Louis, Miss., from May 29th to 31st, inclusive. A meeting of the society is also to be held at Detroit from September 25th to 27th, inclusive.

A meeting of the Association of Mining Electrical Engineers, South Wales Branch, will be held at the South Wales Institute of Engineers, Cardiff, to-morrow (February 15th). Mr. W. A. Hutchings will read a paper on "Safety and Efficiency in Mines."

Mr. C. H. Yeaman, city electrical engineer, Stoke-on-Trent, has submitted to the Electricity Committee a schedule showing the fixed prices at which members of the local branch of the Electrical Contractors' Association are prepared to carry out installations under the assisted wiring scheme, and he has been authorised to arrange with the Association to carry out installations at the prices submitted.

"Electricity your Servant" was the title of a talk given last week by Mr. L. Burdes to members of the Bristol Branch of the Women's Electrical Association. With regard to the heating of rooms, it was stated that electrical panels behind walls or in the ceiling were a satisfactory means of regulating temperature, the current being switched off automatically when the desired temperature is reached.

The Iron and Steel Institute will hold an autumn meeting at Prague, Czechoslovakia, from September 15th to 20th next. The sessions for the reading and discussion of papers will take place in the new building of the Society of Czechoslovakian Engineers. Banquets and visits to places of interest are included in the programme. Further particulars from the Secretary, 28, Victoria Street, London, S.W.1.

Mr. M. Wadeson, chairman of the Sheffield Section of the Junior Institution of Engineers, spoke, at a recent meeting of the Section, on matters affecting the electricity supply industry. It had been asked, he said, why electricity tariffs were not uniform. Electricity tariffs were based on much the same system as the telephone, where the charges were lower during the periods when the telephones were least used.

It is reported in the "Record," the journal of the Transport and General Workers' Union, that 14 members of the union, formerly employed at the Stroud generating station of the Kent Power Co., have collectively been awarded £3 500 compensation for loss of employment due to the closing of the station in June, 1928. The Electricity Commissioners awarded compensation in sums ranging from £422 to £93.

In the Irish Free State over 21 000 000 telephone calls were registered last year. Dublin has one telephone user to every 25 of the population. Following a trial period and vote of telephone users, the Dublin telephone service is being transformed to the automatic system. No less than 90% of the subscribers who voted gave a verdict in favour of automatics. At the present rate of progress, Crown Alley, which is the exchange for almost half the telephone subscribers in Dublin, will be entirely automatic by the end of February.

Glasgow Health Committee is considering the installation of an automatic fire alarm system at Knightswood Hospital.

Leafield, Oxon, Baptist Church has been provided with an electric lighting installation as a memorial to the late Mr. J. W. Abraham.

The number of stations in the Post Office telephone system at the end of last November was 1 837 045, an increase of 14 055 on the total in the previous month. London's share was 657 304.

Blackburn Council has discontinued the practice of requiring domestic consumers to pay a deposit of £1 per house, and such sums already paid are to be returned, with interest.

According to the Board of Trade returns for the month of January, the total United Kingdom exports were valued at £58 262 478, a decline of £8 617 129 on January of last year. The total imports were valued at £101 853 658, a decrease of £14 692 030 on January, 1929.

In view of the general practice now in operation of installing electricity for lighting and gas for cooking and heating in all new dwellings, London County Council has not seen its way to agree to a suggestion put forward by representatives of the Co-partnership Committee of the South Metropolitan Gas Co. that dwellings erected by the Council should be carcassed for gas lighting in addition to being wired for electric lighting.

A suggestion has been made that Burnley Corporation should consider the question of relieving wireless licence holders of expenditure which they will have to incur to readjust their sets through the Corporation changing over from d.c. to a.c. The Electricity Committee is of opinion that any attempt to make them responsible for such expenditure would not be reasonable. They were not consulted about installations fixed, and no privileges were given.

The Government has decided to increase its grant to the British Engineering Standards Association. The Board of Trade will make an appropriation to the Association of £3 000 a year for 1930-31 and for the four succeeding years, and in the second year it will increase the grant by giving £1 for every £3 that the Association may raise from industry in excess of £13 000, the maximum total grant being limited to £5 000 in any one year. The grant by the Government to the Association has hitherto been £105 per annum.

The Leipzig Fair, at which about 10 000 firms exhibit, has become both an international and universal world market. It has been divided into two separate sections, known as the great engineering and building fair and the samples fair. Lighting fittings and art and artistic handicraft are amongst the branches of the samples fair, and the engineering and building section includes power and driving machinery, transport plant, and electrical engineering. The samples fair will be open from March 2nd to 8th and engineering and building from March 2nd to 12th.

LOOKING BACKWARD.

FIFTY years ago, THE ELECTRICIAN *of February 14th,* 1880, *briefly described a primitive hydro-electric installation at a chemical works in Greenwich, where a neighbouring waterfall furnished power for a turbine which drove a "Siemens machine," the current being conveyed* 150 *yards to a second Siemens machine in the workshop, this, in turn, driving the belting.*

In order to compare the light of gas and that of electricity a gentleman offered to provide the necessary apparatus to illuminate the bridge at Maidstone.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of February 10th,* 1905, *the receipt of wireless messages over distances up to* 600 *miles, transmitted by ships with* 1 *kW sets, was regarded as meriting attention.*

It was stated that the sum total of the capacities (including accumulator capacities) of all the German generating stations, on April 1st, 1904, *was* 531 000 *kW.*

A rough model of the Kearney-Thom mono rail was exhibited at an Arts and Industrial Exhibition in Battersea Town Hall.

PERSONAL.

MR. C. C. Rattey, chairman of the Alton Battery Co., Ltd., has returned from his tour abroad, having visited British Columbia, Japan, China, the F.M.S. and Ceylon.

Wolverhampton T.C. has appointed Mr. T. A. G. Margary, distribution engineer, as borough electrical engineer, at a salary of £1 000 a year, rising by annual increments of £50 to a maximum of £1 200.

At the request of the Turton U.D.C. Mr. A. J. Hutchinson, chief electrical engineer and general manager to the Farnworth U.D.C., has been permitted to act as consulting engineer, with regard to a large extension scheme for the above Council.

Out of 33 applicants, Mr. C. H. Stafford, deputy-manager and assistant engineer of Reading Tramways, has been appointed manager of Burnley Corporation tramways and transport department in succession to Mr. H. Mozley, who retires on superannuation.

Mr. David Maxwell Buist has been appointed as district engineer for North East England. Mr. Buist up to this appointment has been in charge of the electrical work at the Billingham factory of Imperial Chemical Industries. Prior to that he was at Hull, having gone to there from Edinburgh Corporation. See page 213.

At a meeting of Exeter City Council last week, the Electricity Committee recommended that Mr. H. D. Munro, whose retirement is pending, be engaged for 12 months from April 29th next as consulting engineer at a fee of 200 guineas, and that Mr. A. L. Keet be appointed to perform the duties of electrical engineer from March 29th, at a salary of £700 a year, that position to be reviewed at the end of 12 months.

A presentation took place at the Crompton Parkinson, Ltd., works at Chelmsford on January 31st, to Mr. H. Church and Mr. S. E. Collis on the occasion of their leaving the company, to start an electrical engineering business in Chelmsford. The presentation took the form of an oak desk, a fountain pen and a framed photograph of the management and foremen to Mr. Church, and a wristlet watch and pipe to Mr. Collis. The gifts were handed to the recipients by Col. Hardie, general manager at Chelmsford, before a large gathering of employees, and in doing so he wished them the very best of success.

Leading members of the electrical and heavy engineering trades met on February 3rd at the Zetland Hotel, Middlesbrough, when a complimentary dinner was given to Mr. O. S. Nichols, the Tees-side representative of the British Thomson-Houston Co., Ltd., who has left to take up a similar appointment in Liverpool. The chair was taken by Mr. Percy Glover of the Furness Shipbuilding Co., Ltd., and the health of Mr. Nichols was proposed by Mr. D. J. E. Richards, of Synthetic Ammonia and Nitrates, Ltd. Mr. R. N. Crawford, of British Insulated Cables, Ltd., endorsed the sentiments expressed, and made the presentation of a suitably engraved silver salver and a Jensen cigarette lighter. Mr. H. Sanderson, of Arthur Jones and Co., proposed the health of Mr. A. D. Mackinnon, who is succeeding Mr. Nichols.

At a meeting of the newly elected District Council for the North-Western Area, on February 4th, Ald. T. E. Higham (Accrington) was again appointed chairman for the eleventh year in succession; Mr. J. T. Watkins was reappointed vice-chairman. A welcome was extended to the two new members on the employers' side, i.e., Aldermen Billington (Salford) and Freemen (Oldham). A similar meeting took place (on the same day) of the District Joint Board for the area. Ald. T. E. Higham was appointed chairman, and Mr. G. E. Smith (Barrow) vice-chairman. A welcome was extended to the new member on the employers' side, i.e., Ald. E. Porter (Blackburn). After the conclusion of the Board meeting, Mr. J. W. Thomas having been invited to join the meeting, was presented with a reading lamp as a mark of good feeling.

Obituary.

MR. ARTHUR GREENHOW-LUPTON, aged 79 years, on February 8th, a promoter and for many years chairman of the Yorkshire Electric Power Co.

MR. SYDNEY W. BAYNES, on February 6th, who from 1895 until December, 1927, was chief electrical engineer of the St. Pancras (London) B.C. Mr. Baynes was one of the pioneers of the electricity supply industry and in the early days was the electrical engineer to the Forth Bridge works, afterwards carrying out contracts with the Central Argentine Railway and the Kensington and Knightsbridge Electric Lighting Co. For seven years he was chief engineer to Bradford Corporation electricity department and took up his position with the borough of St. Pancras in 1895. See page 213.

BUSINESS ITEMS.

NEW premises in the Parsonage, Manchester, have just been taken by the REVO ELECTRIC CO., LTD.

The Liverpool branch of the BRITISH THOMSON-HOUSTON CO., LTD., has been transferred from South Castle Street to 27–29, Stanley Street. Tel.: Bank 5 700.

The address of COMBUSTION STEAM GENERATOR, LTD., Southampton Row, London, W.1, has been changed to Africa House, Kingsway, W.C.2. Tel.: Holborn 2 002.

The electrical work for the extensive model dairy established at Oswaldtwistle by BLACKBURN, ACCRINGTON AND OSWALDTWISTLE CO-OPERATIVE SOCIETY has been carried out by Mr. JOHN WALSH, of Blackburn.

We are informed that the ALTON BATTERY CO., LTD., supplied the battery equipment for the £6 000 000 hydro-electric scheme recently put into commission at Lochaber for the North British Aluminium Co., Ltd.

BRITISH INSULATED CABLES, LTD., of Prescot, have in the last few days secured an order for the supplying and laying of 66 000 V cables for one of the large power companies operating in London. The value of the contract is in the neighbourhood of £250 000. The company has also secured the contract for the supplying and laying of the new G.P.O. trunk telephone cable from Manchester to Chester, a distance of 42 miles. Large orders have also been received for telephone cables for shipment abroad. These include 96 000 yards of underground cable and a short length of submarine cable for Shanghai, and 20 080 yards of underground cable for Australia. An order has also been received by the Southern Railway for 40 000 rail bonds.

The BRITISH GENERAL ELECTRIC CO. LTD., of Wellington, N.Z., has received a number of interesting orders, amongst them being one from the Auckland Electric Power Board for two 1 000 kW 750 r.p.m. motor-started rotary convertors (each with its 1 100 kVA 3 phase transformer) and fully automatic switchgear for the convertors and four track feeders; the whole equipment is arranged for supervisory control if required. This order follows closely on the recent order for tramway motors, so that G.E.C. plant will be used in Auckland not only for the conversion of power but also for the propulsion of the trams. For the interconnection of the Waitaki (110 kV) and Lake Coleridge (66 kV) power schemes in the South Island, the B.G.E.C. has received an order for seven 5 500 kVA 63 500/38 100 V outdoor type single phase auto-wound transformers. The stations are about 160 miles apart and the G.E.C. transformers will form two 16 500 kVA three-phase 110/66 kV banks (with one spare) for their interconnection. The transformers are of the oil-immersed type fitted with detachable cooling radiators, and an unusual feature is the 11 kV tertiary winding, which allows each bank to supply power to a 10 000 kVA synchronous condenser. An order has also been received for auxiliary generating plant and switchgear for the Waitaki power station; this includes two 315 kVA 420/410 V 3-phase 50-cycle alternators and two 120 kW 230 V d.c. generators (all running at 750 r.p.m. and coupled in pairs to water turbines), an 8-panel 420 V a.c. flat back switchboard, and a 6-panel 220 V d.c. flat back board.

THE NATIONAL REGISTER.

List of Registered Electrical Installation Contractors Further Extended.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on February 7th, fourteen applications for registration were received from electrical installation contractors. Of these, ten were accepted, two declined, and two withdrawn.

The names and addresses of the successful applicants are as follows:—

Hulton and Hinchliffe, Ltd., 42, Bottom o' th' Moor, Oldham.
Brandrick, James, 18, Middleton Road, Royton.
Ward and Co. (Dewsbury), Ltd., 15, Northgate, Dewsbury.
Calligan, Tom, Carlton Place, Greenfield, near Oldham.
Hutt, Wilfrid George, 26, South Ealing Road, London, W.5.
Cooper and Sellers, 28, High Street, Wellingborough.
Barnsley Corporation, Electricity Department, Queen's Road, Barnsley.
Rigby and Partners, Ltd., 53, Victoria Street, Westminster, London, S.W.1.
Farrar, Marmaduke F., 14 and 16, Crossley Street, Halifax.
Kettering Urban District Council, Electricity Department, Rockingham Road, Kettering.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BEXLEY URBAN DISTRICT COUNCIL.—Manufacture and supply of 1 400 kVA Scott-connected transformer bank; and switchgear and cables for same. Specification, etc., from Mr. A. J. Abraham, Electricity Department, Broadway, Bexleyheath, Kent; deposit £1.

DUNDEE CORPORATION.—Electric lighting work at 3, Fleuchar Street, Dundee. Particulars from the City Engineer, 91, Commercial Street, Dundee.

SALFORD GUARDIANS, February 15th. — Electric lighting of lodge and new roads, Eccles New Road, Pendleton. Specification from Mr. E. H. Inchley, Poor Law Offices, Eccles New Road, Salford; deposit, £2 2s.

TORQUAY CORPORATION, February 15th.—Two water tube boilers, economisers, etc., for the electricity works. Specifications, etc., from the Borough Electrical Engineer and Manager; deposit £3 3s.

BLACKPOOL CORPORATION, February 17th.—Supply of electrical sundries, etc. Forms of tender and specifications from the Borough Treasurer, Town Hall, Blackpool. Stamped, addressed envelope to be sent.

EDMONTON GUARDIANS, February 17th.—Six months' supply of electric lamps, X-ray, light and massage requisites, etc. Forms of tender, etc., from the clerk, Mr. E. Ridley, Board Room, 77, Bridport Road, Edmonton, London, N.18. Stamped, addressed envelope to be sent.

GLASGOW EDUCATION AUTHORITY, February 17th. Electric lighting installation in temporary school at Baird Street, Govan. Specifications, etc., from the Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s.

HARROGATE CORPORATION, February 17th.—Twelve months' supply of electric lamps, lamp columns, etc. Forms of tender, etc., from the Borough Engineer.

HULL CORPORATION, February 17th.—Twelve months' supply of stores to the tramways department, including controller and motor parts, carbon brushes, trolley gear, cable, lamps and fittings, copper wire, insulating tapes, commutators, overhead line fittings, etc. Forms of tender, etc., from the General Manager, Tramway Offices, Albion Street, Hull.

PLYMOUTH CORPORATION, February 17th–20th.—Supply of electricity meters, paper insulated cables and transformers. Specifications, etc., from the City Electrical Engineer, Electricity Offices, Armada Street, Plymouth, until February 17th. Tenders by February 20th.

WIMBLEDON CORPORATION, February 17th.—One 7 500 kW, two-phase turbo-alternator, condensing plant and auxiliaries. Specification, etc., from Mr. A. E. McKenzie, Electricity Works, Durnsford Road, Wimbledon, London, S.W.19; deposit £2 2s.

HOLBORN (LONDON) BOROUGH COUNCIL, February 18th.—Twelve months' supply of electric lamps, etc. Specification, etc., from the Borough Engineer, Town Hall, High Holborn, London, W.C.1.

LEEDS CORPORATION, February 18th.—One year's supply of stores to the electricity department, including i.r. covered cables, mains boxes and fittings, jointing and insulating materials, fittings and sundries (section N). Forms of tender, etc., from Mr. C. Nelson Hefford, Electricity Department, 1, Whitehall Road, Leeds.

Tramway Stores.

MANCHESTER CORPORATION, February 18th.—Supply of stores to the transport department, including parts of electrical equipment of tramcars, overhead equipment, power and lighting cable, bell wire, lamps, tramcar axles, tyres, etc. Schedules, etc., from the General Manager, Transport Department, 55, Piccadilly, Manchester.

STOCKPORT CORPORATION, February 18th.—One 60-ton electric crane and gantry. Specification, etc., from Mr. R. Lee, borough electrical engineer.

HULL CORPORATION, February 19th.—Supply of electricians' material, etc. Forms of tender from the City Engineer.

LEEDS EDUCATION COMMITTEE, February 19th.—Electrical work in connection with repairs to buildings. Further particulars from the Architects' Section, Education Department, Calverley Street, Leeds.

METROPOLITAN ASYLUMS BOARD, February 19th.—Electric light installation at Woolwich Casual Ward (contract No. 3); electric light installation at Lambeth Casual Ward (No. 4), conversion of workshop power units to electricity at Darenth Training College (No. 5); and installation of wireless receiving apparatus at Northern Hospital, Winchmore Hill (No. 6). Specifications from the Board's Offices, Victoria Embankment, London, E.C.4; deposit £1 for each.

WEST RIDING EDUCATION COMMITTEE, February 19th.—Electric light installation at Rawmarsh New Senior School, Mining Centre and caretaker's house. Specifications, etc., from the Education Officer, County Hall, Wakefield.

Street Lighting Equipment.

BANGOR (CO. DOWN) CORPORATION, February 20th.—Manufacture and supply of steel electric lamp standards, with boxes, brackets and lanterns. Specification, etc., from the Borough Electrical Engineer, 19, Bridge Street, Bangor, Co. Down.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 20th.—Electric lighting installations in four blocks of tenement buildings. Specification, etc., from Mr. D. J. Keep, town clerk, deposit £2 2s.

HULL CORPORATION, February 20th.—One 1 000 000 gallons per hour, natural draught cooling tower (contract 152); cast iron circulating water pipes (contract 153); and two motor-driven, vertical spindle drainage pumps. Specifications from Mr. J. N. Waite, city electrical engineer, Electricity Works, Sculcoates Lane, Hull; deposit £2 for each.

SALFORD CORPORATION, February 20th.—Electric light installation at Tootal Drive School. Further particulars from the Secretary, Education Offices, Salford.

CENTRAL ELECTRICITY BOARD, February 22nd.—Transformer oil-treating plant for 18 transformer stations in the area of the Central England Scheme. Specification (No. B.E.—P.S. 2), etc., from Mr. R. E. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 24th.—Supply of prepayment meters. Specification from Mr. D. J. Keep, town clerk, Town Hall, Cambridge Road, London, E.2; deposit £2 2s.

BRENTFORD GUARDIANS, February 26th.—Provision of central switchboard and laying of electric mains at West Middlesex Hospital, Isleworth. Specification, etc., from Messrs. Dodge and Reid, 120, High Street, Brentford; deposit £1 1s.

CROYDON CORPORATION, February 26th.—Six months' supply of electrical fittings and appliances, etc. Specification, etc., from the Union Offices, Mayday Road, Thornton Heath. Stamped, addressed envelope to be sent.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 26th.—Twelve months' supply of electric lighting sundries, insulated wires, ordinary and prepayment meters, insulating compound; h.t. and l.t. concentric, paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer, 85, Fulham Palace Road, London, W.6.

WEST RIDING EDUCATION COMMITTEE, February 28th.—Electric light installation in Southowram Withinfields Council School. Specification, etc., from Mr. G. Dodgson, Education Office, Huddersfield Road, Elland.

OXFORD CORPORATION, March 1st.—Manufacture and erection of engines and pumps, including two oil-driven auxiliary engines each driving an electric generator; electric light installation, etc. Specification, until noon on March 1st, from Sir A. Binnie, Son and Deacon, Artillery House, Artillery Row, Westminster, S.W.1; deposit £10.

BELFAST CORPORATION, March 3rd.—Twelve months' supply of materials to the electricity department, including electrical accessories, lamps, carbon brushes, bitite strip, tapes, joint box compound, street box frames and covers, feeder and section pillars, copper cable connectors, electricity meters and instrument transformers, maximum demand indicators, automatic time switches, cut-outs, transformers, cables, wires and flexibles, etc. Forms and tender, etc., from Mr. F. H.

Digitized by Google

Whysall, city electrical engineer and manager, East Bridge Street, Belfast.

CENTRAL ELECTRICITY BOARD, March 3rd.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme. Specification (No. S.E.E.—P.F. 5) from the secretary and solicitor, Mr. R. H. Fox, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

DOVER HARBOUR BOARD, March 3rd.—Twelve months' supply of electric cables, electrical sundries, etc. Schedules, etc. (2s. 6d.), from the office of the Register, Castle Street, Dover.

HALIFAX CORPORATION, March 3rd.—Electrician's work at public conveniences. Specification, etc., from the Borough Engineer, Crossley Street, Halifax; deposit £1 1s.

SOUTHEND CORPORATION, March 3rd.—Twelve months' supply of stores, including meters and instruments, electrical fittings, cables and steel conduits, joint boxes, earthenware conduits, etc. Specification, etc., from the Borough Electrical Engineer and Manager, Electricity Works, London Road, Southend-on-Sea.

BEDFORD CORPORATION, March 10th.—Supply during one year of e.h.t., h.t. and l.t. underground cables; and incandescent lamps. Specifications from the Borough Electrical Engineer, Prebend Street, Bedford. Tenders from British manufacturers in the United Kingdom only are invited.

PRESTWICH URBAN DISTRICT COUNCIL, March 10th.—Twelve months' supply of lamp standards, electric lamps, etc. Forms and tender, etc., from Mr. H. T. Ainsworth, surveyor, Town Hall, Prestwich, Lancs.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, March 19th.—Coal-handling plant at Ironbridge generating station. Specification (No. 8), etc., from Mr. E. F. Hetherington, Phœnix Buildings, Dudley Road, Wolverhampton.

Overseas.

UNLESS otherwise stated particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, February 15th.—Supply of 1 771 metric tons of telegraph wire. (Reference A.X. 9 047).

LOUIS TREICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of distribution system poles, conductors, transformers, meters, sub-station equipment, etc.). (Reference B.X. 6 003.)

LOUIS TREICHARDT (SOUTH AFRICA) MUNICIPALITY, February 18th.—Supply and erection of two 60 kW sets, comprising two boilers, one economiser, a steel chimney, two engines, two alternators, and accessories, or, alternatively, two 100 kW sets. (Reference A.X. 8 997.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (schedule C. 541). (Reference B.X. 5 940.)

CHILEAN STATE RAILWAYS, February 19th.—Supply of apparatus and material for a signalling service between Maipu and Cartagena stations and between San Fernando and Talca stations. (Reference A.X. 9 008.)

JOHANNESBURG MUNICIPALITY, February 20th.—Supply of transformers. (Reference B.X. 6 043.)

JOHANNESBURG MUNICIPALITY, February 20th.—Supply of switchgear (contract 322). (Reference B.X. 6 044.)

ROYAL YACHTS, ALEXANDRIA, EGYPT, February 20th.—Supply of electrical materials. Specification, etc., can be seen at the Department of Overseas Trade, London. (Reference B.X. 6 133).

SOUTH INDIAN RAILWAY CO., LTD., February 21st.—Supply of wood sheet separators for train lighting cells. Specifications, etc. (5s.) from the company's offices, 91, Petty France, Westminster, S.W.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 11th.—Supply of bells and buzzers (schedule C. 552). (Reference B.X. 6 043.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 13th.—(extension of time).—Supply of electric tube butt welder. (Reference B. 6 116).

EGYPTIAN MINISTRY OF THE INTERIOR, March 20th.—Steel water tank, on steel tower, with piping and fittings; and electric water level indicator. (Reference A.X. 9 073.)

CAPE TOWN MUNICIPALITY, April 2nd.—Supply of five sets of electrically-driven pumps and accessories, including motors, switchboard, etc. (specification No. 485/29). (Reference A.X. 9 096).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

Tenders Accepted.

EALING CORPORATION.—W. G. Hutt, wiring houses on North and South Roads, £1 182.

BIRMINGHAM GUARDIANS.—Reynolds and Bradwell, electrical works at Western Houses.

SOUTHEND CORPORATION.—Davey and Armitage, supply of 1 600 electric meter boards, £156.

BOLSOVER COLLIERY.—Edison Swan Electric Co., Ltd., supply of standard lighting lamps.

BARKING URBAN DISTRICT COUNCIL.—A.C.E.C. Co., supply of cable, £1 177 2s. (Recommended.)

CHIPPENHAM GUARDIANS.—Western Electric Supply Co., motor for driving washing machine, £37.

WANDSWORTH (LONDON) GUARDIANS.—H. R. Soutter, 18 electric sterilisers, loading 1 kW each.

YORK CORPORATION.—Barber and Colman, provision of traffic signals, £528 16s. (Recommended.)

SALFORD CORPORATION.—Barber and Colman, Ltd., supply of traffic signals, £144 5s. (Recommended.)

BANGOR CORPORATION.—Owen and Palmer, installation work in houses to be wired on instalment plan.

BIRKENHEAD CORPORATION.—Express Lift Co., electrification of lift at Art Gallery, £70. (Recommended.)

SANDBACH URBAN DISTRICT COUNCIL.—North Wales Power Co., electric light installation at town hall, £89 7s. 6d.

GRIMSBY CORPORATION.—Foster Engineering Co., Ltd., supply of testing equipment, £295 4s. (Recommended.)

EAST HAM CORPORATION.—Hart Accumulator Co., Ltd., control battery and switchboard, £265. (Recommended.)

METROPOLITAN WATER BOARD.—Edison Swan Electric Co., Ltd., supply of 2 640 yds. of cable, £90. (Recommended.)

MARTLEY RURAL DISTRICT COUNCIL.—J. Leeming and Co., electric wiring of 21 cottages, £82, and 11 bungalows, £39.

FULHAM (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., provision of ceiling lights in the Council chamber, £160.

BELFAST EDUCATION COMMITTEE.—G. R. Craig and Co., electric lighting at Hardcastle Memorial Elementary School, £264.

BEXHILL CORPORATION.—H. W. Elsworth, electric lighting and power installation at isolation hospital, £149 (all recommended).

LOWESTOFT CORPORATION.—New Destructor Co., Ltd., fan blast apparatus at refuse destructor works, £275. (Recommended.)

SWANSEA CORPORATION.—Relay Automatic Telephone Co., £260, provision of internal telephone system at Hill House hospital.

MANCHESTER CORPORATION.—British Thomson-Houston Co., Ltd., installation of 33 000 V feeder reactors at Barton power station.

BRIGHTON CORPORATION.—British Separators, Ltd., supply of electric heater for raising temperature of oil at Southwick power station, £135 15s.

HACKNEY (LONDON) BOROUGH COUNCIL.—Tudor Accumulator Co., Ltd., supply of 200 positive plates for main battery, £120. (Recommended.)

OLDHAM EDUCATION COMMITTEE.—Charlesworth and Co., electrical installation at Freehold school and wiring at Electrical Engineering Laboratory.

EARTHED PLUGS AND SOCKETS.

A revision of B.S.S. No. 196 has been issued by the B.E.S.A., one of the differences between the new (1930) and the 1927 edition relating to the dimensions of the lug on the non-reversible plug and socket. It has been found that, with slight irregularities in manufacture, there was a risk in some cases of being able to force the lug (the non-reversible device) into a hole in the socket not intended for the reception of this lug. A slight modification to the dimensions has, therefore, been made in order to remove this possibility.

Copies of the Specification, No. 196, 1930, may be obtained from the Publications Department, 28, Victoria Street, S.W.1.

ELECTRICITY SUPPLY.

The Yoker Power Station—Proposed Main Extensions at Battersea—Walthamstow and Unemployment—Dnieper River Hydro-Electric Developments—Lightning and Overhead Transmission Lines.

HORNSEY Electricity Committee is to extend mains at a cost of £1 200.

The Clyde Valley Electrical Power Co. is to extend its Yoker power station.

Glasgow Electricity Committee has authorised mains extensions at a cost of £8 100.

A resolution that all new streets be lighted by electricity has been passed by Clitheroe T.C.

Lancaster T.C. has decided to carry out mains extensions to a number of surrounding villages.

Stretford and District Electricity Board is having a scheme prepared for the electric lighting of the Irlam district.

Application for a loan of £10 000 for mains and services for the ensuing three years has been made by Taunton T.C.

Walsall Electricity Committee recommends an expenditure of £15 500 on mains, sub-station equipment and buildings.

The London Power Co. has submitted to London County Council notice of intention to lay mains along a number of routes from Battersea.

The Ministry of Transport has refused the application of the Grampian Electricity Supply Co., Ltd., for permission to use overhead lines in the Borough of Doune.

Guildford Corporation has received the assent of Shere P.C. to the erection of overhead lines at Shere. The Electricity Committee has decided to carry out the extension.

Mr. G. Sommerville has been requested to draw up for Faversham T.C. a scheme of assisted wiring. An application is to be made for an extension of the area of supply.

The Holywood electricity scheme, which will cost £10 000, is nearing completion. Energy is to be taken from the Ballymacarett sub-station of the Belfast electricity department.

The East Devon Electricity Co. has entered into an agreement with Exeter Corporation for a supply of electricity in bulk for distribution throughout Devon and part of Somerset.

Walthamstow T.C. has adopted a scheme in connection with the relief of unemployment, for laying electric cables in all roads where a supply is not at present available, at an estimated cost of £134 867.

The Shropshire, Worcestershire and Staffordshire Electric Power Co. seeks authority to include the borough of Stratford-upon-Avon in its area of supply as well as certain areas in the county of Hereford.

Stoke-on-Trent Electricity Committee has received sanction to borrow sums amounting to £20 952 for electricity services; re-laying and extension of mains and provision of a sub-station in Lichfield Street, Hanley.

Tynemouth Electricity Committee seeks sanction to borrow £15 000 for further installations under the assisted wiring scheme; £5 000 in respect of supplying prepayment meters and £5 000 for general extensions.

Bermondsey (London) Electricity Committee reports that it will be necessary to run two new feeder cables to positions near Rothsay Street and near Crucifix Lane and White's Grounds, at a cost of about £6 000.

Birkenhead Electricity Committee has decided to proceed, in stages over a period of years, at a cost of £10 100, with the work of substituting an a.c. supply for the existing d.c. supply in Grange Road, Cavendish Drive and Bebington Road.

It is understood that the Governor of Northern Ireland has been invited to perform the ceremony of switching on the Holywood electricity supply. Already a large number of shopkeepers and residents have had their premises wired, and a large demand for power is anticipated.

Grantham R.D.C. has been informed by the Commissioners that it is proposed to grant an order to Mr. R. Borlase Matthews for the supply of electricity in the area. The Council has approved the scheme. Bourne U.D.C. has approved of a similar scheme put forward by Mr. Matthews.

Luton T.C. has decided to give a supply of electricity to Ascott House, Wing, the residence of Mr. Anthony de Rothschild, and to the parish and neighbourhood. An additional 6 000 V feeder cable is to be laid for augmenting the supply of the Lee Ward at an approximate cost of £2 600.

Electricity Distribution of North Wales and District, Ltd., has informed Ellesmere U.D.C. of its application, under the Development Act, for assistance to enable it to carry out the construction of lines from Nantwich through Whitchurch and Ellesmere. The Council has decided to support the application.

Four 77 500 kVA hydro-electric generators, which it is said will be the largest in the world, are being manufactured by the General Electric Co. of New York for the Dnieper River development at Kichkas, near Zaporozhe, in the Ukraine. The weight of each generator will be approximately 786 tons.

London County Council has consented to a proposal of Chelsea Electricity Supply Co. to change its system and pressure of supply from d.c. at 200/400 V to a.c. at 230/400 V, and to a proposal of Battersea B.C. to instal an a.c. distribution system in that part of the borough in which a d.c. supply is now given.

Bridlington T.C. has applied for a loan of £3 000 for mains and for £1 000 for services. The Commissioners are to be approached with a view to the elimination of certain parishes from the draft Order of the Holderness Trust, Ltd., and their inclusion in a Special Order to be applied for by the Corporation.

Stoke-on-Trent Electricity Committee has accepted a tender amounting to £710 for the erection of a sub-station in Garner Street.—The Committee has authorised mains extensions at a cost of £2 000.—Sanction has been obtained to borrow £2 442 in connection with the bulk supply of electricity to Leek U.D.C.

Eastbourne Electricity Committee has discussed the question of the use of inferior lamps, and has decided to bring the matter to the notice of the I.M.E.A., with a view to their considering the advisability of issuing a statement on the question of the use of cheap lamps and which might be suitable for insertion in the local papers.

Carrickfergus U.D.C. decided last week to apply for an Order to authorise an electrical scheme for the district, and that Mr. J. Scott be retained to prepare a scheme. Mr. Scott estimates the cost at £25 000, covering three years. He suggests that the Council should add the Ballynure district to the proposed supply area.

An inquiry has been held by the Electricity Commissioners for Northern Ireland into applications by the Dungannon Gas Co. and the Dromore Electrical Lighting Co., for Orders to carry out electric lighting in Dungannon. A point advanced against the Gas Co. was that it reduced its prices from the time the U.D.C. applied foran Order to light the town electrically.

An application has been made by Basingstoke T.C. for a loan of £12 785 for an 800 kW Diesel alternator set, and a 500 kW motor-generator set, with transformer, switchgear, etc. The Council is also to obtain tenders for another set of plant of similar capacity, to enable the Corporation to consider the advisability of replacing the three 150 H.P. Diesel engine generator sets at present in the station.

It has been decided by Hull Streets Committee that Savile Street be lighted with 750 W gasfilled lamps, and that in cases where separate standards are to be fixed they be supplied by the committee. The City Electrical Engineer quoted £20 per 1 000 W lamp or £15 per 750 W lamp per annum if lamps are fixed on the tramway standards, with an extra £2 per lamp, in either case, if mounted on separate standards.

A Ministry of Transport inquiry has been held in regard to the proposal of the Thames Valley Electric Supply Co. to erect overhead lines on the Sonning estate at Woodley. The application was opposed by Wokingham R.D.C., who said the lines would constitute a danger to the Reading aerodrome. Mr. Spencer Hawes, managing director of the company, said it was not their intention to have high tension wires, but only distributing wires of 230 V.

A report made to the American Institute of Electrical Engineers by sixteen power engineers and electrical research experts, states that lightning now presents the only serious remaining problem to the continuity of electric power service. Of the various instruments available to assist in the fight against the menace of lightning, the hypersensitive cathode-ray oscillograph with its swift-acting electron beam appears to be most in favour. It can be adjusted to show surges lasting only a few millionths of a second and will photograph the wave forms of voltages set in operation by a lightning stroke on an overhead electric wire.

COMPANY NEWS.

Fluctuation of Cables and Wireless Prices—London Power Co.'s Progress—Underground Railways Development Scheme—Directors' Reports and Dividends.

SINCE our last number went to press there has been a temporary recovery in prices of the stocks of Cables and Wireless, Ltd., followed, however, by a reaction which has left the quotations much the same as a week ago. It is suggested in some quarters that the first year's dividend on the 7½ per cent. "A" ordinary stock may not be much above half the maximum figure its name implies. At the end of November this stock stood at over 80, and was not considered over-valued.

Radio Corporation of America shares have been bought, and have risen from 39 to 43¼, approximately the quotation a month ago. American Telephone and Telegraph capital stock has maintained the higher level reached on the recent announcement of the details of the proposed agreement between these two companies. Hydro-Electric Securities have further receded from 43¼ to 42¼, and International Holdings from 5¾ to 5⅜. International Telephone and Telegraph stock has dropped further from $73 to $70, and Marconi International Marine shares have also shed another 1s. 3d. from 45s. to 43s. 9d. Eastern Telegraph 3½% preference stock is a point up at 63½.

In the equipment group, the ten-shilling shares of the National Electric Construction Company have changed hands at 23s., and the price in the official list has been raised 2s. 6d. from 20s. to 22s. 6d. English Electric convertible debenture stock is up a point to 65½. Callender's Cable ordinary shares have risen from 73s. 9d. to 75s., but the 6½% preference have fallen from 25s. to 23s. 9d.; Enfield Cable Works ordinary have improved from 92s. 6d. to 93s. 9d. Ever Ready participating preference shares have shed threepence, from 28s. 9d. to 28s. 6d.

Among the electricity supply companies, Fife 6% preference are marked up from 15s. to 16s. 3d., Metropolitan ordinary shares have improved from just over 38s. to 38s. 9d., and South London from 26s. to 26s. 6d. Clyde Valleys are down from 36s. 3d. to 35s. 7½d., and Lancashire ordinary and first preference from 27s. 6d. to 27s. Whitehall debentures are ½ easier at 103½, and Victoria Falls Power have shed 7½d.

Directors' Reports, etc.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO., LTD.—Fin. div. of 5%, less tax, is announced, making 8% for year.

FIFE ELECTRIC POWER CO.—An applicatn. has been made for a Provisional Order to authorise company to increase issued cap. from £600 000 to £1 000 000 and to issue deb. stk. up to £500 000.

POWER SECURITIES CORPORATION, LTD.—Gross income for 1929, £112 392, agst. £123 159; net rev. £79 424, agst. £85 239; pref. div. £28 000; to res., £20 000, agst. £30 000. Ord. div. 7% (same), less tax. Fwd. £18 293, agst. £14 869.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Stk. div. of 1% is now payable. Shs. comprising the stk. div. will rank for regular cash div. as from March 1. London agents: Canadian and General Finance Co., 3, London Wall Buildings., London,E.C.2.

WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD.—Accts. to Sept. 30, 1929, show pfts. available, after deductg. income tax, £115 519 (includg. £13 227 brt. fwd.). To reserves £30 000, agst. £27 000. Div. 8%, less tax, at 3s. 10¼d., agst. 10%. Fwd. £13 033, agst. £13 227.

YORKSHIRE ELECTRIC POWER CO.—Net pft. for 1929, after paymt. of int. and deb. stk. disct. charges, £341 084, agst. £310 070, plus £78 233, agst. £74 096, brt. in. Directors recommend div. on cum. pref. cap. at rate of 3%, less tax, of which 3% was paid in Aug., and div. of 8%, less tax, on ord. cap., of which 3% was paid in Aug. To gen. res., £100 000. Fwd. £81 413.

METROPOLITAN RAILWAY CO.—A special mtg. of the proprietors will be held on Feb. 20 to consider a Bill to authorise the company to construct new railways, acquire lands, raise further moneys, etc.; and, so far as it relates to the Metropolitan Railway Co., a Bill to authorise certain works to be carried out by the London Electric, Metropolitan District, Central London and City and South London Railway Companies.

ST. JAMES' AND PALL MALL ELECTRIC LIGHT CO., LTD.—Net pft. for 1929, £75 339, plus £112 377 brt. in. Intm. divs. were paid in August last at rate of 8·4d. p. sh. (3½%) on pref. shs. and 9d. p. sh. on ord. shs., leavg. £159 091. It is proposed to pay a div. of 8·4d. p. sh. on pref. shs for second half-year and blce. div. on ord. shs. of 9·949d. p. sh., makg., with intm. div., standard div. for year of 1s. 6·949d. p. sh. To res. (ord. shhldrs' benefit under sliding scale), £22 361; appropriation to co-partners, £4 993; fwd. £100 462.

GERMAN MANUFACTURERS' COMBINE.—Commerz- und Privat Bank announced on Monday the sale to Standard Electrizitaets Gesellschaft of the control of Telephonfabrik Berliner A.G. The reason given for the sale is that the tendency towards concentration in the weak current industry in Germany has made it advisable for Telephonfabrik Berliner to seek connection with a more powerful institution. The Commerz- und Privat Bank will accept delivery of further shares in Telephonfabrik Berliner at the rate of 70%, up to Feb. 28.

NEW CANADIAN INVESTMENT COMPANY.—The European Electric Corporation, Ltd., a public utility holdg. and managemt. company, has been organised under Canadian laws by a group of American, Italian, and Swiss business men. It will be interested in enterprises in Germany, France, Italy, Austria, Spain, Poland, and Greece. Count Giuseppe Volpi, former Italian Minister of Finance, will be president. It is stated that the company will commence operatns. with over $10 000 000 in cash, and that the value of the stocks to be acquired in Italy is over $26 000 000.

CABLES AND WIRELESS, LTD.—The company is sendg. to stkhldrs., who have made inquiries, a reply that it has already been announced that it is not possible for the company to publish its audited blce. sheets and rev. accs. to Dec. 31 in each year until about the followg. Midsummer, owing to the time which must elapse before it can get in the accts. to the close of the year from its branches and subsidiary companies all over the world. The directors cannot give individual stkhldrs. informatn. which they do not give to the general body of stkhldrs., whilst to publish any anticipatn. of results, based on incomplete data, would be undesirable.

BRISTOL TRAMWAYS AND CARRIAGE CO., LTD.—Rev. for 1929, £1 199 554, workg. and general exes. and renewals, £1 043 817, leavg., with blce. brt. fwd. net rev. of £167 352 9s. 9d. After payg. int. for year on 4% mtge. deb. stk. and deposits, and bank and other int., div. on the 4% pref. shs., and intm. div. on ord. shs. at 4%, absorbg. £93 075, it is now proposed to pay fin. div. on ord. shs. at 6% (makg. 10% for year), and to add to res. for contingencies and renewals, £10 000, leavg. £4 278 to carry fwd. With the addition of £10 000 now proposed, res. fund will total £433 002. Receipts of tramways dept. show decrease £3 296, and those of carriage dept. increase of £46 551. The number of passengers carried in the company's cars and motor buses was 117 838 722, compared with 112 168 239 in previous year. Option of Bristol Corporation to purchase company's tramways undertakg. again occurred during past year, but was not exercised, and does not now recur for a further seven years.

Company Meetings.

HALL TELEPHONE ACCESSORIES (1928), LTD.—Major O. M. Guest, presiding at the meeting on Monday, said a substantial sum had been expended on an additional building to cope with the growth of the business. The gross profit from trading was £61 996, after providing about £1 000 as a bonus to the staff and employees. The total volume of the company's business had been considerably increased, and the net profits amounted to £40 365, compared with £30 094 for the previous year. In July last an interim dividend of 4% (less tax), was paid, and the directors now recommended the payment of a final dividend of 6%, less tax, with a bonus of 2%, making a total distribution of 12%, less tax, for the year. During the year under review important contracts from several new customers had been received for types of automatic vending machinery other than the telephone coin collectors and stamp vending machines which they supplied to the British Post Office and to other Governments and concessionaires. The general growth of the business compelled the directors to consider another increase in the company's capacity. It was for this reason that, at the extraordinary general meeting which would follow that meeting, they would ask the shareholders to authorise the increase of the company's capital up to 500 000 shares of 10s. each and to issue 42 000 new shares by the offer to shareholders of one new share at the price of 11s. for every eight shares now held. The report was adopted and the resolutions to increase the capital were carried.

LONDON POWER CO., LTD.—Mr. W. F. Fladgate, presiding at the general meeting last Friday, said capital expenditure during 1929 had amounted to £1 586 000, the greater part of which had been expended upon the completion of the first section of the Deptford West station, which was now in operation, and had proved to be most economical in working. A considerable amount had also been expended on the Battersea station and the completion of the 22 000 V mains. The company was, by its constitution, precluded from making any profit, so the criterion of their success was diminution in cost, and this had been most satisfactory. The output had increased 23·46% over 1928, and amounted to some 733 000 000 kWh, a total only exceeded in this country by the associated group of power companies operating on the North-East Coast of England. Operating cost per kWh for 1928 averaged 0·278d. For 1929 this figure was reduced to 0·240d. The saving in money which this reduction represented to the companies was £675 000, taking the year 1924 as the datum. The control room at Horseferry Road had been completed, enabling the staff at that centre to control the whole of the stations of the company. Progress had been made with the foundations and river work for the Battersea station. It was no exaggeration to say that it was the aim of all concerned to make this station the last word in efficient power stations, as it would form one of the most important links in the chain of stations dealing with the generation of electricity in the southern district of England. The report and accounts were adopted.

SINGAPORE TRACTION CO., LTD.—Mr. L. W. Hawkins, presiding at the meeting last week, said the statements in the report showed a continuation of the progress which had characterised the company's undertaking since the effects of the boycott of 1927 began to pass away. They had run more car miles and carried more passengers in a greater number of vehicles than ever before, and, so far as the current year was concerned, the same tendency was maintained. They could not escape the adverse effect of the prevailing depression in the markets for rubber and tin, which, so long as it lasted, was bound to affect the prosperity of Singapore and reduce the spending power of its population. They did not escape its effect in the past year, and it was a healthy sign that, in spite of it, the travelling public availed itself as largely as it did of the additional carrying capacity which was provided by the company. The profit for the year showed an increase of £13 840, and the allocations made permitted of the division of £28 000 in equal shares between the preference shareholders and the managers, and of the addition of some £800 to the

Digitized by Google

balance carried forward. The preference shareholders thus got for the first time a full year's dividend, which must, however, be regarded as on account of arrears, which would remain at 11% after payment of the dividend now recommended. This meant that holders of the old company's debenture stock who still held the shares allotted in exchange for it would receive £4 18s. in dividend on 70 preference shares, as against the £5 which was due, but for many years unpaid, on £100 of old debenture stock. The 70 preference shares and the 40 ordinary shares which went with them in exchange for £100 debenture stock had together a market value of approximately £90. The report was adopted.

UNDERGROUND GROUP.—Special general meetings of proprietors of the underground railways of London, on February 6th, approved the Bills now before Parliament empowering the companies to carry out improvements and extensions. Lord Ashfield, who presided, pointed out that the companies could not contemplate the carrying out of their improvements and extensions unless they received adequate assistance by way of grant from the Treasury, The major work for which the London Electric Railway Co. sought powers was the extension of the Piccadilly section from Finsbury Park to Cockfosters. Another important development was through Hammersmith to Northfields on the Piccadilly line. It was proposed to connect with a disused Southern Railway line at Ravenscourt Park. Escalators and other station improvements were proposed at King's Cross, Hyde Park Corner, Knightsbridge, Dover Street, and Russell Square. It was proposed to remove the Dover Street Station to the corner of Green Park, near the Ritz Hotel, and to reconstruct Knightsbridge Station, with surface stations in Brompton Road and the top of Sloane Street. One of their problems was the "speeding up" of the whole system. This could not be done while stations were situated closely together, involving frequent stops. The Metropolitan District Railway were seeking powers to widen the line from Ravenscourt Park to Northfields and to reconstruct the stations at Turnham Green, Chiswick Park, Acton Town, South Ealing, Northfields, Hounslow East, and Hounslow West. The construction of four lines west to Hammersmith would greatly accelerate services to Hounslow, Ealing, and Uxbridge. On the Central London Railway it was proposed to build a new station at Marble Arch, with escalators. The present interchange at British Museum with the Holborn station was unsatisfactory, and it was proposed to construct a new deep level station. The City and South London Railway were seeking powers to construct a subway connecting the Bank station with the Monument station. The estimated cost of the whole scheme for which powers were sought in the Bills was approximately £12 000 000, of which extensions would account for £8 000 000.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

309 401 Wico Electric Co. Magnetos. (9/4/28.)
320 992 O. G. Culverwell. Devices for the electrical treatment of poultry. (24/8/28.)
320 993 D. N. Sharma. Television system incorporating transmitting and receiving apparatus with cathode rays. (24/8/28.)
296 781 Westinghouse Lamp Co. Method of introducing highly-active metals into sealed containers. (9/9/27.)
320 999 J. S. Shinton. Television. (28/8/28.)
321 003 J. Harden. Mercury lamps. (4/9/28.)
321 006 Drysdale and Co., Ltd., and J. Young. Electrical heating and mixing apparatus. (10/9/28.)
296 996 Akt.-Ges. Brown, Boveri et Cie. Transformers for use in rectifier installations. (10/9/27.)
321 025 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Method of and arrangements for transmitting wireless signals. (26/9/28.)
321 032 E. R. Grote. Tubular electric incandescent lamps. (1/10/28.)
321 037 W. Holt. Thermionic valves or vacuum electric devices. (4/10/28.)
321 039 T. J. Digby and A. O. Gibbons. Apparatus for projecting light. (5/10/18.)
321 043 S. F. Warren. Combined television and sound-reproducing apparatus. (12/10/28.)
299 325 Telefunken Ges. fur Drahtlose Telegraphie. Thermionic valves. (21/10/27.)
321 052 Coventry Automatic Telephones, Ltd., and E. P. L. Westell. Devices for the generation of audio-frequency electric currents. (23/10/28.)
299 784 Siemens and Halske Akt.-Ges. Graphite and depolariser plates for galvanic cells. (31/10/27.)
299 886 Siemens-Schuckertwerke Akt.-Ges. Polyphase asynchronous motors. (4/11/27.)
321 065 S. Thompson. Electrical heating-device. (7/11/28.)
301 827 Telefunken Ges. fur Drahtlose Telegraphie. Thermionic valves and the like discharge devices. (6/12/27.)
301 041 British Thomson-Houston Co., Ltd. Wire-feeding mechanism for weiding machines. (23/11/27.)
301 389 General Electric Co., Ltd. Manufacture of electric incandescent lamps or the like. (28/11/27.)
316 536 Dr. A. Just. Cathodes for electron-discharge devices. (30/7/28.)
301 332 S. K. Olsen [trading as L. Poulsen and Co.]. Reflector arrangement for incandescent lamps. (21/11/27.)
321 083 P. Locori. Cable projectiles with parachute, to be fired against aircraft. (30/11/28.)
301 833 British Thomson-Houston Co., Ltd. Refrigerating-machines. (6/12/27.)
321 088 W. Brown. Fluid-filled paper-insulated electrical cables. (7/12/28.)
302 917 G. Main. Incandescent electric lamps. (23/12/27.)
321 104 A. Carpmael (Telefunken Ges. fur Drahtlose Telegraphie). Picture and the like telegraph systems. (22/12/28.)
303 450 A. Stuppock and G. Hager. Electric switches. (3/1/28.)
303 860 International General Electric Co., Inc. Safety devices for steam-power installations. (11/1/28.)
315 384 Magneto Belge. Electric motors. (13/7/28.)
316 281 J. G. Daloz. Miners' electric lamps. (27/7/28.)
321 118 St. Helen's Cable and Rubber Co., Ltd., and H. C. Harrison. Twin and multi-core electric cables. (16/1/29.)
305 039 International General Electric Co., Inc. Steam plants employing intermediate superheating. (28/1/28.)
321 124 W. D. Verschoyle. Electric lamps for the production of ultra-violet rays. (6/2/29.)
307 340 F. Merk. Relay and selector arrangement in telephone installations. (5/3/28.)
307 826 Telefunken Ges. fur Drahtlose Telegraphie. Electric discharge devices. (14/3/28.)
306 099 British Thomson-Houston Co., Ltd. Dynamo-electric machines. (15/2/28.)
320 909 J. L. Baird and Television, Ltd. Television apparatus. (25/4/28.)

COMING EVBNTS.

Friday, February 14th (To-day).

Incorporated Society of British Advertisers.—Hotel Cecil, Strand, London. Luncheon meeting of the Engineering Section. Speaker, Mr. E. E. Sharp on "Lessons from a Business Tour in Australia and New Zealand." 12.40 *for* 1 *p.m.*

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Paper by Mr. F. D. Smith on "The Magnetostriction Constant for Alternating Magnetic Fields." 5 *p.m.*

Saturday, February 15th.

Association of Mining Electrical Engineers (South Wales Branch).—South Wales Institute of Engineers, Park Place. Paper by Mr. W. A. Hutchings on "Safety and Efficiency in Mines." 6 *p.m.*

Monday, February 17th-Friday, February 28th.

British Industries Fair.—London and Birmingham.

Monday, February 17th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "The Nickel-Iron Battery and its Uses" (Opened by Mr. M. E. Fox and Mr. W. E. Warrilow), and "The Lead Battery and its Uses" (Opened by Mr. E. C. McKinnon). 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales—Liverpool—Centre).—The University, Liverpool. Faraday lecture by Capt. P. P. Eckersley on "Broadcasting by Electric Waves." 7.30 *p.m.*

Institute of Wireless Technology.—Engineers' Club, Coventry Street, London. Discussion on "Aerial Design for Short Wave Transmission." 7.30 *p.m.*

Electrical Association for Women (Bristol and District Branch).—Lecture on "Colour Lighting for Home Decoration," with experimental demonstrations by Mr. L. E. Buckell. 8 *p.m.*

Tuesday, February 18th.

Royal Institution.—21, Albemarle Street, London. Lecture by Sir William Bragg on "X-Ray Determination of the Structure of Cellulose." 5.15 *p.m.*

Illuminating Engineering Society.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Paper by Mr. W. H. Villiers on "Modern Incandescent Lighting in Kinema Studios." 6.30 *p.m*

Institution of Heating and Ventilating Engineers (Associate Members and Graduates Section, Manchester and District Branch).—Milton Hall, Deansgate, Manchester. Paper by Mr. F. C. Lant on "Kitchen Equipment." 7 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Paper by Messrs. J. G. Wellings and C. G. Mayo on "Instrument Transformers." 7 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Lecture by Mr. F. Selly on "H.T. Heating of Water and its Application to Large Buildings." 7.15 *p.m.*

Paisley Association of Electrical Engineers.—39, High Street, Paisley. Lecture by Mr. W. M'Gregor on "Modern Electrical Equipment of Cinemas." 7.30 *p.m.*

Wednesday, February 19th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.

Electrical Development Association (North-West Area).—Demonstration Bureau, 1, Fountain Street, Manchester. Conference on "Personal Salesmanship in the Electrical Industry." 6.30 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel, Sheffield. Address by the President, Col. Sir T. F. Purves. 7.30 *p.m.*

Institution of Electrical Engineers (Scottish Centre, Students' Section).—Royal Technical College, George Street, Glasgow. Lecture by Lt.-Col. H. E. O'Brien on "Electric Traction." 7.30 *p.m.*

Thursday, February 20th

Institution of Electrical Engineers (Hampshire Sub-Centre).—Portsmouth. Conversazione. 7.30 *p.m.*

Institution of Electrical Engineers (Irish Centre, Dublin).—Physical Laboratory, Trinity College. Paper by Messrs. B. A. G. Churcher and A. J. King on "The Analysis and Measurement of the Noise Emitted by Machinery." 7.45 *p.m.*

Friday, February 21st.

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. S. H. Hart on "Paper-Insulated Power Cables." 6.15 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, Strand, London. Conference on "The Electrical Industry and the Architect." Speaker, Mr. C. H. Flower. 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster. Paper by Mr. E. P. S. Gardner on "The Application of Electric Welding to the Erection and Strengthening of Steel Structures." 7.30 *p.m.*

Saturday, February 22nd.

Association of Supervising Electrical Engineers.—Hotel Cecil, Strand, London. Annual dinner.

Telephone Progress.

IF the telephone is even to-day less used in Great Britain than in North America and in some European countries, it is none the less true that great development has taken place in this country since the war. A statement on progress in the London area during 1929, prepared by the Controller of the London Telephone Service and the Superintending Engineer of the London Engineering District, primarily for the London Telephone Advisory Committee, points out that the number of direct exchange lines in the London area has grown from 181 606 in December, 1921, to 384 739 at the end of last year—an expansion of over 110% in eight years. The total number of telephones (exchange and private) at the end of 1929 was 661 977, an increase of 47 794, or 7·8% on the year. There are now 137 exchanges in the area, seven having been added during 1929. Of these exchanges 24 are automatic. The memorandum remarks that neither the use of long-distance trunks by trade representatives, nor the use of local lines for shopping and similar purposes, is nearly as great here as in America and elsewhere. This is no doubt partly due to the higher cost in this country, and partly to the need for more extensive propaganda. The two diagrams issued by the Swedish Post Office, which were reproduced in our issue of February 7th, certainly suggested that the cost factor is far from negligible. There are features of the system of charging for telephone connections in Great Britain which are not altogether calculated to enhance their popularity or use. Among such are the refusal to admit the possibility of error in the recording of calls and the demand for a larger deposit when the number of calls originated by a subscriber exceeds certain limits.

In this connection it is important to draw a distinction between the commercial and the technical departments of the Post Office. That institution commands the services of a remarkable body of very competent engineers, but on the commercial side it suffers from most of the vices inherent in Government departments engaged in trading operations. All comparisons between the use of the telephone and telegraph systems in this country and North America must therefore be subject to the qualification that in the one case we are dealing with a Government service and in the other with public companies. Even the work of the purely technical branches of the British Post Office cannot altogether escape the cramping effects which are inherent in State ownership of any public enterprise. The ability of individuals is not in question, but they are subject to limitations which do not apply to their "opposite numbers" on the other side of the Atlantic.

Undoubtedly the most remarkable development of telephony in recent years is the extension of long distance radio-telephonic facilities. Four channels are now working throughout the 24 hours between Europe and North Africa on the one hand and North America on the other, all traffic passing through London. As many as 140 calls have been passed over the Atlantic in a single day. There are also services by alternative routes between London and Buenos Aires. Last week we recorded a successful Marconi beam transmission between London and Japan, and it can now be said that radio-telephony between the most widely separated points on this planet is technically feasible, though not throughout the whole of each day. For the moment the establishment of regular radio-telephone services between London and the Dominions in the Southern Hemisphere and India appears to be awaiting a delimitation of the respective spheres of the Post Office and the I. and I.C. Company. Until the Cabinet Committee, which is looking into this matter, has made its report these valuable extensions of Imperial communications will remain in abeyance. But this state of affairs cannot long delay the establishment of direct vocal intercourse between all the more important units of the Empire—an immense step forward in the task of linking its peoples more closely together.

Current Topics.

Coal Bill—Another Protest.

FURTHER consideration of the Coal Mines Bill, which had already been the subject of protests by the Federation of British Industries, has not removed that organisation's objections to the policy embodied in the Bill. Its opposition is now expressed to the proposals for compulsory amalgamation as well as to Part I of the Bill, dealing with marketing schemes. The F.B.I. points out that, although successful amalgamation depends upon exceptional ability, long experience and a careful selection of units to be amalgamated, the Government's proposal provides that where intimate knowledge and long experience have decided against amalgamation a Commission of three men can override such a decision without appeal. In the circumstances not only the F.B.I. but the country as a whole has reasons to fear that the Government's proposals " will saddle the country with a number of ill-assorted and unwieldy conglomerations whose inefficient operation and ultimate collapse will merely cause loss to the shareholder and unnecessary cost and inconvenience to the consumer of coal."

Taxation and the Budget.

IN a further communication the F.B.I. expresses serious concern at the increasing burden of taxation upon productive enterprise. The Federation describes the Budget outlook as " extremely grave " and points out that British industry has been struggling for nearly a decade to recover its position, handicapped by a load of taxation which not only far exceeds that of any important commercial country but now finds itself faced with the certain prospect of additional taxation. We have already expressed a similar view as to the disastrous consequences of an attempt to increase the burden of taxation in the forthcoming Budget in order to finance unproductive schemes or augment doles and pensions. The difficulties of the present period of readjustment will be greatly accentuated and recovery delayed unless the Government will set its face like flint against any policies involving further public expenditure involving fresh taxation.

Electrical Overseas Trade.

THOUGH the general export figures during January showed a decline, shipments of electrical goods, apparatus and machinery from the United Kingdom amounted to £2 245 057, as against £1 614 301 during January, 1929, an improvement of £630 750, and an increase on the December, 1929, figures of £533 179. The largest shipments of machinery were destined for countries in Europe, the total value exported being £141 626. India accepted £88 238, Australia £79 620, and South Africa £69 660. By comparison with last year, exports of submarine cables improved by £8 279, wires and cables other than rubber insulated by £55 509, and telegraph and telephone instruments by £83 183. Imports of electrical goods, apparatus and machinery during January last were valued at £912 228, or £314 133 more than during January, 1929, and an increase on the December total of £685. Imports of electrical machinery increased by comparison by £21 697 ; the largest increase, however, was recorded under electrical instruments, with an advance of £204 792. Wires and cables other than rubber insulated also increased during the month under review, the return by comparison with January, 1929, showing an advance of £24 151. Telephone and telegraph instruments, which usually show an increased amount, declined, however, by £11 893. It is interesting to note that this increase in electrical export trade is recorded during the month preceding the opening of the British Industries Fair, when manufacturers may reasonably expect a slowing up of business pending the examination by overseas buyers of all that is new and best in Britain's shop windows. Further, as mentioned in our last issue, the home demand is improving, thus bringing about a better balance between the home and export figures. The electrical industry has begun the new year well and with the B.I.F. to help, the February returns should be even more encouraging.

Parsimony in Lighting.

INSPECTION of a number of New England factories by a party of American editors caused them to report that " the lighting of New England factories appeared to us to be distressingly bad, despite a few examples of the most advanced industrial illumination." Great floors of machinery were common, " spotted only with dirty lamps in inefficient or improvised reflectors at the tool, supported by no adequate general illumination. With this dark halls and stairways came as a matter of course." There is no doubt that far too many factories and offices in this country are equally open to condemnation for similar faults, and in many post offices the lighting is atrocious. Bad lighting is false economy of the most shortsighted kind. As the American editors point out in their report, it " takes an inevitable toll in accidents, low speed, and spoiling of materials," not to mention the damage to eyesight and consequent impairment of the workers concerned. We are glad to see that a third edition of the Home Office Welfare Pamphlet No. 7, dealing with lighting in factories and workshops, has just been issued.

Life of Flashing Sign Lamps.

IT has been thought that the constant switching off and on of lamps used for flashing advertisement signs shortened the life of these lamps. Records kept for three years in an American city relating to 4 249 lamps fitted in a large sign of this type indicate that the reverse is true, according to the New Jersey Public Utility Information Committee. The sign which was kept under observation contains 2 992 lamps which burn continuously and 1 257 lamps which flash eight times a minute, the current passing for half the time. Fewer replacements were required in the case of the flashing lamps. It would seem that the short intervening periods of rest more than compensated for any damage done to the filament by the rapid switching on and off of current.

N.-E. Coast Engineering Museum.

ON behalf of the engineering industries of the area, the North-East Coast Institution of Engineers and Shipbuilders has forwarded a memorandum to the Lord Mayor of Newcastle-on-Tyne, urging that he appoint a representative committee with the object of establishing an engineering museum. Suggested exhibits of electrical interest are a collection of electric lamps illustrating development since the days of SWAN, which are in the possession of Mr. J. H. HOLMES. We hope that the plan will receive sufficient support to enable it to be carried out in a manner worthy of a district that is one of the cradles of engineering.

EXTENSIONS TO LEICESTER CENTRAL GENERATING STATION.

New 25 000 kW Turbo-Generator and Pulverised Fuel Plant Opened—Growth of Demand for Current—Description of the New Installation.

SIR Andrew Duncan, chairman of the Central Electricity Board, opened the large extensions to the Leicester Central generating station on Wednesday.

Those present at the opening ceremony included the Lord Mayor, Coun. W. E. Hincks, the Bishop of Leicester, Coun. A. H. Swain, chairman of the Electricity Committee, Mr. V. Watlington, Sir A. Page, Mr. F. W. Purse, Capt. J. M. Donaldson, Sir W. Rolleston, Mr. T. P. Wilmhurst and Lt.-Col. W. A. Vignoles.

At a luncheon held at the Grand Hotel, Coun. Swain presiding, Sir Andrew Duncan proposed the toast of " The Leicester Electricity Undertaking " and said it was realised to-day that production of electricity must be on a rationalised basis. Industry had enough to do to find capital for its own business, and apart from exceptional cases, private plants should be discouraged.

Coun. Swain said when additional plant for which provision had been made in the new buildings was added, the total cost would be £10 6s. per kW of plant, against an average of £21 4s. for the United Kingdom.

Mr. John Mould, the chief engineer, said that the Leicester station burnt the worst coal in the country, but it stood in thermal efficiency at the head of all the large stations burning bad coal.

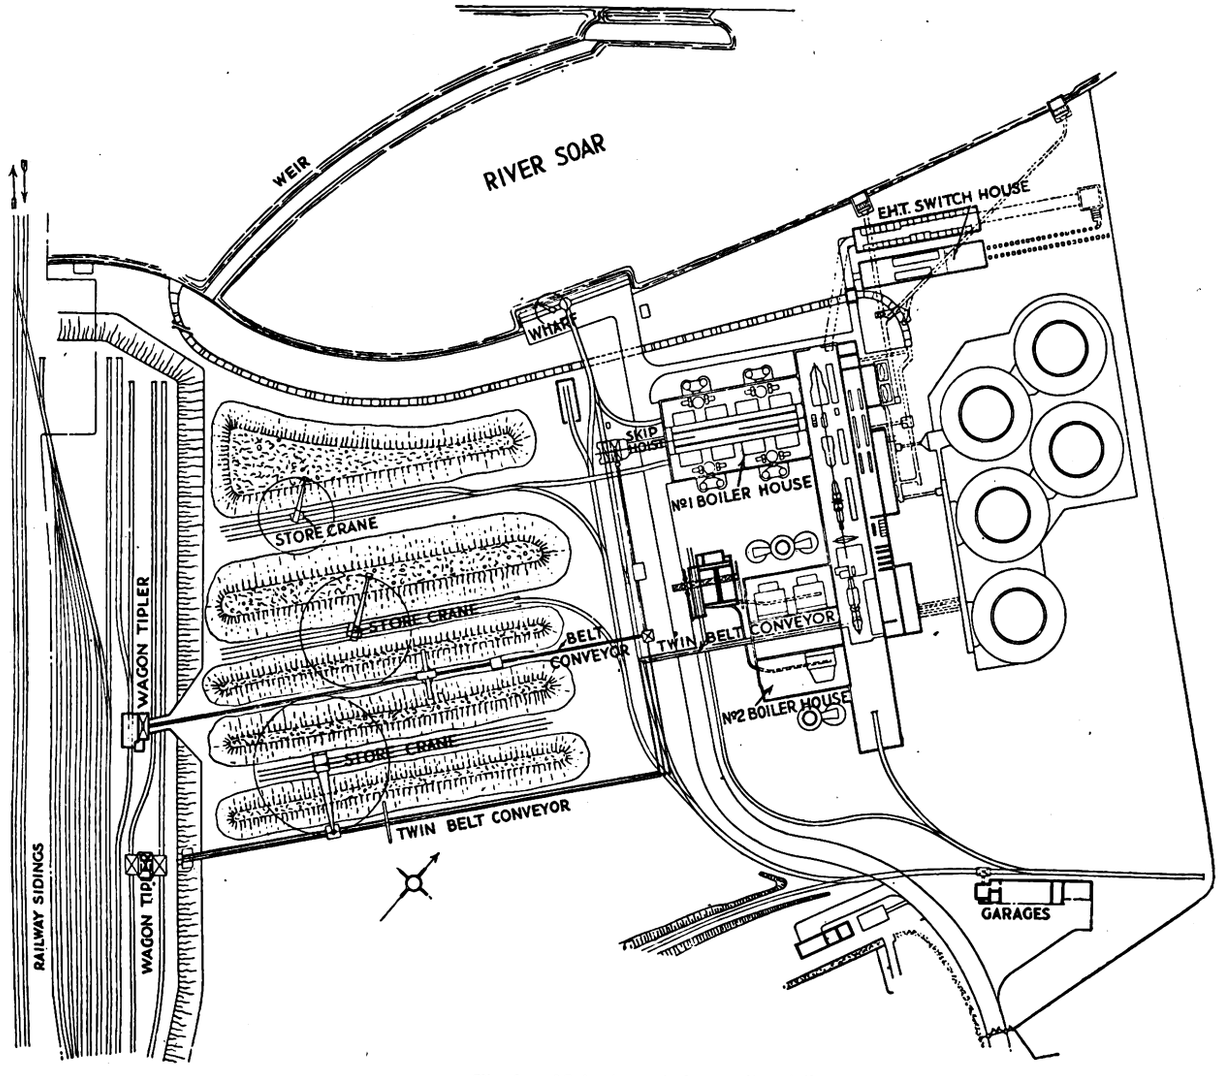
The Central generating station at Leicester, constructed on a site permitting extensions sufficient to cope with any increase in demand that can be reasonably anticipated for many years to come, was opened in 1922 and has since supplied practically all of the current consumed in the area administered by the City Electricity Committee. The present extension increases the capacity of the Central generating station to such an extent that it will in future be able to deal with the whole area of supply, and it is probable that the Lero and Aylestone plants will no longer be required as generating stations after March 31st, 1930. The following figures indicate the rapid growth of the Leicester electricity department since the war :—

Year.	Number of Consumers' Meters Working.	Units sold.
1920	7 720 ..	25¼ millions.
1925	19 871 ..	42 ,,
1928–9	36 999 ..	60 ,,

The total number of units generated during the nine months ended December 31st, 1929, amounted to 56½ millions.

The area of supply embraces 30 281 acres, and includes 21 parishes outside the city boundaries. To transmit electric current over this large area requires 500 miles of cables, while 6 primary and 254 secondary sub-stations have been erected.

When completed, the new section of the station will contain four water-tube boilers, two 25 000 kW generating sets, two house service turbo-generator sets of 1 500 kW each, with the necessary switchgear and other accessories. The buildings required to house all the ultimate equipment have now been constructed, but at present only one main and one house generating set are installed. Three boilers have also been constructed and are in operation. The contract was placed



Site plan of Leicester central generating station.

Digitized by Google

in April, 1928, and was divided into sections. The supply of the main electrical generating equipment was entrusted to the English Electric Co., Ltd., of Rugby, the house service set to the Oerlikon Co., Ltd., of Zurich, and the switchgear to Ferguson, Pailin, Ltd., Manchester. The civil works, comprising the necessary buildings with the coal handling and ash disposal plants, were placed with the Mitchell Conveyor and Transporter Co., Ltd., of London, while International Combustion, Ltd., were responsible for the design and construction of the steam generating plant. To secure adequate co-ordination the International Combustion, Ltd., were appointed main contractors. All designs and progress of work have been carried out under the direct supervision of Mr. John Mould, Engineer and Manager of the Leicester City Electricity Department.

It is hoped that the advantages attaching to the combustion of coal in a pulverised form, and the extensive application of the principles of regenerative feed heating in connection with the turbo-generators, will be justified by a substantial reduction in generating costs.

The structural additions now completed include a new boiler house large enough to accommodate four boilers, an extension to the engine room, with provision for the installation of two 25 000 kW turbo-generator sets, and extensions to the switch-house buildings to house the additional switchgear

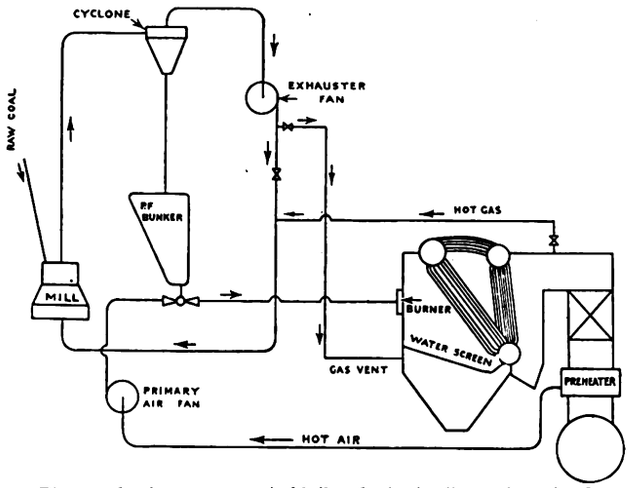


Diagram showing arrangement of boilers, heat extraction equipment and pulverising plant, No. 2 boiler house.

required. The buildings are steelwork structures with walls of brick panelling and roof coverings of slating and patent glazing. Particular attention has been directed to securing the largest measure of natural lighting.

The new boiler house is some 95 feet long, 130 feet wide, and 107 feet high from basement to apex of roof, arranged at right angles to the engine room. The engine room has been extended by 202 feet, making its present dimensions 430 feet long by 46 feet wide, and 69 feet high, so that it provides accommodation for a further turbo-generator set in addition to the machine at present installed.

New buildings, forming the control room, pump house and offices, have also been erected, parallel to the engine room, and a new structure in a remote part of the site houses the high tension switchgear.

The steam raising plant installed in the new extension comprises three watertube boilers, each capable of maintaining continuously an evaporation of 150 000 lb. of steam per hour, while an evaporation of 180 000 lb. per hour is obtainable under overload conditions. Provision has been made for the addition of a fourth boiler when the station is completed. The steam generating equipment is designed to operate normally with Leicestershire slack containing a high percentage of moisture and ash. The pulverised fuel system installed is the Lopulco Central System, in which powdered coal is delivered by the mills to a series of storage bins from which the boilers draw their supply. Conveyors are provided to distribute the product of each mill over all the bins and consequently the mills and boilers are completely interconnected. Four raw coal bunkers, having a total capacity of 1 820 tons, occupy the full width of the boiler house under the lantern roof and are supplied by two belt conveyors. The powdered product from the pulverising mills is stored in four pulverised fuel bins each of 45 tons capacity suspended from the firing floor. The amount of coal supplied to the boilers is measured by automatic coal weighers.

The coal handling plant has been extended to provide the additional capacity necessary to deal with the increased quantity of coal consumed, and to transport fuel to the new boiler house by the addition of two further "Mitchell" type weighing tipplers which are electrically controlled.

The pulverising equipment associated with each boiler comprises a mill, a cyclone separator and an exhauster fan, with a suitable system of piping connecting the component parts. The pulverisers are of the six-roller Raymond Super Mill Type, each being capable of dealing with approximately 15 tons of coal per hour and grinding it to a degree of fineness suitable for supplying the burners without further treatment.

Each boiler is fired by three Lopulco turbulent type "R" burners, which together are capable of delivering over 9 tons of coal to the furnace per hour. The burners are supplied by three sets of Duplex Feeders fitted at the bottom of the adjacent pulverised fuel bin. Of the three boilers comprising the present installation, two are of the vertical, bent-tube, three-drum type, erected above Lopulco water-cooled combustion chambers, and the third is of a special design developed by International Combustion, Ltd., for operation with pulverised fuel. The boilers are equipped with M.L.S. type superheaters and designed to give a pressure of 350 lb. per square inch and a total temperature of 750° F. at the turbine stop value. The air preheaters on the vertical tube boilers are of the Howden Ljungstrom regenerative type. On the Lopulco boiler an Usco plate type preheater is installed. A vacuum dust extraction plant has been provided for the purpose of removing grit deposited at those portions of the boilers and associated equipment where the accumulation of dust is likely to occur. The system provided for removing ashes from the boilers and ultimately from the site, is of the sluicing type. The system operates automatically and continuously, and very little manual labour is involved.

The main bulk of the feed water supplied to the boilers is provided by the condensate from the turbo-generator. To compensate for unavoidable losses a certain amount of additional water is required to make up the feed water supply. As this is obtained from a well sunk on the site, an evaporating plant has been installed to remove impurities. The evaporating plant is capable of supplying a total output of 1 000 gallons of pure water per hour at a temperature of 210° F. using 1 650 lb. of live boiler steam in the process, the latter being recovered as distillate.

All the auxiliary equipment including mills, fans, feeders, and so on, is electrically driven, the starters being located close to the motors, while control panels are grouped together on a platform raised above the operating floor in the centre of the building. The boilers are fully equipped with indicating and recording instruments, enabling the operation of the boilers to be adjusted to give maximum efficiency under all conditions of load. The plant is equipped with Bailey Automatic Control apparatus. The boilers may also be manually controlled by the aid of Bailey boiler meters. The amount of feed water supplied to each boiler is measured by a Kent Venturi Meter, while further meters of a similar design are installed in the two main feed ranges. Additional instruments provided on each boiler include a Multi-Pointer Draught Gauge, a CO_2 Recorder and a number of distance thermometers and pyrometers.

Electrical Equipment.

The main generating plant at present provided consists of a turbo-alternator having a maximum continuous rating of 25 000 kW at 0·8 power factor, generating three-phase alternating current at 6 600 V and 50 cycles per second when driven at a speed of 3 000 r.p.m. Its most economical load, however, is 20 000 kW. An exciter running at a speed of 1 500 r.p.m. is directly coupled to the alternator through reduction gear, and its field is provided with a specially graded shunt regulator for controlling the alternator voltage. The alternator is of the completely enclosed type. Cooling is provided by a closed air circuit in which circulation is maintained by a motor driven fan, and the temperature of the air is reduced in passing through a cooler supplied with water from the condenser circulating system. An alarm device is connected to the air cooler. Thermo-couples arranged in the stator indicate the temperature on a dial mounted in the control room.

The alternator is direct-coupled to a two cylinder impulse-reaction turbine embodying solid steel rotors. The high

(*Continued on page* 224.)

Digitized by Google

Digitized by Google

pressure cylinder has built-up steel diaphragms, and is arranged for single flow. The low pressure cylinder is of the double flow type discharging into twin condensers. At normal load the turbine is designed to operate with steam at 350 lb. per sq. in and 750° F., while a vacuum of 28·45 inches of mercury is maintained at the exhaust flange. The maximum continuous rating of the set can be obtained when the temperature falls to 700 deg. F., the vacuum being then at least 28 inches. An automatic governor controls the speed of the turbine.

The condensers are of the two-pass, surface type, having brass tubes and tube-plates, and casings built up of welded steel plates, the total cooling surface being 23,000 square feet. The cooling water is drawn from a battery of cooling towers and is circulated through the condensers by means of two motor driven pumps each capable of supplying 26 800 gallons per minute. Duplicate Pervac extraction pumps remove the condensate from the condenser and deliver it to a closed feed heating system. Two surface type air ejectors, one designed to operate when the turbo-generator is on full normal load, and the other at maximum continuous rating, remove vapour from the condenser.

Three feed water heaters are installed in the basement of the engine room and each is supplied with steam bled from the main turbine at a stage where a suitable temperature and pressure are present. After leaving the extraction pumps the condensate passes through the first two heaters to two electrically driven boiler feed pumps which discharge it to the third bled steam heater of the high pressure type. A bye-pass is provided round each heater so that the system can operate while a unit is under examination or repair. The condensate main is connected to elevated surge tanks accommodated with the evaporated and town water tanks in a chamber above the switchgear control room. All the tanks are fitted with electrically operated level indicators installed in the engine room. An emergency steam turbine-driven pump is installed in the boiler house, taking its supply from the town water tank.

To provide current for the motors driving auxiliary plant an Oerlikon turbo-generator set having a maximum continuous rating of 1 500 kW has been installed in the engine room. The generator delivers alternating current normally at a pressure of 415 V and 50 cycles, but a voltage regulator enables the terminal pressure to be varied between 380 and 440 V. The machine is provided with a direct-coupled exciter, while the pressure is kept constant by means of a Tirrill voltage regulator. Air cooling arrangements similar to those of the main alternator are provided on the house set. Alarm and safety devices are fitted on the stator as on the main alternator. The alternator is coupled to a pure impulse type turbine designed for the same working conditions as the main alternator. The turbine is a single cylinder machine with a cast steel steam chest, and the governor, in addition to operating the main throttle valve, automatically controls auxiliary valves regulating the nozzle area of the first stage, according to the load. The turbine is provided with an air cooler arranged similar to that of the main machine, and arrangements are made for filtering the oil of both machines without intermixture through a common filter.

In addition to the temperature indicators on the main and house generator sets, and the level indicators on the tanks already mentioned, the most important instruments provided for indicating to the operators the performance of the equipment in the engine room include Venturi meters on the condensate pump discharges, and steam flow meters on the steam jet air ejectors, for both generator sets, the former embodying indicating, recording, and integrating mechanisms.

Three new cooling towers have now been provided to augment the two that previously served the original installation, so that the present battery comprises five towers all of similar design and capacity. The three new towers together are capable of cooling over 2 million gallons of water per hour through 12° F., and the outlet temperature will not exceed 74° F. under normal atmospheric conditions. The towers are of a special design developed by L. G. Mouchell and Partners, Ltd., and consist of external reinforced concrete shells about 125 feet high above pond level and 96 feet diameter at the base supported by diagonal columns of circular section. By a suitable system of sluice valves, it is possible to isolate any individual tower for inspection and repair.

The extra high tension busbars of the station are divided into four main sections, which are inter-connected by means of suitable re-actors with a tie bar, and with a reserve busbar. The contract for e.h.t. switchgear was placed with Messrs. Ferguson, Pailin, Ltd., and comprised one generator control equipment, and 15 equipments for the control of feeders, bus-couplers, re-actors, etc. The equipment is of their totally enclosed, metal clad, drop-down H.V.D. 75 type.

Each switch is designed with a rupturing capacity of 750 000 kVA, and is capable of handling any fault that can come on to the station. This gear is accommodated in an entirely new switch-house building remote from the station itself.

ILLUMINATING ENGINEERING SOCIETY.

Annual Dinner and Dance at Prince's Galleries—Coming Incorporation of the Society—Sustained Progress—Membership now Nearly 400.

THE annual dinner of the Illuminating Engineering Society was held at Prince's Galleries on February 12th. Dr. J. W. T. Walsh presided and those present included Col. Sir Thomas Purves, O.B.E. and Lady Purves, Mrs. H. Buckley, Sir Gerald Bellhouse and Lady Bellhouse, Mr. C. C. Paterson, O.B.E., and Mrs. Paterson, Capt. Donaldson, Dr. F. E. Smith, Lt.-Col. K. Edgcumbe, Miss H. M. Martindale, O.B.E., Mr. H. E. Copp, Mr. and Mrs. Thomas Wilkie, Lt.-Col. W. A. Vignoles, D.S.O., and Mrs. Vignoles. The dinner was followed by dancing.

Sir Thomas Purves, whose witty and genial speeches are always much appreciated, proposed the health of the Illuminating Engineering Society. He said that he had only the kindest feelings even for the gas engineers who now and again had their little games with him, injected quantities of their ethereal vapour into his telephone conduits and manholes, and in the friendliest manner blew them up. The Society in its 21 years of existence had, by the high quality of its purpose, placed itself in the front rank of technical societies. It had built up a real science of illumination which made them hope that even London would be a decently lighted place some day. He welcomed the presence of so many ladies.

Dr. Walsh (president of the Society), responding, paid a tribute to the work of the late Mr. Leon Gaster and his wonderful enthusiasm in the cause of illumination as secretary of the Society. The memorial fund had met with great success and had practically reached £250, the amount considered necessary for a memorial worthy of the Society and a fitting commemoration of Mr. Gaster's work.

The Society had now reached a total membership of nearly 400. Growth during the past few years had been such that the Society would be duly incorporated within the next few months. Two successful meetings had been held at Birmingham and the formation of local centres of the Society would follow in the very near future. As long as the Society remained confined to London it could not do the work that it might carry out if it had local centres in other parts of the country. The progress being made was in very large measure due to the indefatigable energy of their secretary, Mr. Dow.

In 1931 we hoped to welcome illuminating engineers from all parts of the globe when the meeting of the International Illumination Association and Illumination Congress would be held. They must all put their backs into the work of making the meeting worthy of the Illumination Movement in Great Britain.

Mr. C. C. Paterson, proposing the toast of "The Guests" said that both the Institution of Gas Engineers and the Institution of Electrical Engineers had always been as elder brothers to the Society if they had not to one another. There had always been a tradition of explosiveness about any combination of gas and electricity but their association in the Society was more in the nature of peaceful diffusion.

Dr. F. E. Smith, who replied, spoke of finding a house at Nyeri in Kenya, 17 miles south of the equator and 5 miles from any other white man's habitation, well lighted with gas-filled electric lamps supplied from accumulators which were recharged once a week.

Mr. H. E. Copp also replied and raised the pæan on behalf of the gas industry. As he was only separated by one place from Lt.-Col. Vignoles many of the company felt that the tradition of explosiveness referred to by a previous speaker might be enhanced, but Mrs. Wilkie, whose husband occupies the neutral position of vice-president of the Association of Public Lighting Engineers, proved to be an efficient insulator.

ELECTRICAL WHOLESALERS' FEDERATION.

The Annual Dinner—Mr. Watlington on Rationalisation—President's Appeal for Co-operation in the Industry.

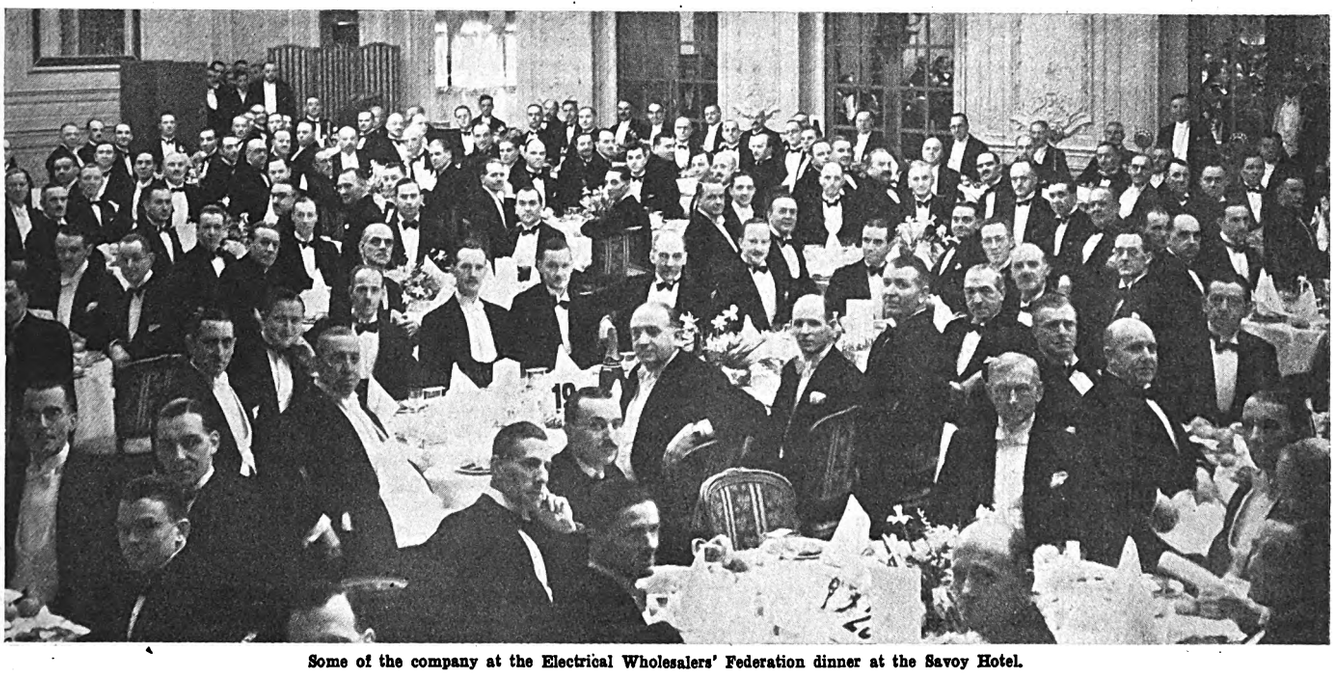
THE annual dinner of the Electrical Wholesalers' Federation was held at the Savoy Hotel on February 13th. Mr. James Wilson, president of the Federation, was in the chair, and the company included :—

Mr. V. Watlington, Sir Felix Pole, Mr. Percy Rosling, Mr. J. K. Brydges, Mr. J. Y. Fletcher, Mr. C. W. Sully, Mr. Willoughby Ellis, Mr. S. H. Callow, Mr. P. F. Crinks, Lt.-Col. W. A. Vignoles, D.S.O., Mr. D. N. Dunlop, Mr. L. B. Atkinson, Mr. P. V. Hunter, Mr. Howard Marryat, Capt. J. W. Barber, C.B.E., Mr. Theodore Stretton, Mr. A. G. Beaver, Mr. F. Winstanley, Mr. T. R. Martin, Mr. H. W. Jarvis and Mr. G. O. Donovan.

Mr. Watlington, proposing the toast of "Rationalisation," gave an outline of the evolution of the ideas embodied in the word in the Ruhr coalfield. He said that if demand was only sufficient to employ say 80 per cent. of the producing plant the final result of the intense competition that took place probably was that everyone ended by getting about 80 per cent. of their capacity but on a much reduced price level. Lowering of prices resulted in a lowering of quality and a vicious circle was established. It was quite a mistake to be constantly attacking wages. It was the load factor that should be attacked. Fixed charges and general overhead expenses were with us all the time and the key to prosperity in manufacturing was to try to give full time employment. Rationalisation meant putting certain units into full employment and putting others entirely out of action by providing a fund to pay off the capital in those units which were closed down. This meant a temporary reduction of employment, but the subsequent employment of more people. It was better to get the operation over quickly. It was the essence of successful rationalisation to reduce costs and prices in order that demand might be increased. Demand could be increased enormously if they were able to give the man in the street an article at a price that he could afford to pay. He was the base of the pyramid. Unfortunately in this country he had not a very high purchasing power. Taxes were high and wages were low. They must first be perfectly sure that the structure to be created would tend to reduce prices. The electrical industry spent too much money on selling its products. By the time an article reached the consumer the price was so high that he jibbed at it, with the result that demand was checked. It was better to cheapen the price to the user and cheapen the cost of getting the article to the user. They wanted people inside the industry to realise that their fate was in their own hands. If the industry would pull together it had a wonderful opportunity of making something of which they could all be proud and making it possible for everybody in the industry to get a proper reward for his work.

Sir Felix Pole, replying, said that it was common sense that people in an industry should conduct their business in such a way that they could make profits. The dividend declared by the Great Western Railway on the previous day would not have been declared if there had been no rationalisation scheme applied to the railways in 1921. Unregulated competition was very expensive.

Mr. P. V. Hunter proposed the toast of "The Electrical Wholesalers' Federation," to which the president, Mr. James Wilson, responded. Mr. Wilson said that we could not say that in our marketing we were operating in the best possible manner towards strengthening the position of this country. It was within our power to get to work with the pruning knife on those deadly growths—mistrust, suspicion, price-cutting, the "brass-plate merchant," the suppliers and installers of shoddy material. We should not free ourselves from them until we adopted the greatest co-operation between manufacturers, wholesale distributors, contractors and retailers.



Some of the company at the Electrical Wholesalers' Federation dinner at the Savoy Hotel.

Co-operation in marketing on the most economical lines was essential and must engage our immediate attention. He preferred to make his appeal for the bringing into being of a policy of co-operative effort, with this end in view between all sections, rather than that this co-operative effort should ultimately be created through economic circumstances. Economic circumstances sometimes meant a position following a period of operation which had impaired efficiency, sapped vitality, brought total impoverishment to some and partial impoverishment to all. It sometimes meant the result of government blundering, or too much government interference, or the placing of too heavy burdens upon industry, or was due to not availing ourselves of the resources within our Empire, to the neglect of our manufacturers and workpeople, from pandering and pauperising, instead of leading and teaching that only from work could reward be expected. Our manufacturers must be assured of the support of the supply authorities, wholesalers, contractors and retailers; likewise must the manufacturers extend to these sections an undertaking that they would support every effort made by those sections towards economical and efficient marketing, and see that their respective fields of activity were conserved to them.

Mr. G. O. Donovan, who proposed the toast of "Our Guests," strongly urged the elimination of "brass-plate merchants." Mr. P. F. Crinks and Mr. P. Rosling responded.

The toast of "Our Chairman" was proposed by Mr. Theodore Stretton and was given with musical honours.

ROUND THE JOBS.

A Terrible Piece of Work—Responsibility of Surveyors and Architects—Consulting Engineers and Small Jobs—Wages and Their Basis—Misleading the Buyer of Fittings.

By "CONTRACTOR."

I HAVE just returned from a week-end at a friend's house where an incident occurred which is so full of morals that I cannot resist the temptation to relate it here.

Noticing the flicker of a standard lamp, I stamped on the floor, when the flicker occurred again. Now my host's house is some 350 years old and is a mass of timber. This, added to the fact that I have "bad installations" on the brain, to some extent, made me ask him if I might remove a trap in the middle of the floor. He acquiesced and I took off my coat and removed the trap. It revealed at first a mass of tightly packed cotton wool which was, in effect, nothing more or less than dampness. I removed some of this sticky white mess with my fingers and was rewarded with the sight of a jolly little arc going on at a break in some sodden cab tyre cable. The cable had been brought to the base of a moulded insulator junction box, and, at one time or other, connection had been made by means of connectors which formed part of this base. There was, however, no lid on the box and when I touched the base it broke in my fingers like a biscuit. The first thing to do, I thought, was to effect some sort of joint in the broken cables, but when I touched them they simply snapped off, rubber insulation, copper and all; for, needless to say, they were composed of only one strand of copper.

Next day I examined the remainder of the wiring and found that on the ground floor it was almost entirely laid beneath the floor boards. There were junction boxes, connections made by means of connectors and twisted joints; in some cases the twisted joints were covered with sticky tape, in others they were not. Inspection beneath the rafters, whence all the lights on the top floor were served, showed that this space under the roof was a mass of straw which had been placed there in order to protect water pipes against the effects of frost. After scrabbling and scraping a good deal I came across cab tyre cable. This was not clipped down but trailed loosely over joists with occasional connections made in a similar manner to those downstairs, except that I did not find a single junction box; the best connection of all was one in which two porcelain connectors had been used.

The individual responsible for carrying out this installation was neither a member of the National Register of Electrical Installation Contractors nor a member of the Electrical Contractors' Association. I can picture the scene six years ago or so when the installation was put in and a scornful householder—my host was not at that time the owner of the house—was telling some reputable contractor that his price was far in excess of another price which he had secured, and that it was evident that he was trying to make an exorbitant profit. So the householder went to his "lowest price." Even then the picture is not complete, for we can see the disreputable contractor putting a boy of sixteen on to the work, telling him to economise at every point he could, and, after a few days, perhaps, realising that further economies were possible by the omission of junction boxes; a little later by the omission of connectors.

When my host bought the house he took the precaution of paying a fee to a surveyor in order that this man might go down to the house and report upon its condition in every respect. My host got for his fee the assurance that the house was in every respect satisfactory, and there were no criticisms to offer. The surveyor could not possibly have tested the installation himself, but in this case he should either have included in his report some reference to his inability to comment on the state of the electric wiring or, alternatively, should have recommended my host to pay a consulting engineer to test this very important item.

Responsibility.

It is no light responsibility that these three persons—the original householder, the surveyor and the contractor who did the wiring—took upon their shoulders, for they might very easily have been responsible for the loss of a most beautiful house, and, further, for injury or death to its occupants.

The incident referred to above once again very seriously raises the question as to whether it is safe to trust an architect or a surveyor to give an adequate report upon an electrical installation. Architects and surveyors can hardly be blamed for not understanding the trade of the electrical contractor. But they can and should be blamed very much for assuming that there is no need to incorporate details of that subject in any report they may make. It is the duty of their client, in the first place, if he wishes to have a satisfactory report, to instruct a consulting engineer to examine the installation. There is a quaint idea, which is very prevalent these days, to the effect that the consulting engineer is a man who only builds power stations and designs the electrification of railways. People do not seem to think of him as a man who is also available for making just such reports as those I have mentioned.

The Wage Increases.

The new increase in the wages of electricians and assistants will come as a shock to very many people. This increase must not in any way be confused with the recent application on the part of the Electrical Trades Union for an increase to two shillings an hour. This recent advance is in accordance with the sliding scale which applies to the trade. The advance to two shillings was consistently and successfully rejected by the National Federated Electrical Association, who have reasonably held that the electrical contracting industry was not sufficiently prosperous to entertain the idea of such an increase. The electrical contracting industry is remarkably fortunate in its labour disputes committee, and one may very well accept their decisions in the matter of wages without question. Anyhow, no member of the Association can say that he was not afforded an opportunity to put forward his views. As in so many cases of this sort it is those who did not attend the meetings who are the first tocriticise.

I have always held that a really good electrician is worth far more than two shillings an hour. But—and it is a very large but—the average electrician is not worth that amount, and the majority of electricians—not to be confused with the average electrician—are not worth the wages which an assistant receives to-day. I should like to take half a dozen of the electricians whom I employ and pay them at least half-a-crown an hour. I should like to pay a very large number of the remainder about one shilling an hour. Unfortunately, the trade unions will not listen to payment by merit, therefore my good electrician continues to receive only one and tenpence three-farthings, because I have to pay his inefficient colleagues the same amount. It is argued of course that one shilling an hour would not be a living wage and that the sole aim of the trade unions is to see that all their members receive a living wage. But just see what the effect of paying a shilling an hour to the inefficient workman would be. These shilling-an-hour gentlemen would immediately resolve themselves into two classes. The first class would be those who were earning a shilling an hour because they were too lazy or, perhaps, too ignorant to qualify for a higher rate, these could very easily, and probably would, "pull up their socks," take text-books home with them at night, pay a little more attention to how the good craftsman did his work, and, in a very short space of time would be earning better pay. The second class would be those who are inherently incapable of becoming craftsmen, and these would, in a very short space of time, be weeded out of the industry to the great advantage of everyone concerned. It is an age-long problem, but one cannot help feeling sorry for my good electrician who is only earning one and tenpence three-farthings an hour and is never to be allowed to earn appreciably more.

I heard from a friend of mine the other day of an amusing incident. He was called in by a customer of his and asked to erect two fittings which had been sold to the customer over the counter by the salesman of the manufacturing company. My friend gave an estimate for the necessary wiring to two points to serve these fittings and an exasperated customer informed him that the estimate was exorbitant. When it was pointed out that it was necessary to run back for a very long distance in order to pick up the feed, the customer promptly replied that the salesman who had sold him the fittings had said that it would only be necessary to run one foot of tubing from where the fittings were to hang to an existing tube along the wall. It was then pointed out by my friend that the tube run in question was supplying high tension current to a Neon light sign!

BOOKKEEPING FOR ELECTRICAL CONTRACTORS.—IV.

Entering Up the Cash Received—Recording Discounts Allowed to Customers—Balancing the Personal Accounts.

By S. HOWARD WITHEY, F.C.I.

ALTHOUGH the contractor's cash book will be nothing more than a cash account bound in book form for the sake of convenience, the precise rulings will depend to a large extent on the particular class of business and the method which has been set up for handling and dealing with the cash. If, for example, it is the custom to keep back certain amounts of cash received from customers and debtors in order to be able to defray pressing shop or office expenses or to meet the claims of local creditors, it will usually be found necessary to use a form of cash book which has been provided by the printers with three money columns on both the debit or receipts side and the credit or payments side. In the case of the contractor who pays all cash received into the bank intact, without exception, two money columns on the payments side of the cash book will suffice.

The three money columns on the debit side should be headed " Discount," " Cash," and " Bank," respectively. Upon the receipt of cash from a customer in whose name a ledger account has been opened in the contractor's books the amount should be entered up in the middle or " cash " column, with the date and the name of the sender. This applies whether the remittance is in the form of a cheque, postal order, or notes, or actual coin, and the amount should be posted from the cash book direct to the credit side of the particular person, firm, company, or corporation, etc., giving the date and the words " By Cheque," or " By Cash." The amount recorded on the debit side of the cash book and the amount posted to the credit side of the personal account will constitute the double entry, and in order to connect the two items and to show at a glance that the two sides of the transaction have been duly recorded, the page or folio on which the customer's account appears in the sales ledger should be inserted against the cash book entry, and the cash book folio against the entry made in the ledger. Upon no consideration should a ledger folio be inserted against an item in the cash book until the amount has been posted.

Percentage Deductions

Customers who are allowed a percentage deduction from the invoiced prices in respect of payment within a stipulated or a recognised period will usually make the deduction at the time of remittance, the net amount being recorded in the " cash " column of the contractor's cash book in each instance. When the accuracy of the deduction has been verified, the amount of the discount should be entered in the " Discount " column on the debit side of the cash book, and on the same line as the item of cash to which it relates. Both the cash and the discount will have to be posted to the credit side of the customer's ledger account, either separately or as one entry reading " By Cheque and Discount " or " By Cash and Discount." At the end of each month, the total of the " Discount " column of the cash book should be transferred to the debit side of a Discounts Account kept in the impersonal ledger, this ledger entry giving the date, viz., the last day of the particular month, the words " To Sundries per Cash Book," and the cash book folio, the folio of the ledger being then inserted underneath the total to show that the amount has been properly dealt with. Rebates allowed by manufacturers and suppliers should not be treated in the books as discounts, but should be recorded in the returns and allowances book, or at the end of the contractor's purchases book.

When all cash receipts are banked, the total of the cheques, notes, coin, etc., paid in should be extended into the outer or " Bank " column on the debit side of the cash book, and some care should be exercised to ensure that each sum deposited corresponds with the total of the items entered in the " Cash " column. If any money is kept back the actual sum paid to bank will have to be recorded in the " Cash " column on the credit side, showing the date and the words " By Bank," and also in the " Bank " column on the debit side, with the same date and the words " To Cash," these two cash book entries being connected by the insertion of the word " contra," or the abbreviation " c/-," in the ledger folio column against each. The amounts entered in the " Bank " column on the receipts side should agree with those shown on the deposits side of the contractor's pass book, and it is a good plan to compare them whenever the pass book is available, and at least once every month.

We come now to the method of keeping and balancing the personal accounts of customers and debtors. These accounts should be kept in a separate ledger, and should not be merged with the accounts of creditors and trade suppliers. For the most part the amounts appearing on the debit side of any sales ledger account will represent the invoiced prices of lamps, batteries, domestic appliances, wire, cable, switchgear, and accessories, etc., supplied by the contractor from time to time or the charges made for installations and other services, as detailed in the day book, the folio of which should be shown against each item. On the credit side of the account will appear the different amounts of cash paid by the customer, and the discounts allowed by the contractor for prompt payment, both these having been posted from the cash book, also the value of any returns or allowances made by the contractor in lieu thereof, as detailed in the sales returns and allowances book, or at the end of the day book.

To guarantee that too much money is not locked up in the form of book debts, and to ensure that debtors' accounts are not being allowed to remain outstanding month after month, it is advisable to balance the sales ledger at the end of each month, and to make out a list of debtors. When balancing an account the total of the debit items should be inserted in pencil, in the first instance, directly underneath the last entry on the debit side of the ledger account, and the total of the credit items inserted underneath the last entry on the credit side. If the debit total is the higher figure, the difference will represent the sum owing to the contractor, and this amount should be entered as the last item on the credit side, with the balancing date, and the words " By Balance carried down." When this has been done, the debit and credit totals will agree with each other, and may be ruled off directly opposite each other on the same line, the balance being at once brought down on the debit side of the account as the opening entry for the next month, with the date and the words " To Balance brought down."

In the event of a customer having overpaid his or her account, the credit total will exceed the debit total, and to rule off such an account the difference would have to be inserted as the last entry on the debit side, with the date and the words " To Balance carried down," enabling the two totals to be ruled off and the balance brought down on the credit side, with the opening date and the words " By Balance brought down." Usually the abbreviations " c/d " and " b/d " are used to denote " carried down," and " brought down," respectively. When the two totals of an account exactly correspond with each other, they should be ruled off at once to show no balance outstanding.

In the next instalment of this series the method of keeping contract accounts will be indicated.

(To be continued.)

INTERNATIONAL TELEVISION INSTITUTE.

We welcome the first issue of the Bulletin de l'Institut International de Télévision (for January). The Institute was founded as the result of a conference held last August and has its headquarters at 87 ch. de Tervueren (Anderghem), Brussels. intending members should communicate with the President of the Institute at the foregoing address. The annual subscription is 10 Belgas (50 Belgian francs). The first issue of the Bulletin contains papers by M. Ch. Gheude (Quelques considérations physiques sur les éléments photosensibles) and by M. Pierre Matvieff (Étude d'un procédé de Télévision).

The Dominion Water Power and Reclamation Service of the Department of the Interior of Canada has recently issued volume 59 of the water resources papers, containing the results of investigations made by the Dominion hydrometric survey during the climatic year October 1, 1926, to September 30, 1927, in British Columbia. Copies may be obtained free from the Director of the Dominion Water Power and Reclamation Service, Ottawa.

ELECTRICITY SUPPLY IN PUBLIC BUILDINGS.

Difficulties Caused by Multiplicity of Regulations—Automatic Circuit Breakers or Fuses?—Water Heating—Danger from Earthing Wires—Insulation in Bathrooms.

A PAPER dealing with the regulations affecting the supply of electricity to large buildings, theatres, etc., was read by Mr. W. J. Jeffery, A.M.I.E.E., at a meeting of the London Local Technical Group of the Electrical Power Engineers' Association, on January 28th. Mr. J. H. C. Brooking presided.

Mr. Jeffery's principal object in reading the paper was to call attention to the difficulties encountered by supply authorities and engineers in connection with the supply of electricity to public buildings by reason of the fact that some half a dozen sets of regulations have to be complied with. The regulations governing such supplies fell into six groups :—

(1) Those of the Electricity Commissioners, under the Electric Lighting Acts.
(2) Home Office Regulations, under the Factory and Workshops Acts.
(3) Regulations of the various supply authorities, which are based primarily upon the first two groups, with the addition of special clauses dependent upon local conditions.
(4) Regulations of various licensing authorities for theatres and other places of public resort.
(5) Regulations for the electrical equipment of buildings, formerly known as the I.E.E. wiring rules.
(6) Regulations of fire insurance offices.

Generally speaking, said Mr. Jeffery, the Electricity Commissioners' regulations applied to supply undertakings, and contained few clauses relating to buildings, these clauses being framed with a view to ensuring the safety of the public. The Home Office regulations applied to factories and workshops.

Size and Cost.

Section 26A of the Commissioners' regulations provided that a suitable safety fuse or automatic circuit breaker should be inserted as closely as possible to the point of entry. In view of the size of services now frequently run in, he regarded the substitution of the circuit breaker for the fuse as a very desirable development, almost the only hindrance to which was the difference in the cost of the two pieces of apparatus. Several undertakings were adopting circuit breakers, and he asked what was the lowest limit of size adopted for this purpose. This led him to comment upon the urgent need for educating architects and property owners to the necessity for housing electrical apparatus decently.

A very frequent source of difficulty between supply authorities, contractors and owners of installations arose from the many slipshod methods of installing conduits in buildings. Sometimes such poor slip joints were used that there was no mechanical or electrical continuity in the conduit. It seemed necessary then for the authority to defend its action if it refused to connect, basing this refusal on Sub-Section 5 of Clause 27 of the Electric Lighting (Clauses) Act, 1899.

The regulations concerning installation were the logical development of the various regulations drawn up by the fire insurance companies, some of which were excellent, but could now be considered to have been superseded by the I.E.E. regulations. Speaking generally, none of the I.E.E. regulations had been more completely neglected than had Paragraph 94F, which provides that in installations where the normal working current in any circuit or circuits connected to the main distribution board exceeds 100 amps. there shall be provided, in addition to a fuse or circuit breaker with overload trip, an automatic device whereby the installation or faulty circuit, as the case may be, shall be disconnected in the event of a leakage to earth ; and that this device may be set to operate with any prescribed value of leakage current, provided that such value does not exceed 100 amps. Very few people seemed to be aware of its existence, and some had stated that it was impossible to carry it out with d.c. A few manufacturers had developed apparatus to do what was needed, but found that there was practically no demand for it. The G.P.O. engineers had put such apparatus into standard use, and deserved credit for that. Adoption of such apparatus involved the use of circuit breakers, and the only objection he could see was that of price.

Referring to Rule 126A (d), which provided that the H.P. conductors should conform in all respects to the appropriate British Standard Specification where a step-up transformer was used for raising the pressure of supply, he doubted whether this regulation was sufficient to deal with the high pressure mains involved in the supply to neon signs.

Again, although Rule 123H provided that in water heating apparatus the water should not be in direct contact with the live portion of the heating element, the development of thermal storage had introduced boilers heated by 3-phase current with pressures up to 11 000 V, and in which the heating was effected by immersing C.1 electrodes direct in the water, so that this development was directly in opposition to the rule. Various large installations had been equipped in this manner. It was likely that a carefully considered exemption clause would have to be drafted, leaving the existing rule to cover the smaller and lower pressure domestic apparatus.

Dealing with the London County Council regulations concerning electricity supply to places of public entertainment, he said they were in many respects comparable with those concerning electricity supply in mines, which were the most stringent regulations in operation. The L.C.C. regulations called for two entirely distinct systems of lighting for all parts of the buildings to which the public had access. Rule No. 80 (Section e) provided that the I.E.E. regulations should be complied with, except that only Class R (armoured cables), Class T.1 (conduits, screwed), or Class T.2 (metal conduits not screwed) should be used in the wiring systems. This debarred the use of lead-covered or C.T.S. cable unless run in conduit, and there was an apparent divergence of opinion between the authorities responsible for the two sets of regulations. In a recent letter to the Press, the Council of the I.E.E. had reaffirmed the opinion that lead-sheathed cables were both suitable and safe if installed and maintained in accordance with the I.E.E. wiring regulations.

Commenting on the L.C.C. rule that wiring must not be run in lift shafts or ventilating ducts, he said that the sooner definite and suitable conduit routes were provided in all buildings the better. Another rule was that electric radiators should be installed only in approved positions and must be provided with guards at least 6 in. from the elements. This was a direction in which most radiators might well be improved. He welcomed also the rule that gas and water pipes must be excluded from the electrical supply intake rooms, and that these chambers must be of adequate size, constructed of fire-resisting materials, and ventilated to the outer air. The L.C.C. regulations prohibited the use of twin-twisted flexcords without protection, except for pendant lights and portable table lamps, whereas the I.E.E. permitted their use for fixed wiring, fixed fittings, and so on. He had seen recently a shop window in which flex for lighting was securely fixed to the window frame with what appeared to be ordinary drawing pins inserted between the two flexes, so that there was much to be said for the L.C.C. restriction.

Discussion.

Mr. Arthur E. Drew, discussing the rule in the I.E.E. regulations concerning the provision of leakage protection on circuits exceeding 100 amps., and also the earthing of the neutral point on consumers' premises, said that experience had shown that circuit fuses were not of much use in some cases. The necessary apparatus did exist, but one could not provide leakage protection unless some part of the circuit was earthed, so that some decision must be come to with regard to earthing. The authorities in New Zealand were insisting on the protection of practically all circuits, and he believed they limited the rating of the circuit breakers to 5 amps. Circuit breakers were operating at as low a current as 5 amps. If the demand were sufficient such breakers could be supplied probably at something under £1.

Mr. A. F. Harmer emphasised the difficulty of obtaining adequate sites for transformers in buildings. One of the greatest bugbears was the curious attitude of the architects, who appeared to think that one could put a 300 kVA transformer into the space previously occupied by an ordinary five-light gas meter.

A speaker, after commenting upon the difficulty sometimes experienced in interpreting various regulations, owing to the curious wording adopted, said that he had had many interviews with L.C.C. authorities, and they had always stated

Digitized by Google

quite clearly that every job would be considered on its merits. It was well that that should be known. The Middlesex County Council regulations relating to large buildings were just about as strict as those of the L.C.C.

Another speaker said that it was extremely difficult to get the authorities to make a pronouncement on any difficult matter until the work had been done, and then often it was condemned. Insulation work which was regarded in one district as sound was considered to be unsatisfactory in another. The introduction of an earthing wire into a building was a source of danger, because such a wire was always assumed to be in order and was never inspected after it had once been fixed.

Co-ordination of Rules.

Mr. W. F. Andrews (Hon. Secretary of the Group) said he would like to know why the L.C.C. did not always stick to their own rules with regard to the provision of proper spacing between the points of entry of gas, water and electricity mains into buildings. He agreed that it would be advantageous to have only one set of regulations relating to public buildings, which would be binding on the whole industry.

The Chairman, discussing the difference between the I.E.E. and other regulations, said that the I.E.E. rules were not so severe as the others because they had regard to the pockets of the individual consumers, whereas the other regulations affected everybody else's pockets. A house-owner would not have an installation at all unless the price was reasonable, and the other regulations were more severe than those of the I.E.E. because they legislated, not for the safety of the few inhabitants of each individual house, but for the safety of people in bulk. In regard to the desire for co-ordination of the existing rules, the meeting might care to express an opinion which might be referred to some competent body for consideration.

Dr. Allan urged that one set of rules only was needed. In regard to a.c. supplies to consumers having transformers on their own premises, he understood that the consumer could elect to have earthing or not. It seemed to be entirely wrong that that should be at the discretion of the consumer. He mentioned cases in which people had been electrocuted in bathrooms, and asked whether there were regulations as to the apparatus to be used, for instance, when switches were within reach of a person in a bath, and so on. He had seen plans of an American concrete building which included the provision of ducts below the level of each floor for the purpose of carrying cable and other services.

Mr. W. F. Andrews said his supply authority had ruled that the switches, lampholders, etc., installed in bathrooms on the Council's housing schemes must be of insulated materials.

Mr. Jeffery, replying to the discussion, and referring to the point that some authorities applied their public building supply regulations only to buildings with seating accommodation for over 500 people, said that, as the result of the Paisley disaster, those authorities would probably consider very seriously whether this limitation should be withdrawn. A manufacturer had told him a few weeks ago that he had received an inquiry for the supply of the largest number of circuit breakers he had ever been asked to quote for. The inquiry was from an undertaking abroad, who wanted to buy many thousands, the majority of them for currents under 50 amps. During the last few years he had noticed that architects were beginning to appreciate the position, and in certain directions things had become more satisfactory than they were hitherto. In this connection he called attention to the clever move made by the Electric Lamp Manufacturers' Association in attaching a fully qualified architect to the staff of their lighting bureau at Savoy Hill, London. He was able to put forward in architectural circles the views of the electrical industry. The various supply undertakings might with advantage group together and employ architects in a similar manner. As to co-ordination of rules, he gathered that it was not the intention to ask for the setting up of any new body, but that the Electricity Commissioners would be asked to consider the standardisation or grouping of the various rules. The I.E.E. rules did cover fittings in bathrooms to a limited extent by providing for the earthing of exposed metal parts, and also for placing them beyond the reach of the person in the bath.

After some discussion the meeting made a recommendation to the Transmission and Distribution Committee of the London Technical Group that the existence of too many sets of regulations concerning electrical supply to public buildings led to confusion, and that the matter should be considered and, if thought fit, representations as to the desirability of co-ordination should be made to a competent authority.

ELECTRIC WELDING.

Superiority to Riveting—Large Saving in Cost—Application to Shipbuilding.

At a meeting of the Institution of Structural Engineers, at Denison House, Vauxhall Bridge Road, London, on February 13th, Major James Caldwell read a paper bearing the title of "Welding."

After describing various processes of electric welding, Major Caldwell said that tests on ship plates welded with good quality covered electrodes had shown that, compared with riveted joints, the arc welded joint was consistently superior in ultimate strength, and water and air tight up to its breaking point. Stronger steels had recently been introduced for shipbuilding, and their use reduced deadweight without sacrificing strength.

In this country welding was not permitted for boilers by the official bodies who controlled boiler construction for some purposes, nor by the boiler insurance companies. For pressure vessels used in American oil refineries arc welding had been in satisfactory use for some years. Investigation by some good authorities showed that boiler failures occurred at riveted seams, and consequently, said these authorities, some form of welding must take the place of the riveting.

Pipe lines represented a very important branch of welded construction. In the case of pipes for water supply to the East Bay Municipal District, in California, electric welding was adopted. An offer received for riveted construction was £2 270 856, and the offer accepted for electric welded construction was £1 847 399, the difference in cost being £423 457, or 18·6%. For gas supply between Lamkin and Hodge, Louisiana, 45 miles of 7 in. dia. pipe was used, with 11 000 joints. An offer for oxy-acetylene welding was received of 11s. per joint, and the accepted offer for electric arc welding was 5s. per joint. The saving in cost was 6s., the actual cost 2s. 4d., and the profit 2s. 8d. per joint.

Probably one of the most extensive fields of application for electric arc welding was in the construction of oil storage tanks, although work on these had so far been limited to bottoms and roofs.

The manufacture of machine parts out of steel plates and rolled sections united by welding, as a substitute for castings, was now a standard production in some branches of engineering. In electrical machinery the magnetic properties required in certain parts were improved by welding. The largest electrical generator yet put into service was one of 160 000 kW, in the 14th Street station of the New York Edison Co. The stator frame and casing of this machine were entirely built up of steel plates and shapes, welded by electrical methods.

It was now for structural engineers to make use of this improved tool, and, by virtue of their knowledge of the particular requirements, to modify their designs and utilise special steels in order to secure the greatest possible advantages from an extensive use of electric arc welding, which had been shown to be the most wonderful means of saving materials and labour, besides providing efficient construction, that had been perfected in the twentieth century.

Discussion.

Prof. Haigh said he had been one of the first to argue that a welded joint was decidedly better than a riveted joint. He thought the saving of material that was possible with welding would make very great changes in the immediate future.

Dr. Oscar Faber said that at present they were prevented by the London County Council from taking whatever advantage there might be in the substitution of welding for riveting.

Dr. Stradling (director of the Department of Scientific and Industrial Research) referred to the desirability of finding a method of testing welded joints in the field. Four methods had been suggested, but none of them had been used to any extent.

Sir George Thurston expressed the opinion that before many years had passed arc welding would be applied not only to the hulls of ships, but also to those portions of a vessel on which its strength depended. There was no doubt that in Germany the application of arc welding had helped the German builders to obtain results which would have been impossible with the ordinary construction.

Mr. Ewart S. Andrews said it seemed to him that welding was rather more easily applicable to reinforced concrete than to structural steel work, as far as present knowledge went.

THE BRITISH INDUSTRIES FAIR.

Some of the Domestic and Radio Exhibits at Birmingham and London Sections—Electric Water Heating well Catered for.

(*Continued from page 207.*)

MESSRS BULPITT AND SONS, LTD. (Swansea Works, Birmingham), Stand No. 20K-5. Here are to be seen examples of modern water heaters for domestic hot water supply. The type shown is the "Storage" heater calling for light loads spread over considerable periods and therefore adapted to take full advantage of any special tariffs which may apply to the scheme of charges operative in certain districts. The loading of the 10 gallon size heater is 0·75 kW, while the loading of the 15 gallon tank is 1 kW. Temperature is adjustable by the thermostat setting and can be varied between 120 deg. F. and 200 deg. F. An immersion heater of improved type is employed, working at a relatively low heat. It can be removed from its containing tube by turning a cap with a bayonet joint, which allows the porcelain former and heater to come away bodily without breaking any water joints. The thermostat is of a new type giving increased sensitivity, and operates the mercurial switch by means of a bi-metallic spiral strip. The temperature control is within two or three degrees of the figure for which the thermostat is set initially. A single coating at the base of the inner container carries the whole of the fittings, such as water inlet with a non-return valve, heater, thermostat, and porcelain terminal block. This plate is removable and allows access to the inside of the container for the purpose of cleaning out or scaling when necessary. When set up a covering cap encloses all the controls and preserves a clean outline to the tank with no pockets to trap the dust. In one type of tank adapted for pressure service the cold water feed is from the usual ball cistern at the top of the building, or from the mains, the hot water being led off from either top or bottom of the heater to the required site and controlled by stop cocks on the outlets.

BRITISH INDUSTRIES FAIR.
Feb. 17—Feb. 28.

Readers are cordially invited to visit the stands of THE ELECTRICIAN and allied publications at Castle Bromwich and Olympia, London, and to make full use of our Service.

CASTLE BROMWICH
Block 8G, Stand 1.

OLYMPIA
Stand D170.

THE EVER READY CO. (GREAT BRITAIN), LTD. (Hercules Place, Holloway, London, N.7), Stand No. 7G-3. A full range of electric lamps, batteries and accumulators is on view. The firm is also exhibiting in London, where their stand is in the wireless section, Nos. D22 and 32.

RANSOMES, SIMS AND JEFFERIES, LTD. (Orwell Works, Ipswich), Stand No. 9K-2. Electric lawn mowers of various types and sizes are being shown on this stand.

RESTLIGHT, LTD. (Aldwych House, Aldwych, London, W.C.2), Stand No. 21N-1. This company is displaying for the first time the improved "Restlight" filter screen. A new pattern glass is being used, giving much greater diffusion, and this, combined with an improved composition, results in a filter claimed to be far ahead of any other "artificial daylight" screen on the market for general illumination. As usual, all types of lighting fittings are being shown embodying Restlight glass, including the new P.R. model. This is a highly decorative model for bedside use, roll top desks, bureaux, piano tops, etc. The "Lamplough Daylamp," is also demonstrated.

The EDISON SWAN ELECTRIC CO., LTD. (123-5, Queen Victoria Street, London, E.C.4), Stand No. 19J-1. Ironclad switches and fuses and standard lighting accessories. In addition the new range of Ediswan "Fabrolite" house wiring accessories. Tungar rectifiers and chargers. Samples of all types of cable manufactured by Edison Swan Cables, Ltd., from the smaller flexibles to the heavy bitumen insulated cables for collieries, and paper insulated cables. Various examples of Ediswan stationary-type battery work, together with the many smaller types of accumulators and dry cells, including those used for radio purposes. Sangamo-Ediswan meters of various types and the Ediswan range of domestic, heating and cooking appliances. Ediswan radio products, including transmitting valves, the Mazda valve series, Ediswan all-electric receivers and the B.T.H. R.K. reproducers and loud speaker equipment. Royal Ediswan lamps of representative types including the "Pointolite" lamps. The Thor Juvenator—a type of health motor is also shown.

REVO ELECTRIC CO., LTD. (Britannia Works, Tividale, Tipton, Staffs), Stand No. 19H-4. The most interesting exhibit on this stand is the sample electric cooker in which all elements, boiling plates, grill and ovens are of the plug-in pattern. The makers believe that this is the first time an electric cooker has been so constructed. This has been made possible by the evolution of a suitable plug and socket which is not affected by local heat and therefore retains its resilience over an indefinitely long time. A smooth action is claimed and a maximum area of contact prevents arcing and resultant corrosion. This contact is obtained by the utilisation of a steel ring which encircles the brass socket. The socket is split into four segments, whilst the male portion is solid. This system is patented; it is also applied to the connecters of all Revo irons and kettles. Cookers are also exhibited in which top and bottom plug-in elements are employed and alternatively side and bottom. The cookers are finished in a special mottled vitreous enamel; and the firm's established policy of applying vitreous enamel to both sides of all sheet metal portions is followed. Deterioration due to rusting and corrosion is thereby avoided. Another cooker exhibited is completely enamelled in the new rainbow vitreous enamel finish. In connection with the cookers, a feature of interest is the adoption of a new switch. These switches are dustproof and situated behind the vitreous enamelled switch indication plate, the terminals being easily accessible for wiring and inspection. The well-known Revo superspeed boiling plate is also demonstrated. A range of irons is shown in chromium plated finish. There is also shown a new fire, which is elegant in design, and contains an efficient fire bar. This, whilst it follows the principle of the emitter bar, wherein the element is laid in parabolical troughs, takes a form more suited to the particular application required in the "Matchless" fire. The element, which is split into three sections, is so arranged that an even distribution is obtained over the reflector whichever portion of the element is in operation. Other devices of interest in the domestic field include a water heater, wash boilers, kettles (plain and automatic) and hot plates. An attractive display of street lighting fittings is exhibited. The refractor band is shown in several new fittings and a fitting of particular interest is the "Nigerian." This is made entirely of cast iron with an interesting "mirror finish" which is produced by a special vitreous enamel. Switches, fuses and ship fittings—from engine room pendants to cargo clusters—are also to be seen on the stand.

BERKELEY AND YOUNG, LTD. (Hay Mills, Birmingham), Stand No. 20K-4. The manufacturers of "Bandy" fans are showing a comprehensive range of exhaust and ventilating fans, in which they have been specialising for some twenty years. Included are marine (cabin and saloon) fans; slow speed ceiling fans for theatres and restaurants; boxblade exhaust fans for picture houses, workshops and laundries; oscillating and desk and wall fans for domestic and commercial use; and railway carriage fans and fans for refrigerator work, either direct or alternating current. Ceiling fans are fitted with various types of blades and supplied from 9 in. to 48 in. diameter; the whole is entirely of British material and made throughout at their works in Birmingham. Amongst the more recent productions exhibited is the "Ellipso" oscillating fan, which the makers claim to have the simplest control movement

(*Continued on page 232*).

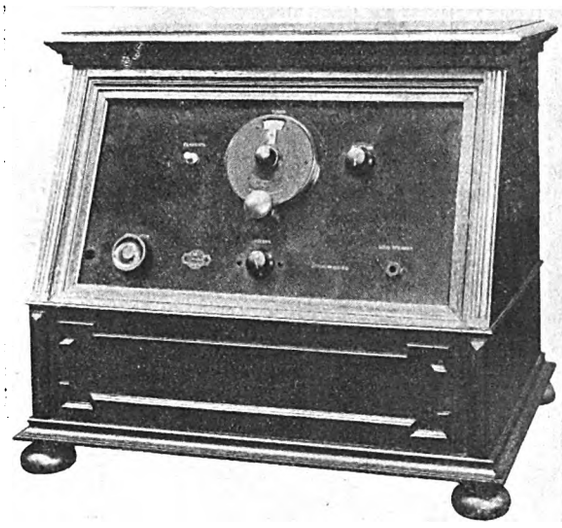
yet evolved. The elliptical traversing action of this fan is obtained by means of a single link which is connected to and rotates with a slow motion shaft. The link is anchored by a universal ball joint to a fulcrum fixed to the base. The reducing gear of 144 to 1 is contained in a simple gear box integral with the motor end cover and fitted with a friction clutch eliminating chance of damage by anything fouling the



The "Igranic Neutrosonic" short-wave receiver.

guard. The reducing gears are of hardened steel, worm wheels, having straight cut teeth, reduce friction to a minimum. Amongst the several models exhibited of slow speed ceiling fans, one of particular note is the model known as the "08," for direct current; it has been specially produced to comply with the exacting conditions of tropical service and Government requirements. The fan is automatically lubricated. Another interesting exhibit is the "Ace" a.c. ceiling fan; the motor in this case is of the enclosed induction type, fitted with ball bearings and so constructed as to be absolutely grease-tight; the watt consumption is 110, at 210 r.p.m. The air displacement is over 10 000 cubic feet. Speed regulators for use with the "Bandy" ceiling and exhaust fans, both d.c. and a.c., are also exhibited. These are fitted with five to seven speeds and are supplied with or without fans. Messrs. Berkeley and Young have for the past 25 years been manufacturing repulsion induction motors. They have recently perfected a new range of R.I. motors from $\frac{1}{6}$ up to 1 H.P. Samples of these motors are on their stand. They also manufacture the "Bandy" S.P.A.C. lift and crane motors, a model of which is displayed. Another exhibit shows two models of the "Giljay" battery charger.

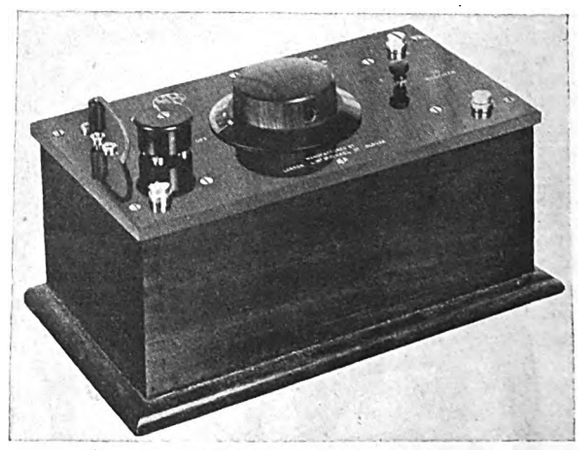
GEO. BRAY AND CO., LTD. (Leeds), Stand No. 21J-1. This firm show samples of the different articles they manufacture for the electrical trade. The "Chromalox" heating units are to be seen, both in the form of separate strips and rings and as the heating element in boiling plates, immersion heaters, radiators, car heaters, etc. Messrs. Bray include in their display several appliances, such as hot water boilers, radiators, fish frying ranges, etc., manufactured by firms fitting "Chromalox" units as the heating elements. The Bray electric lampholder is shown in a range of patterns and finishes. A comprehensive display of electrical porcelains and steatite insulators show the many forms in which the firm makes these insulators. The stand is decorated in the "Chromalox" catalogue colours—orange and black.

BELLING AND CO. (Bridge Works, Enfield, Middlesex), Stand No. 20K-3 and 4. This stand features a wide range of "Belling" electric heaters. Many different types of fires are displayed, both for domestic and industrial purposes. Amongst the domestic range are some portable designs in several finishes. Special attention is drawn to the "Empire" fire which is a new series introduced this season. Other models new this season are on view and there is also a range of imitation coal fires fitted with a realistic flickering flame effect. For industrial purposes, there are totally enclosed and fireproof air warmers, pipe heaters and electric hot water radiators. A series of electric cookers is also on show, ranging from the well-known "Baby Belling" cooker—suitable for small families—up to full size models. Included also are electric water heaters, suitable for fixing into any existing tanks or cylinders and for use in conjunction with the ordinary domestic hot water system. A new series of enclosed type boiling rings, makes another interesting exhibit. Practical demonstrations are given of the "Parmotor" relay. This is a new device for automatically controlling electrical circuits and is claimed to be more reliable, more flexible and cheaper than a time switch.

CREDENDA CONDUITS CO., LTD. (Oldbury, Birmingham), Stand No. 21L. This striking stand is built to simulate a large stone temple of modernist design. It displays a wide range of Creda electric cookers of latest type. These are shown in the two finishes which have been standardised, "Standard" and "De Luxe." An additional model is shown in the new Creda Cub, which has been designed to meet the need for a high-class and well finished cooker at a low price. This cooker has an oven with internal dimensions, 12 in. by 12 in. by 12 in., and the hob (which, like the oven, is finished in vitreous enamel) has an enclosed grill-boiling plate 8 in. by 6 in. (1 500 W.), and a Sadia boiling plate 8 in. by 6 in. (1 600 W). Some examples of the hotel and restaurant types of cooking apparatus now made by Credenda Conduits Co., Ltd., are also shown. These include a double compartment grill on a stand, a hot cupboard, double oven range, etc. Other exhibits include Creda electric fires, the Creda tubular heating system, various domestic appliances, "Credalux" industrial lighting reflectors and a range of street lighting fittings.

YOUNG, OSMOND AND YOUNG, LTD. (47, Victoria Street, London, S.W.1), Stand No. 18H-8. "Unity" tubular electric heaters for economical heating of schools, offices, factories, hospitals, private houses, etc. "Unity" electric towel airers for floor or wall mounting available in chromium or nickel plated finish. "Unity" tubular electric heaters for heating of tar, crude oil, etc. "Unity" tubular electric heater with gas-tight fittings as used in cellulose paint shops, powder factories, etc., and tubular electric heaters for traction work, available in two patterns—up to 600 V and up to 1 500 V. Tubular 4-bar radiators for use where wall space is limited, available with or without 3 heat control. Thermostats for use in conjunction with "Unity" tubular heaters to eliminate waste and to maintain a constant temperature. Tubular heaters bent for use in bow windows, curved rows of theatre seats, etc., and a tubular linen cupboard heater. "Unity" anti-condensation device for prevention of condensation on show windows, and a car bonnet heater for complete protection from frost are among the items shown.

BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION, INC. (15, Savoy Street, London, W.C.2). Stand No. 20H-1. The E.D.A. has erected a handsome octagonal kiosk in the centre of the electrical section. Visitors are able to obtain full up-to-date information concerning the electrical facilities



The filter shown by L. McMichael, Ltd.

available in any part of the Kingdom. In co-operation with the Electrical Section Advisory Committee and the Fair management, the Association has introduced a uniform colour scheme which has been adopted by practically all the firms exhibiting in the Electrical Section.

The BRITISH HANOVIA QUARTZ LAMP CO., LTD. (Slough), Stand No. 20E-2. "Artificial sunlight," now so familiar, was little known when introduced by the first Hanovia quartz lamp 24 years ago. Since then the treatment has won world-wide recognition. In addition to sunlight lamps for medical use, the company have now smaller models for health sunbaths,

Digitized by Google

and special lamps for industrial use. Of a large range of models, one of each class is to be seen on their exhibit. The "Alpine Sun" lamp is known throughout the world and is used by physicians for the treatment of disease. The "Homesun" is for home use. In appearance it is not unlike a neat reading lamp, is easily portable, and is made for any standard electric supply. The "analytic lamp" is for industrial use. Quartz lamps have many uses in industry, from manufacturing leather to testing sugar. One of the most interesting applications is for fluorescence tests, which give an immediate indication of the chemical composition and grade of test substances. The lamp has found extensive use in banks and government departments for the detection of forgeries. The analytic quartz lamp facilitates these tests by its powerful output of invisible ultra-violet rays, passed through a special dark filter. It can also be used for the unfiltered radiation used in rapid durability tests of varnishes, fabrics and materials.

BERRY'S ELECTRIC (1928), LTD. (85–86, Newman Street, London, W.1). Stand No. 19K-1. Magicoal fires form the main exhibit; in addition, however, this year the firm is showing for the first time their electric water heaters of the storage type. In these heaters high thermal efficiency is obtained by means of a special construction, enabling the inner container (made of heavy gauge tinned copper) to be completely suspended within a liberal thickness of insulating material.

A. P. LUNDBERG AND SONS, LTD. (477–489, Liverpool Road, Holloway). Stand No. 20E-6. Visitors to this stand will see a good range of quick make-and-break and special tumbler switches for lighting and small a.c. and d.c. motor control, also up-to-date types of switch plugs. The firm's "Edgewise" type of flush tumbler switch for narrow situations is being developed in most types, among those shown being single-way, two-way, double-pole, intermediate, "Twinob," two-way with "off," and also combined with two-pin plugs (ordinary and automatic). There are also up-to-date patterns of improved two, three and four-pin plugs and sockets, fitted with the "Minimax" type of plug, which is adjustable for gripping all diameters of flexible wires. Other types of switches comprise the triple-pole tumbler, also offered with interlocked three-pin earth plug; two-way, double-pole and change over switches for radio work; special radio plug connectors; magneto control switches for aeroplanes and numerous types of special adapters.

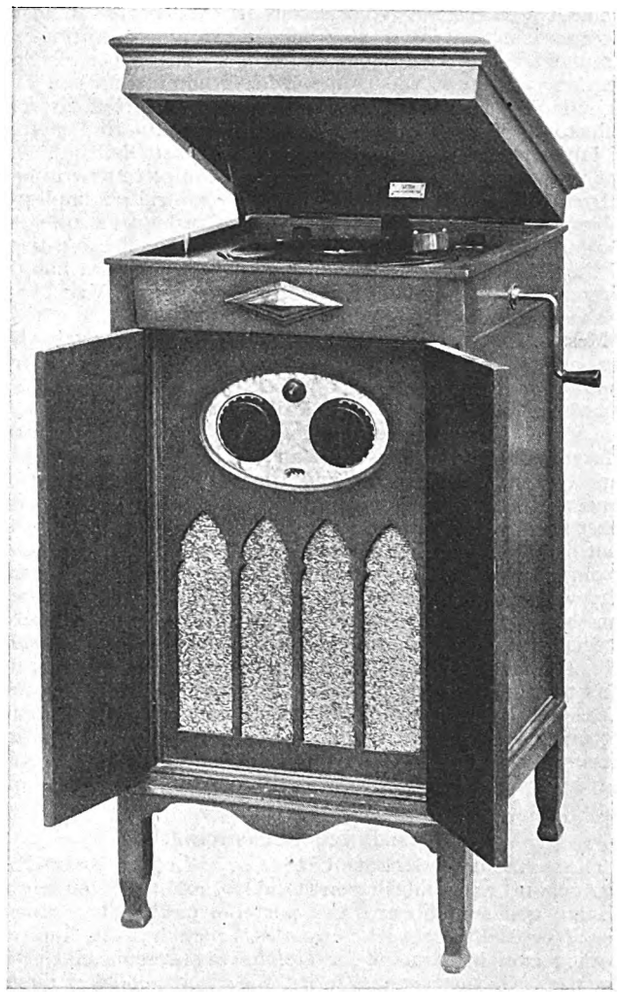
BRITISH BRASS FITTINGS, LTD. (100, Moorsom Street, Birmingham) Stand No. 21K-1. This firm is showing "Angelus" electric fires, and a large selection of electric cookers, which we understand have been considerably improved since last year. There are also electric water heaters of various types, from the "Instanter" geyser to the "Dual" water heater for use in connection with the normal household supply.

HAILWOOD AND ACKROYD, LTD. (Morley, near Leeds), Stand No. 3D-2. Lighting fittings in a variety of shapes, sizes, and designs are the chief thing to catch the eye here, though Messrs. Hailwood and Ackroyd—who are also exhibiting in London—have in addition put on view a selection of their ceiling plates, ring fittings, galleries, "Hailglass" globes for signs and advertising and "Hailware" wrought iron stands.

STURGE AND BAKER, LTD. (Premier Works, Sheepcote Street, Birmingham), Stand No. 21F-1. An interesting exhibit is the "garage winder," which is sold in various forms. Its function is to enable the driver to "help himself" to air for his tyres or water for his radiator while the car is taking in petrol. The "winder" consists of a rubber tube, which can be drawn out to the car, and through which the requisite supply can be obtained. The metal base—through the centre of which the tube passes—is marked "Air Service" or "Water Service" as the case may be. Another form of the same device is the "flex winder," which enables the motorist to draw out a hand lamp for inspection purposes. The firm also displays the "Red Rose" fire, an interesting type of electric heater with a very low current consumption. Other exhibits are the "Travellers Joy" portable heater, an electric bed warmer, and the "Stay-put cord absorber," which will support a shade up to 2 lb. in weight at any height desired.

The JACKSON ELECTRIC STOVE CO., LTD. (143, Sloane Street, London, S.W.1), Stand No. 20L-3. Electric cookers, including the No. 61 breakfast cooker, the No. 48 table cooking cabinet, the Overseas model, the Jackson Junior and others which have previously been described in THE ELECTRICIAN. The No. 48 cooking cabinet is capable of dealing with 14-18 persons, and is constructed on similar lines to the No. 46 cooking cabinet, except that the oven has a cooking space 19 in. high by 15 in. wide by 17 in. deep, the oven being loaded to 2·75 kW, and arranged for three-heat regulation.

CARRON COMPANY (Carron, Falkirk), on Stand No. 21M, at Birmingham, show a varied selection of cooking and heating appliances. The display includes the company's newest cookers representing two types. In the "M" series many unique features are incorporated in the design, the chief



One of the attractive radio equipments shown by Lissen, Ltd., at Olympia.

essentials being—all-vitreous enamel finish, inside and out, all interior fittings and parts also enamelled by this process. Side and bottom heated detachable oven interior, extra large warming chamber, bus bar wiring, cast-iron fuse box, cam lever door handle, carefully bedded and fitted joint between oven door and body, "Sadia" fast boiling plates fitted as standard. Fuses of the "Triumph" type are housed under enamelled plate, and side-hinged hob, allowing access to all connections even when cooker is situated in a confined space. The P.2 cooker on view in many ways resembles the No. 310 "Carron" cooker, but, while retaining certain important characteristics, the entire cooker has been re-designed and brought into line with modern standards and requirements. Top and bottom elements are used for oven heating, and a fixed interior is standardised. Special attention has been paid to the wiring assembly and general accessibility, but the outstanding feature is the relatively large sized oven in proportion to overall dimensions. A wide range of fires is displayed and is representative of the company's four popular series—"Carreflex," "Cathedral," "Stella," and "Carcole." An automatic kettle is shown for the first time.

CHESTERTON, JONES AND CO., LTD. (David Works, Tyseley), on Stand No. 21J-2, Birmingham Section, exhibit a range of electric cookers possessing many novel improvements, including a Davidson Junior model suitable for small families. In Davidson electric fires the display is extensive, ranging from designs in keeping with the most artistic and refined furnishings and surroundings, to models suited for use in less ambitious dwellings, also for office and industrial uses. The David electric iron is finished in shades of vitreous enamels and in nickel plate. Displayed also is a 1 lb. iron for gift purposes and for travelling. Another novel appliance is a combined lighting and heating fitting designed to give safe electrical heat in the bathroom.

Digitized by Google

C. H. PARSONS, LTD. (Britannia Works, Wharfdale Road, Tyseley, Birmingham), Stand No. 21H-4. The firm's usual range of switchplugs, switches and lampholders, also their recently introduced range of Q.M. and B. in all types.

The exhibit of the WARDLE ENGINEERING CO., LTD., (Elsinore Road, Old Trafford, Manchester), Stand 20G-3, includes a representative selection of "Workslite" reflectors, incorporating patented easy wiring cap and vibration-proof lampholders. The designs conform to the B.E.S.A. Specification, and meet the Home Office recommendation. Gas-tight lanterns with cast iron reflectors and skirted dispersive reflectors are also displayed, together with a varied selection of lanterns and fittings for works and yard lighting. It is not possible to exhibit the company's complete new range of "Avenue" street lighting units, but several examples are shown, and the Wardle Street-lighting Catalogue, L.19, will be available for all interested in the subject. An effective display of the "Maxheat" tubular electric heating system has been arranged, and "Maxheat" radiators rated at 500 V and 750 W are available for inspection.

Messrs. HOLDEN AND HUNT (Old Hill, Staffs) are again showing on Stand No. 14L-1 a range of low voltage spot and butt-welding machines. Many of these are being run on light repetition work by the practically unskilled labour of boys and girls. Actual meter readings taken by the makers over a large number of welds, on clean iron and steel articles, show that current consumption and time are extremely low. In general, it is claimed that nearly all articles built up from sheet steel or iron, which would ordinarily be riveted, can be spot or butt welded at a lower cost, resulting in a neater and stronger product. Seven machines are shown, and visitors may weld for themselves articles provided—or, if they prefer, can bring their own articles and weld them themselves. Special attention should be paid to the high speed butt welder (No. 4), in which many unique improvements are incorporated. This machine is semi-automatic and pedal operated, and is capable of welding steels up to $\frac{1}{2}$ in. diameter. Besides manufacturing low voltage welders for the installation of plants, Messrs. Holden and Hunt have a large and up-to-date welding battery where they undertake the welding of articles on a repetition basis.

Resistance Measuring.

The RECORD ELECTRICAL CO., LTD. (Broadheath, Altrincham), are exhibiting on Stand No. 20K-6 moving iron and moving coil switchboard and portable pattern instruments, also a typical range of "Cirscales," including an improved moving iron instrument for a.c. having a reduced coil impedence. Of the portable series, the change coil test sets are worthy of note, particularly by those who require a compact set for use on a large variety of circuits. For those wishing to obtain current and voltage measurements in a.c. and d.c. circuits, is recommended the change coil combined double movement ammeter and voltmeter having six current ranges from 1 to 600 A and five voltage ranges from 1 to 750 V. For those wishing to obtain only current measurements there is exhibited a change coil multi-range ammeter having six current ranges only from 1 to 600 A, also useful for a.c. or d.c. As pioneers of the light weight model combined "Record" ohmmeter and generator, this company is showing a few of the standard models having 500 V generators and scale up to 100 MΩ. To meet the increasing demand for resistance measurement equipment, Mr. J. W. Record has patented a light-weight bridge ohmmeter which is particularly interesting for its compactness, wide range and speed of operation. The set comprises an ohmmeter and a Wheatstone bridge with a testing range on the ohmmeter from 10 000 Ω to .100 MΩ and on the bridge from 0·01 Ω to 999·900 Ω. Tests can be made consecutively by the ohmmeter and bridge method by moving one switch, while the resistance under test remains connected to the same pair of terminals. There has lately been an increasing demand for electrical tachometers because they have the advantage of being adaptable for use at any distance away from the actual machine or shaft, the speed of which is required to be measured. The Record Company is, therefore, manufacturing Cirscale r.p.m. indicators complete with the necessary generators. Two models are shown, a $2\frac{3}{4}$ in. dial with a light-weight generator for air ships, and a 16 in. dial and more rubust generator for engine rooms, etc.

RICHARD JOHNSON AND NEPHEW, LTD. (Bradford Iron Works, Manchester). The exhibit on Stand No. 17F-3 consists of products in the form of bars, strips, wire, in copper, bronze, cadmium copper, aluminium and iron and steel. The bars and strips are in the sizes and dimensions usually taken by manufacturers of electrical products and machinery, and amongst non-ferrous exhibits are "Caduro" cadmium copper. It is claimed that tramway engineers who were faced with excessive wear on their copper lines have made considerable economies by the use of "Caduro" cadmium copper trolley wire. "Caduro" cadmium copper has also been found of great value in power work in long spans and pole economy. The Fair provides an opportunity to introduce something new in coated wires. Samples will be found on the stand of Johnson's "Crapo" patent galvanised wire, which may be described as an improved coated wire, as the zinc coating is perfectly adhesive under all stresses or mechanical blows. It will, the makers state, wrap on itself without flaking or peeling, which, we understand, is not always the case with wires heavily galvanised to the standard specifications.

London Section.

L. MCMICHAEL, LTD. (265, Strand, London, W.C.2). The new problems introduced by the institution of the regional transmitters at Brookmans Park have led to numerous "wave traps" and selectivity devices being placed on the market with the avowed object of separating the twin transmissions from each other and permitting more distant stations to be received. The problem has been approached successfully by the "MH" radio filter, in which there is, in a sense, no attempt to eliminate "unwanted" stations, since the wanted station is given an easy but very narrow path into which any other station can only enter with the greatest difficulty, if at all. It is claimed that it will (1) on the most elementary set give independent reception of the twin wave transmissions and 5GB; (2) on more elaborate sets it will enable distant stations to be obtained in addition to eliminating the interference of one programme of Brookmans Park with the other; (3) on all but expensive and most up-to-date receivers it will improve the selectivity and widen the useful range obtainable.

THE M-L MAGNETO SYNDICATE., LTD. (Victoria Works, Coventry), Stand No. D7. Among anode converters, rotary transformers, and motor generator sets for supplying power for the operation of radio receiving and transmitting sets, there is being shown for the first time a new d.c. to a.c. rotary transformer, which has been specially designed for supplying current for an a.c. all-electric receiver, where d.c. mains are available. Such machines are stated to be especially suitable for use with receivers such as the Philips three and four-valve models, Marconiphone model No. 47, the Burndept seven-valve screen, and also for a number of the larger radio gramophones on the market.

LUMOS AND CO. (St. John's Works, Bookham Street, London, N.1.), Stand No. F52. Some interesting electrical novelties are on view at this exhibit. There are switch plates, produced in many different colours, and table lamps in "Galatix," which material is also utilised for door knobs.

Radio-Gramophones.

EDISON BELL, LTD. (Glengall Road, London, S.E.15), Stand No. D59. The whole range of this firm's products is displayed. Radio-gramophones (battery and all-mains models), the "Picnic" five-valve portable, the Regent and Console "Fours" and various three and two-valve sets form the chief exhibits. Speakers and numerous accessories are also present

WHITTINGHAM, SMITH AND CO. (Portadyne Works, Chase Estate, Park Royal, London, N.W.10), Stand No. D30. "Portadyne" portable radio receivers—the screened grid four, the table grand and the super five are the chief items shown.

I. CALVETE, LTD. (11, Little St. Andrew Street, London, W.C.2), Stand No. A236. This stand features "Solart" sun ray lamps, "Icalite" radiant heat lamps, "Everray" violet ray apparatus and various appliances. Included among the latter are hair-dryers of every description, hand-drying apparatus, health motors for stimulating and reducing, vibro-massage apparatus, diathermy apparatus, and permanent hair-waving machines.

READ RADIO, LTD. (32, Newman Street, Oxford Street, London, W.1), Stand No. D5. This firm is showing the revised model "Popular" portable, also three and four-valve screened grid models, and a three-valve all-mains screened grid receiver. The company is now designing and manufacturing special receivers for the trade and welcomes inquiries about this class of work.

Digitized by Google

The DOWSING RADIANT HEAT CO., LTD. (Bollo Lane, Acton, London, W.3), is showing a representative display of special electrically heated appliances on Stand No. A227. Amongst the items exhibited are samples of many types of special electric irons, for all kinds of trades, including the cordless electric ironing system, and samples of special appliances, such as laundry rollers with electric heating elements applied to them. There are also milliners' hat steamers, sealing wax heaters, and the latest types of "Solarium" sun baths for home and institution use.

The ORMOND ENGINEERING CO., LTD. (Ormond House, Rosebery Avenue, London, E.C.1), Stand No. D42. The exhibit of the Ormond Engineering Co. includes a range of receiving sets and loud-speakers, in addition to a display of components. The receivers are the Ormond five-valve portables, five-valve leather portables, and four-valve screened grid portables. The Ormond four-pole adjustable loud speaker unit, cabinet loud speakers and a plaque loud-speaker are also shown. Ormond variable condensers include the logarithmic, straight line frequency, straight line wavelength and low-loss types, with and without friction control. Other exhibits comprise the following:—Slow-motion dual indicator dials, both large and small models, and the Ormond friction control dial, with ratio 55 to 1. Ormond 3 in. and 4 in. combined bakelite knobs and dials. L.F. transformers, and l.f. chokes, rheostats and potentiometers, radio frequency chokes, air-dielectric fixed condensers and moulded fixed condensers. Midget and neutralising condensers. Crystal detectors, resistance-capacity coupling units, fixed resistors, h.t. and grid bias batteries, push-pull switches and turntables are also exhibited in variety.

LISSEN, LTD. (Worple Road, Isleworth, Middlesex), Stand Nos. D41 and 46. Radio gramophones in pedestal or console models in walnut, oak or mahogany, comprised of three or four valve circuits, with frame or outside aerial, driven from a.c. or d.c. mains or batteries. Gramophones: a complete range of portable and console instruments, incorporating the Lissenola horn. Receivers: five-valve portable sets and two-valve transportable receivers operated from batteries or a.c. mains. A screened grid three home constructor's set operated from batteries or a.c. or d.c. mains. Loud speakers: units of all types. Horn and cone speakers at various prices. The new Lissen four-pole balance armature unit now obtainable mounted in a walnut bow-fronted cabinet. Batteries and accumulators: the usual Lissen range. Valves: two-V screened grid and pentode valves have been added recently. Eliminators: a.c. and d.c., also a rectifier to be used in conjunction with a d.c. eliminator for operation on a.c. mains. Components of all kinds for home assembly are also shown.

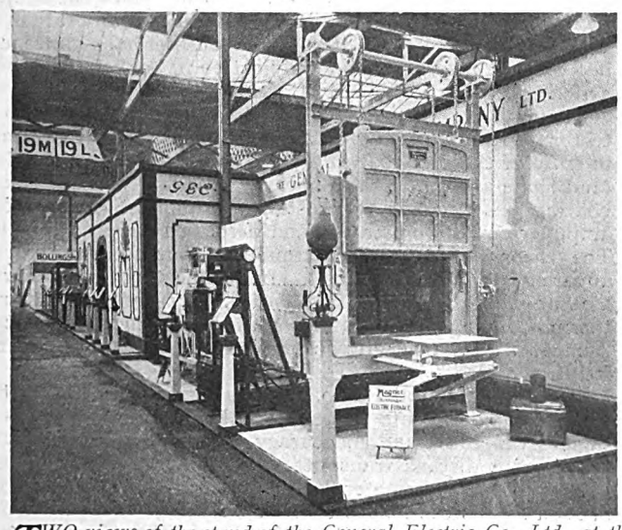
IGRANIC ELECTRIC CO., LTD. (149, Queen Victoria Street, London, E.C.4), Stand No. D26. Many newly developed radio components, as well as complete receiving sets for both broadcast and short-wave reception and radio-gramophones may be seen on this stand. The Igranic seven-valve Neutrosonic receiver, de luxe model, is shown in a neat mahogany cabinet. A set which will appeal to the short-wave enthusias is the Neutrosonic six-valve short-wave receiver, in teak table cabinet. The design of this set is based on the supersonic-heterodyne principle. Complicated tuning arrangements are avoided and only three controls are fitted on the panel. The advantages of the receiver are summarised as follows:—Good signal strength, high sensitivity, simplicity of operation and absence of undesirable noises. It is claimed to be possible to obtain world-wide reception at loud-speaker strength, on wave-bands from 12½ metres to 70 metres. Among the mains-operated receivers is the "A.C. 3" receiver. This set is fitted with a new type of self-contained frame aerial. The supply unit delivers the h.t. and l.t. current without requiring voltage adjustments. A loud-speaker is built into the cabinet. A switch is provided to change over from radio to gramophone reproduction, bringing into operation the "Phonovox" electrical pick-up. Another mains receiver is the A.C.3 table model. A dual range aerial coil is included for use in conjunction with an outside aerial. The latest mains receiver shown, however, is the A.C.2. It is designed as a "local" station set. The receiver embodies a mains unit, which is suitable for working off a.c. mains only. One knob tuning dial is provided. The apparatus is enclosed in a table cabinet, supplied in oak or mahogany. Among gramophone reproducers, the Igranicophone G.2 equipment is of interest. The equipment consists of a double gramophone turn-table, fitted with "Phonovox" pick-ups and Igranic "Phonomotors." A separate amplifier and power unit to work in conjunction with the double turn-table equipment is another of the attractive equipments exhibited.

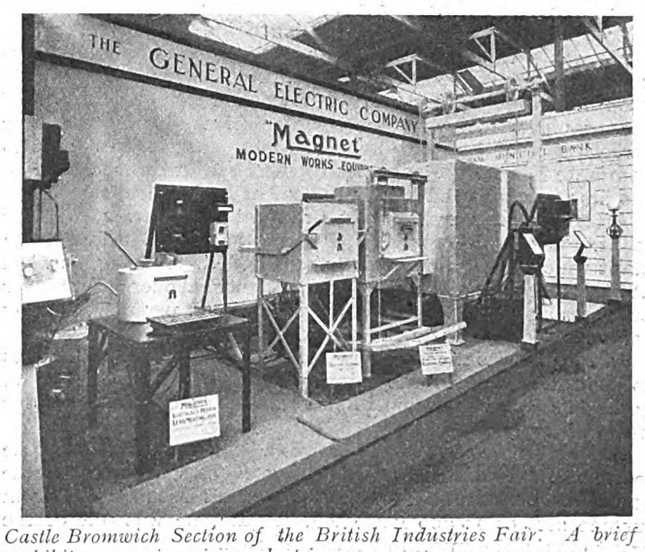
The NEOPHONE ENGINEERING CO. (8, Garrick Street, London, W.C.2), Stand No. D60. This company has put on the market a seamless vulcanite cone-diaphragm. It is made in three sizes—8 in., 10 in., and 12 in.—and can be obtained separately or mounted in a solid turned wood frame with a felt lining. The frame is attached to a baffle board of convenient size, and to the board are attached brackets, a strong aluminium brace being fixed to the turned frame for the purpose of mounting the unit.

J. J. EASTWICK AND SONS (Eelex House, 118, Bunhill Row, London, E.C.1), Stand No. D9. Here are being shown the "Eelex" standardised system of plugs and sockets, treble-duty terminals, safety switches, etc.

E. K. COLE, LTD. ("Ekco" Works, London Road, Leigh-on-Sea), Stand No. D28. A complete range of the firm's products is on show. H.T. units for both d.c. and a.c. mains with outputs ranging from 10-06 m/a., and all-power units, which enable users to obtain h.t., l.t. and grid bias from the mains without any alteration to their existing receivers or valves are also included. The "Ekco-Lectric" receiver is one that does not entail the use of batteries or any outside units. By plugging the adaptor into an electric lamp socket it is ready to switch on when desired.

(To be continued.)





TWO views of the stand of the General Electric Co., Ltd., at the Castle Bromwich Section of the British Industries Fair. A brief description of the stand, together with illustrations of some of the exhibits, were given in our last issue.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Meter Rents.

[To the Editor.]

Sir,—I am pleased to be able to inform you that the following revisions to our charges come into force as from the quarter beginning April 1st (next financial year, so far as collection):

Meter rent of 2s. 6d. per quarter abolished, no minimum charge to be substituted.

Alternative two-part tariff offered, fixed charge based on £13 per kW of adequate lighting plus running charge of 1½d. per unit (rental valuation system not possible here).

With reference to your Current Topic in your issue of January 24th *re* meter rents, my experience since coming here from Glasgow is that the meter rent causes more bad feeling towards the undertaking than our high flat rates of 10d. and 3d. Therefore even small undertakings should get rid of these pin pricks as soon as possible.—I am, etc.,

Edwin T. Pound,
Burgh Electrical Engineer,
North Berwick.

North Berwick,
February 4th.

The Late Mr. Sydney Baynes.

[To the Editor.]

Sir,—By the death of Sydney Baynes, for many years chief engineer of the Metropolitan Borough of St. Pancras, we lose another of the pioneer founders of the electrical industry.

When I began Crompton's electrical business, in 1878, my first assistant was Mr. A. P. Lundberg, and, on his advice, I took on as a boy assistant Sydney Baynes. Baynes, whose father owned a dairy in the Moscow Road, Bayswater, had watched us installing arc lamps for advertising purposes at Whiteley's, in Westbourne Grove, and had asked me whether I could take him on at my works.

From the very first he showed exceptional keenness in our new undertaking, which, during the first two or three years, was mainly in the lighting up of railway goods yards and similar open spaces by arc lamps; Baynes, although then a mere boy, was put in charge of the plant when first installed, and he had in most cases to teach the workmen the use of their plant.

After the Royal Agricultural Show, at Kilburn, where portable plant worked by Baynes attracted much attention, he was sent out by us in charge of portable plant and had many interesting experiences. In all parts of the kingdom, notably when the contracting firm of Easton Gibb and Co. were carrying out the works of the Barden reservoir for the Bradford waterworks, he showed such aptitude in using and placing our arc lamps so as to carry on work at night to the best advantage, that I was able to recommend him to take charge of similar plant at the Forth Bridge works.

He was actually in charge for us when Swan's lamps were used in public for the first time at the Glasgow Exhibition in 1880, and then showed that he had such exceptional grip of the problems which presented themselves during the very early years of house-to-house supply, that I was able to nominate him as the engineer to the Bradford Corporation—the first municipal authority to deal with electrical supply.

After several years work at Bradford Corporation, he went to St. Pancras in 1895. St. Pancras had already laid down plant which Baynes completely remodelled. During his work at St. Pancras he was able to supply electrical energy for power purposes at the then very low figure of 2d. per unit, and by the year 1905 he again reduced the price to 1d.

In 1903 he was the first engineer of the Municipal authorities to lead the way to the adoption of three-phase, 5 000 V, 50 cycle a.c. transmission to sub-stations to the more distant parts of the borough.

In 1905 he was one of the first to adopt the Parsons turbine to replace the existing reciprocating engines, and in 1912 he persuaded his committee to adopt the first Brush Ljungstrom turbine sets of 10 000 kW each. Again, he was one of the first to interest himself in pulverised fuel.

Owing to ill-health he retired in December, 1927, and the Borough Council then placed on record their recognition of the great and distinguished services he had rendered to them during his long period of service.

Baynes, like Ferranti, was a man who did things, he did not talk about them; but he was a man for whose judgment I personally had the greatest respect, and I am one of those who most sincerely deplore his loss.—I am, etc.,

R. E. Crompton.

February 13th.

[To the Editor.]

Sir,—It was with deep regret that we heard of the recent death of Mr. Sydney W. Baynes, late electrical engineer to the St. Pancras Borough Council, whom we have had the pleasure of knowing intimately for nearly 60 years.

It may be of some interest to your readers to hear that Mr. Baynes received his original mechanical training when apprenticed to the late Mr. A. P. Lundberg, the founder of this firm, who was then in business in Bayswater.

He followed Mr. Lundberg when that gentleman accepted service under Col. R. E. Crompton, in Chelmsford, in 1878.—We are, etc.,

for A. P. Lundberg and Sons, Ltd.,
Gus C. Lundberg,
Director.

London,
February 13th.

BOOK REVIEWS.

Pioneers of Electrical Communication. By Rollo Appleyard. Macmillan and Co. Pp. 347. 21s.

Most of the memoirs included in this readable and well-illustrated volume were originally published in "Electrical Communication." Mr. Appleyard has been to the sources, both in England and on the Continent, for his material and his book will be a welcome addition to the libraries of all who are in any way interested in the early history of electricity and its practical application. Naturally, we were particularly interested by the facsimile reproduction of a letter addressed by Oliver Heaviside to Mr. Trotter, then Editor of The Electrician, dated December 5th, 1894, in which the rumblings of the great controversy between science and religion which raged in the second half of the nineteenth century are to be found.

"Fundamentals of Radio." Pp. xii+372. $3.50.
"Experimental Radio." Third Edition. Pp. xii+255. $2.75. By R. R. Ramsey. (Bloomington, Indiana: Ramsey Publishing Co.).

In the publisher's circular accompanying the former book it is called "an Elementary Text-Book for College Students"; and in the same circular "Experimental Radio" is described as "the standard radio manual in domestic and foreign laboratories." The reviewer fears that the one statement is as far from strict accuracy as the other.

The books are puzzling. From internal evidence here and there it is clear that the author does really know the subject; but yet neither of the books is at all useful—at any rate in this country. They convey the impression (perhaps quite erroneous) that they are the republication in book form of some articles on radio in the daily Press.

For example, in "Fundamentals of Radio" the radio detector is repeatedly referred to as a "square-law" instrument, in spite of the fact that all detectors for telephony should be (and some are) practically linear. It is stated that "motor-boating" is peculiar to resistance amplifiers. Many of the amplifier circuits illustrated and described have no grid bias. The theory of getting maximum output from a valve is apparently not understood. In connection with current measurement at radio frequencies, a current transformer thermo-couple instrument is mentioned, and it is stated "since this has a turn of wire, it cannot be used at very high frequency."

In "Experimental Radio," which purports to give instructions for experiments in academic laboratories, there is the same scrappiness and inaccuracy. In measuring the wave-length of a distant transmitter, we are told to "connect a buzzer to the wavemeter." What about the change of calibration? Instructions are given on bridge measurement of the inter-electrode capacities of valves without a word as to stray capacity difficulties. Amplifiers are shown again and again without grid bias.

NEWS IN BRIEF.

The Annual Dinner of the Batti-Wallahs—Electric Cookers in Manchester—Electrical Wages—Birmingham Corporation and the B.I.F.—Stoke-on-Trent and Local Exhibitions.

WINSLOW Board of Guardians proposes wiring the institution for electric light.

The Batti Wallahs' Society will hold a luncheon at the Hotel Cecil, London, on Thursday, March 6th, at 12.30 for 1 p.m. Sir Felix Pole will deliver an address. The annual dinner and dance of the society will be held at the Hotel Cecil on Friday, March 21st, 7 for 7.30 p.m. till 1 a.m.

Mr. A. A. Milne's clever detective play, "The Fourth Wall," was performed by the Metropolitan-Vickers Dramatic Society at the M.V. Club on four nights, beginning on February 5th. It was a very successful production, there being appreciative audiences at each of the four performances. It was well within the capacity of the efficient stage lighting equipment to deal with the simple interior in which this play is staged.

Eston Electricity Committee is acquiring premises at South Bank for electricity showrooms.

Hired cookers connected to Manchester Corporation's mains in December last numbered 119, making a total of 5 893 connected.

It has been reported to Portsmouth Corporation that the total number of electricity meters tested was 822, all of which were correct. These were all new meters.

Wimbledon electricity department is to carry out electrical work at the baths department's proposed new cycle store and dressing room in Latimer Road, at a cost of £84 10s.

Gellygaer U.D.C. on February 14th held an electric cooking demonstration at the Moose Hall, at Ystrad Mynach. Demonstrations in the use of other labour saving apparatus were also given.

Over fifty members of the Electrical Association for Women attended a recent lecture by Mr. G. S. Francis on "Plastic Lighting and Modern Architecture—Changing Styles in Cities and Homes," at the E.L.M.A. Lighting Service Bureau, London, with Mrs. Wilfrid Ashley in the chair. By means of slides Mr. Francis illustrated the development of architecture and the part lighting has played in this connection.

The Council of the Institute of Fuel invites competition for a medal, together with a prize of books or instruments to the value of £5, to be awarded annually for a paper submitted by a student member of the Institute. The paper must deal with some subject relating to the preparation or utilisation of fuel or allied subjects, which come within the purview of the activities of the Institute. Further particulars can be obtained from the Secretary, 53, Victoria Street, London, S.W.1.

Mr. I. S. Coggleshall, of the Western Union Telegraph Co., recently informed the American Institute of Electrical Engineers that coded telegraph messages can now be sent across the Atlantic at a speed of 2 500 letters per minute. and that further speed would soon be attainable through improvement of cable insulation, and that an immediate result of this would be the possibility of transmitting voice impulses as well as telegraph signals over the submarine cables.

Sir William Ray, speaking on "A Municipal Industrial Policy" at St. Stephen's Club, London, recently, said the policy of the Municipal Reform majority on the London County Council was to purchase in every possible case home productions, and, failing this, to give a preference to the productions of the British Empire. During the last three years, over 438 000 electric lamps had been purchased, and the Council limited its purchases to lamps which were made in this country from parts produced in this country.

About 150 members of the Institute of Municipal Engineers paid a visit to the works at Dagenham Dock, Essex, of Messrs. Pritchett and Gold and E.P.S. Co., Ltd. The visitors were taken through the whole process of battery manufacture from the refining of lead to the packing of the finished article.

Mr. C. H. Yeaman, city electrical engineer, Stoke-on-Trent, is to arrange for a series of exhibitions to be held in the town halls throughout the city during next autumn and to invite the co-operation of manufacturers of electrical apparatus and local electrical contractors. With regard to the question of holding an electrical exhibition at the Hanley Park Fetes, in July, 1930, inquiries are to be made as to what co-operation would be afforded by the electrical trade generally.

LOOKING BACKWARD.

FIFTY years ago it was recorded in THE ELECTRICIAN *of February 21st, 1880, that the Trustees of the British Museum were so satisfied with the electric light in the Reading Room that they had decided to order another dynamo from Siemens Bros., and permanently to adopt this new form of lighting.*

Oliver Heaviside was to read a paper on the Resistance of Galvanometers at the Society of Telegraph Engineers on February 25th.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of February 17th, 1905, published details of the scheme for electrification of the L.B. & S.C. Railway Company's suburban lines.*

The electric railway round the base of Mount Vesuvius had just been completed and the electric tramway from Castellamare to Sorrento was to be ready for opening in the spring.

At the eighth ordinary general meeting of the Marconi Wireless Telegraph Co., Ltd. (on February 16th, 1905), the chairman, Col. Sir Charles Euan-Smith, said that in England, H.M. Post Office was in close alliance with the company.

The Metropolitan Asylums Board is to renew the X-ray apparatus at High Wood Hospital, at an estimated cost of £350.

Eston Electricity Committee has asked the electrical engineer to report on the question of letting out domestic appliances on the hire-purchase system.

Colchester electricity department opened new showrooms in High Street on February 12th. There were demonstrations of cooking, washing, water heating, pumping, etc.

Copies of regulations for the supply and use of electricity in Johannesburg can be obtained from the Department of Overseas Trade, London. (Reference B. 6 134.)

"The Continuity of Wireless Waves" was the subject of a lecture given at the University College of the South West, Exeter, on February 3rd, by Prof. V. H. L. Searle, lecturer in physics at the college.

Mr. J. T. Wade, president of Fleetwood Chamber of Trade, recently urged traders to utilise the electricity bureau, opened by the Council, when requiring electrical equipment. Coun. C. A. Copeland said he did not approve of municipal trading at the expense of the private trader.

When the Property and Estates Committee of Oxford City Council recommended the appointment of an expert to report on the electric lighting system of the municipal buildings, Ald. J. Carter stated that it was time they put a stop to this expensive plague of experts. In two or three years they had spent the proceeds of a shilling rate in employing super-experts, and then they had to have their own experts to see that those experts did not make mistakes. The report was referred back.

In his report to the members of the Electrical Trades Union, the general secretary, Mr. James Rowan, refers to what he considers the inexplicable attitude taken up by employers in regard to the agreement recently signed between the employers' and workers' sides of the N.J.I.C. for certain rates of wages covering switchboard and sub-station attendants and their assistants. Employers, he says, have added on to the agreement certain qualifications which were not even mentioned at any of the meetings of the negotiating committee who drafted the report.

Birmingham Corporation has published, in connection with the British Industries Fair and for the general information of visitors to the city, "The City of Birmingham Handbook, 1929–30." It contains fine views of the Council House and other municipal buildings, educational establishments, baths, sanatoria, places of recreation, etc., and a mass of interesting matter describing these places, besides the University, the public health, education, gas, water, electricity supply and transport services, the city estates, markets and municipal bank, and a statement of the origin, objects and organisation of the British Industries Fair.

Digitized by Google

PERSONAL.

MR. S. Billington has been appointed manager of the city transport undertaking at Gloucester.

Mr. C. A. Pike, resident electrical engineer to the Penmaenmawr U.D.C., has been appointed manager of Carnarvon electricity works.

Right and left respectively, Mr. T. R. Martin and Mr. H. H. Berry, chairman and deputy-chairman of the Advisory Committee, Electrical Section, British Industries Fair. (See note on this page.)

Mr. J. Jones, of the Melksham branch of the West Wilts Electric Supply Co., has been presented with a Westminster chiming clock on the occasion of his marriage.

Rotherham Electricity Committee recommends an increase of the salary of the deputy electrical engineer, Mr. W. H. Duffett, from £900 to £1 000 per annum.

Plymouth Tramways and Transport Committee, having accepted the resignation of Mr. J. W. Eunson, has resolved to advertise for a rolling stock superintendent at a commencing salary of £400 per annum.

At the ordinary meeting of the Institution of Electrical Engineers to be held at 6 p.m. on February 27th, the Hon. Sir Charles A. Parsons, F.R.S., will present to the Institution an oil painting of Sir Joseph Wilson Swan.

Mr. F. F. Sharles has relinquished his appointment as secretary of Aeonic Radio. The Board of the company now consists of Sir William Kay (chairman), Sir Robert J. Lynn (deputy-chairman), Mr. J. L. Gottlieb and Mr. E. V. Kayley.

In connection with the illustration in the top left hand corner of page 213 in the February 14th issue a reproduction of a photograph of Mr. H. H. Berry appeared in error over the name of Mr. T. R. Martin. Mr. Berry is, of course, deputy chairman of the Advisory Committee, Electrical Section, British Industries Fair, and Mr. Martin, chairman.

Ilford Electricity Committee recommends that the salary of the deputy borough electrical engineer, Mr. G. F. Gregory, at present £700 per annum, be increased by £50 per annum, and the salary of Mr. H. King, assistant commercial manager, at present £500 per annum, by £25, rising subsequently by annual increments of £25 to £600 per annum.

Lieut.-Colonel Sir James Lithgow has been nominated as president-elect of the Federation of British Industries, in succession to Mr. Lennox B. Lee. Sir Arthur Duckham and Sir Hugo Hirst have been nominated as new vice-presidents. These nominations will come up for confirmation by the general meeting of members towards the end of March.

At the annual meeting of the Manchester and Salford District Branch of the Electrical Association for Women, last week, Lady Emmott was elected president; Mrs. S. Z. de Ferranti, Mrs. A. P. M. Fleming, Lady Longbottom, Mrs. E. D. Simon and Miss Ellen Wilkinson, M.P., vice presidents; Mrs. J. Harcourt Williams and Miss D. Foster Jeffery, hon. secretaries and Miss O. M. Forbes, hon. treasurer.

Obituary.

MR. ALAN ARCHIBALD CAMPBELL SWINTON, F.R.S., on Wednesday, in his 67th year. Memorial service at St. Michael's Church, Chester Square, London, S.W., to-morrow, Saturday, at 2.30 p.m.

MR. MICHAEL BIRT FIELD, on February 15th. He was appointed chief electrical engineer to Glasgow Tramways Department in 1900 and later became chief engineer. From 1912 to the time of his death Mr. Field was managing director of Kelvin, Bottomley and Baird, Ltd.

BUSINESS ITEMS.

THE GENERAL ELECTRIC CO. (INDIA), LTD., announces the opening of new branches at 7, Brigade Road, Bangalore, Mysore State, and Main Road, Trivandrum, Travancore State.

OERLIKON, LTD., have removed to Victoria House, Southampton Row, London, W.C.1.

The telephone area at Dudley is now converted to full automatic working, and the new exchanges comprised in the area are Dudley (1 300 lines), Brierley Hill (500 lines), Cradley Heath (600 lines), and Stourbridge (1 100). These new exchanges supersede the old rotary system at Dudley and manual switchboards at each of the other exchanges, and now provide a full automatic service for the area. The new equipments were made and installed by SIEMENS BROTHERS AND CO., LTD., and are of their No. 50 non-director type.

Automatic and toll exchange in Pisa was inaugurated on February 9th, and successfully cut over. This exchange equipped for 1 200 sub-lines and 32 toll lines is of the 7 D rotary automatic district system and the first of its kind to be installed in Italy. It is equipped for automatic toll switching and provided with 50 cycle long distance dialling system for local and transit toll connections. Pisa Exchange is centre exchange of Pisa district which includes 10 district rural exchanges to be put into service this year. Pisa is in fourth zone; the concessionary company being Societa Telefonica Tirrena from whom the order was received by Standard Elettrica Italiana.

In connection with the £100 Radio Week Window Display Competition, organised by the MARCONIPHONE CO., LTD., the prizes were allotted as follows:—1st Prize, H. Sayner, 28-30, Saltaire Road, Shipley; 2nd Prize, R. Barker and Co., Ltd., 4, New Station Street, Leeds; 3rd Prize, Neal and Bacon, 64, St. Benedicts, Norwich; 4th Prize, Tamplin and Makovski, Bell Street, Reigate; Robert Hazelton, Woodhouse Street, Portadown; Radio House, 17, Union Street, Plymouth; Guy V. Laycock, 12, Cloth Hall Street, Huddersfield. Highly commended: Fred. G. Fuzzey, Ltd., High Street, Guernsey, C.I.; A. H. Dykes, 8, Bury Street, Stowmarket; Jack Hubble, 2, Market Buildings, Maidstone; Paul Taylor, 1, Silver Street, Kettering; Clarkes Cash Chemist, 65, High Street, Newport; Paterson Sons and Co., Ltd., 152, Buchanan Street, Glasgow; Parker and Smith, 3, Bedford Street, Plymouth; Trojan Electrical Co., 12, Alexander Road, Manchester; Western Radio and Supplies, Ltd., 10, Working Street, Cardiff; F. W. Wood, Ltd., 24A, Bull Ring, Grimsby; Duck Son and Pinker, Ltd., Pulteney Bridge, Bath; The Signal Shop, 7, York Buildings, Bridgwater; Kenneth Levell, King's Head Arcade, Cloth Hall Street, Huddersfield; City Radio and Cycle Stores, 17, Queen Street Arcade, Cardiff; Atkinsons, 103, Falsgrave Road, Scarborough; Barnes and Avis, Ltd., 5, Duke Street, Reading; Calvert and Heald, Market Street, Lancaster; Lawtons, 10, Mill Street, Crewe; E. Upton and Sons, 175, Linthorpe Road, Middlesbrough; Hunt and Co., 26, Stodman Street, Newark.

The appearance of a new accumulator manufacturer will be of general interest to the electrical industry. We have received a catalogue of stationary lead batteries from BRITANNIA BATTERIES, LTD., who have recently established at Redditch, near Birmingham, a factory where they are undertaking the production, on an extensive scale, of accumulators and batteries of a large variety of types. Besides lead accumulators of all types and sizes, Britannia batteries are manufacturing nickel-iron-alkaline accumulators for Edison Accumulators, Ltd. The Pertrix dry battery is also made at Britannia works. The Britannia lead accumulators are based on the designs of the A.F.A., whose practical and technical experience extending over forty years, are utilised and every process of the manufacture is controlled with such care that the makers state that a product of uniform and reliable quality can be depended upon. The stationary batteries described in the catalogue before us, besides being built in accordance with modern practice, include a number of improvements. The wood separators are supported by ebonite rods, and an improved process of casting the positive plates, claims to eliminate buckling to a large extent. The depth of the boxes is increased, allowing more mud space below the plates and more acid space above. The larger cells in glass boxes are mounted in double boxes, which reduces the risk of breakage of boxes. This catalogue will shortly be followed by others dealing with motor-car startor batteries, vehicle batteries, wireless batteries, and other types which are being developed by the company.

F.B.I. AND EMPIRE TRADE

Views on British Economic Policy with Regard to the Dominions.

THE Federation of British Industries has issued a lengthy memorandum this week on British Economic Policy with regard to the Dominions. It takes the view that the most urgent necessity exists for this country to take all possible steps to increase trade with the Dominions, taking into account the economic desires of the Dominions and the importance of Empire migration. The memorandum expresses the opinion that the present Imperial machinery for consultation upon economic questions is unsatisfactory, and inferior to that which the Economic Section of the League of Nations affords for discussing economic problems with foreign countries.

The holding of an Imperial Trade Conference composed of government officials, representatives of industry (employers and employed), and of commerce, finance, shipping and agriculture, to review every question affecting inter-Imperial trade is suggested. This conference should not be an isolated effort but a permanent part of Imperial economic machinery. The establishment of an Imperial economic secretariat is also advocated. Meanwhile it is suggested that steps be taken to "rationalise" Empire industrial production, that there should be a closer liaison between the United Kingdom and Dominion industries and that existing preferences granted by Great Britain to the Dominions should not be disturbed. Other recommendations relate to the elaboration of a system of information in regard to Empire sources of supply, the establishment of an Empire College for Overseas students in London and the provision of further financial facilities for the furtherance of air transport within the Empire.

ELECTROPLATERS' EXHIBITION.

Interesting Examples Illustrating the Progress of Chromium Plating.

A CONVENTION was held recently by the Electroplaters' and Depositors' Technical Society at the Northampton Polytechnic Institute, Clerkenwell. An interesting feature was an exhibition representing modern scientific and practical advances in electro deposition. The exhibition was illustrative of the great developments which have occurred in the technique of metal deposition in the past few years. The evening meeting was addressed by Dr. W. Rosenhain, F.R.S., of the National Physical Laboratory, Teddington, the subject of his talk being "Research and Practice." The evening session was devoted to a discussion on the "Present Position of Chromium Plating," there being a large attendance. Dr. R. S. Hutton, director of the British Non-Ferrous Metals Research Association, and president of the Electroplaters' and Depositors' Technical Society, was in the chair. The exhibition represented practically every phase of electro-deposition art and science. The modern note in decorative plating was struck by the many beautiful exhibits of chromium plating. The exhibits of Messrs. Canning and Co., Ltd., Messrs. Crauer and Weil, Messrs. J. Nixon and Co., the Matchless Motorcycle Co., and the Kings Cross and Attwood Plating Co., illustrated how far the chromium plater has gone in solving the problem of the poor "throwing power" of the chromium plating solution. The Royal Aircraft Establishment (Farnborough) exhibited examples of zinc and cadmium plate upon aluminium. In this repsect the exhibit of Mr. U. R. Evans was very interesting. This consisted of deposited and other coatings upon iron after they had been submitted to corrosion tests. The Royal Aircraft Establishment also exhibited samples of aluminium to which the anodic process had been applied, together with specimens of the film of aluminium oxide which had been separated, the thickness of which was as little as one eighty-thousandth of an inch. A special exhibit was sent by Dr. Mueller from the Physikalish-Technisches Reichsanstallt, Charlottenburg, Berlin, and consisted of gold and nickel foil in films less than a millionth of an inch in thickness. Messrs. Thomas Try, Ltd., showed some examples of built up engineering parts in electro deposited nickel and iron deposits as thick as ¼ inch, these being perfectly adherent to the base metal and sound in structure. The Standard Plating and Kupron Works and the British Metallising Co. showed deposits of porcelain, plaster, glass, vulcanite, and cellulose acetate. Deposits of platinum and palladium illustrative of precious metal deposition were shown by Messrs. Johnson, Matthey and Co., Ltd. The Research Department, Woolwich, supplied an exhibit illustrating the X-ray spectra of deposited nickel.

LEGAL INTELLIGENCE.

Well-known Plug and Socket Patent Subject of Action.

IN the Chancery Division on February 11th Mr. Justice Clauson began the trial of an action by Messrs. Albert Edward Chapman and Charles Reginald Cook and Lectro Linx, Ltd., London, S.W., against the Deltavis Co., of Voleure, Switzerland, for an injunction restraining the alleged infringement of the plaintiffs' Patent No. 231280 for improvements in electric coupling terminals and the like. The plaintiffs also asked for delivery up for destruction of the alleged infringing articles and damages.

Infringement was denied and the defendants pleaded that the patent was invalid on the grounds of prior publication and prior common general knowledge.

Mr. Rudolph Moritz, K.C., for the plaintiffs, said at the date of the issue of the writ the registered owners of the patent were the first two plaintiffs, but it was afterwards assigned to the third plaintiffs. On the plea of invalidity the issues raised were want of novelty, want of subject matter, and inutility.

The patent dealt with small electrical connections. Since the introduction of wireless broadcasting all sorts of devices had been used for the purpose of making connections and one of the developments was the use of cylindrical and conical slotted pins. It was thought that a split pin would make a tight joint, but practice proved otherwise. In the particulars of objection filed by the defendants there was shown a variety of ways of reaching the same result but it was the plaintiffs' method that solved the problem and was now a commercial success. The contention of the defendants was that the plaintiffs were claiming a patent for a coupling which consisted of a plug and socket and not for a pin alone which they alleged invalidated the patents. But he submitted that the pith and marrow of the invention was the two-ended suspension of the hollow centre of the pin or plug and that there was infringement even if the plug was omitted. In support of their plea of lack of novelty and subject matter the defendants, said Mr. Moritz, had cited prior specifications of Shiels, Stott, a Dutch company, Pellant, Arnold and Bosch.

Mr. James Swinburne, consulting engineer, and other expert witnesses, gave evidence in support of the plaintiffs' case.

The Defence.

Mr. J. Whitehead, K.C., opening the case for the defence, said what the patentee claimed was a spigot made on a new and fundamental principle. But it had been clearly laid down by the House of Lords that if a patentee was seeking to make use of a so-called new principle to catch infringement, it must be made plain in the specification that it was the principle that was being claimed. Yet nowhere in the plaintiffs' specification was the principle pointed out. There were claims to a plug and socket and to variants of a socket, but there was no statement or illustration in the specification describing or showing the use of a plug as a valve pin. Mr. Whitehead said that the pith and marrow of the invention claimed was the provision of a plug and socket contact formed as a single unit and provided with leading-in means.

Mr. Hubert Alexander Gill, consulting engineer and a chartered patent agent, then gave expert evidence.

Mr. Trevor Watson, junior counsel for the defendants, in summing up their case said, on the question whether the Deltavis pin infringed the plaintiffs' patent, an attempt had been made by the plaintiffs to show that although the Deltavis pin was not an infringing article when made, it might, by being pressed into a parallel-sided socket, become an infringing article by compression. But there was no evidence that the defendants had ever put one of their plugs into a socket. If such plea was of any avail it would be against the user and, against the user only.

Mr. Moritz replied on behalf of the plaintiffs.

Giving judgment his lordship said that in his view of the construction of the plaintiffs' specification he could not hold that the claim was one for a coupling formed of a plug and socket as a unit and also as a claim to a monopoly for a particular form of plug. If the invention related to a plug and socket as a single unit with modifications he could understand it, but the patentee had told them of no invention except that which was comprised in a combination of a socket and pin. Therefore there was no grant of a monopoly for a particular form of pin and on that view, said his lordship, there was no infringement, and the action must be dismissed with costs.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BARRHEAD CORPORATION.—Electric lighting work in connection with erection of 70 houses under No. 2, Arthurlee Site housing scheme. Schedules, etc., from the Town Clerk, Municipal Buildings, Barrhead.

CENTRAL ELECTRICITY BOARD, February 22nd.—Transformer oil-treating plant for 18 transformer stations in the area of the Central England Scheme. Specification (No. B.E.—P.S. 2), etc., from Mr. R. E. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Prepayment Meters.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 24th.—Supply of prepayment meters. Specification from Mr. D. J. Keep, town clerk, Town Hall, Cambridge Road, London, E.2; deposit £2 2s.

BRENTFORD GUARDIANS, February 26th.—Provision of central switchboard and laying of electric mains, at West Middlesex Hospital, Isleworth. Specification, etc., from Messrs. Dodge and Reid, 120, High Street, Brentford; deposit £1 1s.

BRISTOL CORPORATION, February 26th.—Six months' supply of electrical fittings. Particulars from Mr. T. S. Lamb, clerk, St. Peter's Hospital, Bristol.

CROYDON CORPORATION, February 26th.—Six months' supply of electrical fittings and appliances, etc. Specification, etc., from the Union Offices, Mayday Road, Thornton Heath. Stamped, addressed envelope to be sent.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 26th.—Twelve months' supply of electric lighting sundries, insulated wires, ordinary and prepayment meters, insulating compound; h.t. and l.t. concentric, paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer, 85, Fulham Palace Road, London, W.6.

ASHFORD (KENT) URBAN DISTRICT COUNCIL, February 28th.—Vertical, solid injection, heavy oil engine, with alternator (about 900 kW), suitable for 6 600 V, three-phase, 50 periods. Tenders to Mr. J. Sudlow, clerk to the Council, High Street, Ashford.

GLASGOW EDUCATION AUTHORITY, February 28th.—Electric light installations in Globerhill Temporary, Rotherwood Avenue, and Knightswood Schools and in Govan Secondary School extension, Langlands Road, Govan. Specifications, etc., from Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s. per specification.

WEST RIDING EDUCATION COMMITTEE, February 28th.—Electric light installation in Southowram Withinfields Council School. Specification, etc., from Mr. G. Dodgson, Education Office, Huddersfield Road, Elland.

LITTLEHAMPTON URBAN DISTRICT COUNCIL, March 1st.—Supply and installation of automatic operating, electrically driven air compressor. Specification, etc., from the Engineer, Town Offices, Littlehampton.

OXFORD CORPORATION, March 1st.—Manufacture and erection of engines and pumps, including two oil-driven auxiliary engines each driving an electric generator; electric light installation, etc. Specification, until noon on March 1st, from Sir A. Binnie, Son and Deacon, Artillery House, Artillery Row, Westminster, S.W.1; deposit £10.

CENTRAL ELECTRICITY BOARD, March 3rd.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme. Specification (No. S.E.E.—P.F. 5) from the secretary and solicitor, Mr. R. H. Fox. Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

DOVER HARBOUR BOARD, March 3rd.—Twelve months' supply of electric cables, electrical sundries, etc. Schedules, etc. (2s. 6d.), from the office of the Register, Castle Street, Dover.

HALIFAX CORPORATION, March 3rd.—Electrician's work at public conveniences. Specification, etc., from the Borough Engineer, Crossley Street, Halifax; deposit £1 1s.

HOVE CORPORATION, March 3rd.—Supply of electric lamps, etc., for one year. Forms of tender from the Town Clerk.

SOUTHEND CORPORATION, March 3rd.—Twelve months' supply of stores, including meters and instruments, electrical fittings, cables and steel conduits, joint boxes, earthenware conduits, etc. Specification, etc., from the Borough Electrical Engineer and Manager, Electricity Works, London Road, Southend-on-Sea.

WESTHOUGHTON URBAN DISTRICT COUNCIL, March 3rd.—One year's supply of stores, including metallic filament lamps. Forms of tender, etc., from the Surveyor, Town Hall, Westhoughton. Stamped, addressed envelope to be sent.

CAMBRIDGE CORPORATION, March 4th.—Twelve months' supply of stores, including electric lamps (schedule 16). Forms of tender, etc., from the Borough Engineer, Guildhall, Cambridge.

ALLOA CORPORATION, March 6th.—Electrical installation in connection with erection of 63 houses at Broad Street, Alloa. Schedules from Messrs. J. Melvin and Son, architects, Mar Street, Alloa.

LEICESTER CORPORATION, March 7th.—Installation of electric light wiring and fittings at Belgrave pumping station. Specifications, etc., from the City Surveyor, Town Hall, Leicester; deposit £1.

EDINBURGH CORPORATION, March 8th.—Supply and maintenance of telephones, in Edinburgh, Leith and Portobello districts. Forms of tender, etc., from the City Architect, City Chambers, Edinburgh.

BEDFORD CORPORATION, March 10th.—Supply during one year of e.h.t., h.t. and l.t. underground cables; and incandescent lamps. Specifications from the Borough Electrical Engineer, Prebend Street, Bedford. Tenders from British manufacturers in the United Kingdom only are invited.

BLACKBURN CORPORATION, March 10th.—Manufacture and supply of electrical requirements for 12 months, including paper insulated, lead sheathed cable, rubber insulated wire, consumers' meters and gasfilled and vacuum incandescent lamps. Specification, etc., from the Engineer and Manager, Electricity Offices, Town Hall, Blackburn; deposit 10s.

CHEDDLESTON (LEEK) MENTAL HOSPITAL, March 10th.—Supply of electric lamps for six months. Tender forms from the clerk and steward, Mr. F. G. Eve.

PRESTWICH URBAN DISTRICT COUNCIL, March 10th.—Twelve months' supply of lamp standards, electric lamps, etc. Forms and tender, etc., from Mr. H. T. Ainsworth, surveyor, Town Hall, Prestwich, Lancs.

TORQUAY CORPORATION, March 10th.—Supply and erection of 7 500 kW m.c.r. turbo-alternator and condensing plant Specifications, etc., from Mr. G. J. Hollyer, Electricity Offices, Torquay; deposit £3 3s.

LIVERPOOL CORPORATION, March 12th.—Supply of 5 000 kVA, 12 500 kVA and 33 000 V step-down transformers and 6 000 V and 3 3000 V metal-clad switchgear for sub-stations. Specification, etc., from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, March 19th.—Coal-handling plant at Ironbridge generating station. Specification (No. 8), etc., from Mr. E. F. Hetherington, Phœnix Buildings, Dudley Road, Wolverhampton.

EDINBURGH CORPORATION, March 24th.—Twelve months' supply of materials, including underground insulated cables, conduits, house service fuse boxes and fuse boards, electrical material for interior wiring, electricity meters, etc. Specifications, etc., from the Engineer and Manager, Electricity Department, Dewar Place, Edinburgh.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1.

Note.—An asterisk denotes that local representation is, in practice, essential.

MEATH COUNTY COUNCIL, February 15th.—Electric lighting and heating installation in Trim Courthouse building. Specification, etc., can be seen at the County Surveyor's Office, County Hall, Navan.

SOUTH INDIAN RAILWAY CO., LTD., February 21st.—Supply of wood sheet separators for train lighting cells. Specification etc. (5s.), from the company's offices, 91, Petty France, Westminster, S.W.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of primary battery material. (Reference B.X. 6 139.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of telephone switches. (Reference B.X. 6 018.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Reference B.X. 5 941.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of switchboard plugs (schedule C. 548). (Reference B.X. 5 998.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Supply of magneto and common battery telephones and automatic dials (schedule C. 544). (Reference B.X. 5 999.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

INDIAN STORES DEPARTMENT, February 27th.—Inert cells (to Indian Telegraph specification No. 2A, revised March, 1928), and Carsac elements (spec. No. 3, approved July 2nd, 1929). (Reference B.X. 6 165.)

GOTHENBURG HARBOUR AUTHORITY, March 3rd.—Supply of ten electrically operated 2½-ton portal cranes. (Reference A.X. 9 089.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 4th.—Supply of automatic exchange power boards (schedule C. 562). (Reference B.X. 6 072.)

INDIAN STORES DEPARTMENT, March 5th.—Supply of battery charging motor generator set, for Wireless Section (schedule No. 880 R/1). (Reference B.X. 6 146).

NEW ZEALAND POSTS AND TELEGRAPHS, March 5th.—Supply of v.i.r. wire (specification No. P. and T. 151/2 096). (Reference B.X. 6 089.)

VICTORIAN ELECTRICITY COMMISSION, March 10th (extension of time).—Two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

MOROCCO POSTS AND TELEPHONES (FRENCH ZONE), March 11th.—Supply of glass insulators, bronze and copper wire and galvanised ironwork. (Reference B.X. 6 410.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, April 3rd.—Supply of eleven 4-ton electric cranes for Durban Harbour. (Reference A.X. 9 119.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, April 30th.—Supply and erection of h.t. overhead transmission lines in isolated basins of Upper Egypt. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1; £10 5s., not returnable.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

Tenders Accepted.

GLASGOW CORPORATION.—Metro-Vick Supplies, supply of 2 000 Cosmos traction lamps to the tramways department.

LONDON, MIDLAND AND SCOTTISH RAILWAY CO.—Metro-Vick Supplies, supply of Cosmos electric lamps for 12 months (part contract).

SUTTON COLDFIELD CORPORATION.—General Electric Co., Ltd., supply of paper insulated, lead sheathed, double steel tape armoured cables, £12 543.

GREEK GOVERNMENT.—Siemens and Halske Akt.-Ges., installation and exploitation of automatic telephones in Athens, Piræus and the suburbs.

LONDON, MIDLAND AND SCOTTISH RAILWAY CO.—Siemens Electric Lamps and Supplies, Ltd., supply of Siemens vacuum and gasfilled electric lamps for 12 months.

BRADFORD CORPORATION.—English Electric Co., Ltd., rewinding 100 tramcar motors for 50 express cars and supply of spare motor for railless trolley vehicles, £205.

LIVERPOOL CORPORATION.—Thomas Bolton and Sons, Ltd., supply of 5 000 35 in. copper bonds, 2s. 6½d. each; British Insulated Cables, Ltd., supply of 300 65 in. copper bonds, 4s. each.

MANCHESTER CORPORATION.—Waygood-Otis, Ltd., inspection and maintenance of electric lift at High School of Commerce; Maitland and Co., Ltd., electrical installation at Princess Road motor bus garage.

Lamp Supplies.

ADMIRALTY.—Edison Swan Electric Co., Ltd., supply of 100 V 40 W, 100 V 100 W, and 230 V 25 W pearl, and 220 V 150 W clear lamps; Metro-Vick Supplies, supply of Cosmos vacuum and gasfilled metal filament lamps (part contract).

BRISTOL CORPORATION.—Johnson and Phillips, Ltd., supply of eleven outdoor weatherproof sheet steel transformer pillars, each to control a 150 kVA transformer and to be supplied complete with e.h.t. switchgear and distribution gear for five l.t. circuits.

CENTRAL ELECTRICITY BOARD.—Ferranti, Ltd., Fuller Electrical and Manufacturing Co., Ltd. and General Electric Co., Ltd., supply of 132 kV transformers in the area of the Mid-East England electricity scheme. The contracts amount to a total of approximately £150 000.

GENERAL POST OFFICE.—Electric lift, Wigan Telephone Exchange, W. Wadsworth and Sons, Ltd.; motor generator, Central (London) Telephone Exchange, Haslam and Newton, Ltd.; power plant, Valentia Radio Station (County Kerry, I.F.S.), Davey, Paxman and Co., Ltd.; Telephone exchange equipment, Maida Vale, Siemens Bros., and Co., Ltd.; Acorn (Acton), Standard Telephones and Cables, Ltd.

CAPE TOWN CORPORATION.—Roger Jenkins and Co., Ltd., supply of 200 cast iron pole bases, £213 2s. 8d.; Steel Trading Co., S. A., Ltd., 1 500 weldless steel tubular poles, £6 375; S. A. General Electric Co., Ltd., supply of switchgear for Dock Road power station, £330; British Insulated Cables (S.A.), Ltd. (£1 094 5s.), Hubert Davies and Co., Ltd. (£591), and Davis and Soper, Ltd. (£844 5s.), overhead materials. (All recommended.)

PORTSMOUTH CORPORATION.—Supply of switchgear:—English Electric Co., Ltd., £41 760 (recommended). Alternative tender submitted £40 191. Other tenders: Switchgear and Cowans, Ltd., £45 537 5s.; Ferguson, Pailin, Ltd., £40 191 and £41 766; British Thomson-Houston Co., Ltd., £44 961 11s.; Metropolitan-Vickers Electrical Co., Ltd., £44 945; Johnson and Phillips, Ltd., £48 012 5s.; General Electric Co., Ltd., £41 913; A. Reyrolle and Co., Ltd., £44 113 2s. and £42 460 2s.; Park Royal Engineering Co., Ltd., £41 472; New Switchgear Construction Co., Ltd., £48 844.

GLASGOW CORPORATION.—Malcolm and Allan, Ltd., electrical work of observation ward, Belvidere Hospital, £889; Barr and Co., two motors (new), including reconditioning vacuum plant, £192; Edison Swan Electric Co., Ltd., 140, Sangamo type current meters (new), £288; J. L. Saunders and Co., Ltd., three motors (new), including reconditioning oil burning plant, £198; Corporation Electricity Department, about 240 yards of 0·25 four-core l.t. a.c. cable, laid complete, £560; Metropolitan-Vickers Electrical Co., Ltd., new turbo-alternator and spares, £41 867, subject to a deduction from offer in respect of spares for condensing plant; G. and J. Weir, Ltd., condenser and spares, £9 448.

LIVERPOOL CORPORATION.—Equipment, etc., for Clarence Dock power station: Tudor Accumulator Co., Ltd., two control batteries, £2 928; British Thomson-Houston Co., Ltd., 3 300 V and 400 V armour-clad switchgear, and low-voltage lighting and power distribution boards, £11 100; Lancashire Dynamo and Motor Co., Ltd., two battery-charging motor generators, £477; E.P.I., Ltd., cable work in connection with auxiliary switchgear and lighting, telephones, call signals, heating etc.; Metropolitan-Vickers Electrical Co., Ltd., supply and erection of 50 000 kW m.c.r. turbo-alternator, with accessories, £187 870; British Thomson-Houston Co., Ltd., supply and erection of auxiliary switchgear at power station, to form part of the main switchgear (sections 1 and 3 of Corporation specification), at *pro rata* price to value of contract for main switchgear, estimated cost, £9 800. (All recommended.)

RURAL ELECTRIFICATION.

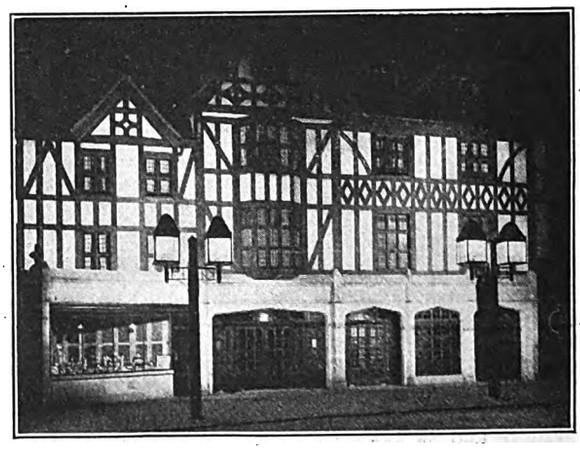
Description of Bedford Demonstration Scheme Issued by Commissioners.

THE Electricity Commission has issued a description of what is known as the Bedford Demonstration Scheme, prepared as the outcome of a request by the Minister of Transport in 1927, that the Commissioners should make investigations to see whether it was possible to proceed with the electrification of rural areas more rapidly than had hitherto been considered as possible. It was stated in the ninth annual report of the Electricity Commissioners that a demonstration scheme for a selected area forming part of the authorised area of supply of the Corporation of Bedford was prepared with the approval of the Minister and in collaboration with the corporation, and the present memorandum has been published in view of inquiries received from authorised undertakers and others interested in the development of the supply of electricity in rural areas.

The object of this scheme is to provide for the comprehensive and rapid electrification of a typical rural area where mixed farming is the main industry and electricity has not been previously available, so that within a period of about two years supplies for all purposes will be within the reach of practically all the inhabitants. The scheme will thus serve as a local demonstration of the advantages of rural electrification and of the possibility of more rapid development than has hitherto been regarded as economically possible. The main demonstration area is 101 square miles in extent with a population (based on the 1921 Census) of 15 860, and 4 038 occupied dwellings. The average density of the population is thus 157 per square mile, or practically the same as the general average of 151 per square mile for all rural areas in England and Wales. About three-quarters of the land is cultivated, a large proportion being devoted to corn raising, while the remainder is largely pasture. The area contains two brickworks which are already connected to the supply system of the corporation and account for a substantial consumption of electricity; and other small industries may become consumers in due course. Public supplies of gas are available in only three of the villages.

The technical scheme for the development of the demonstration area is based upon a supply of electricity in bulk obtained from Bedford, which occupies a fairly central position in relation to the area and is a "grid" point under the South East England Electricity Scheme. It involves the construction, in the main area, of network of about 56 miles of three-phase overhead transmission lines at 11 000 V. In completing the circuit, use will be made of about seven miles of existing underground cable which runs from Bedford to Sandy, and also of one or two other existing lines. Smaller villages, isolated residences and farms are to be supplied from single-phase extensions, these extensions representing a further 87 miles of 11 000 V overhead lines. The voltage of transmission at Bedford has hitherto been 6 600 V, but provision has been made in the scheme for stepping up from 6 600 V to 11 000 V at four transforming points, namely, Wootton Pillinge, Harrowden, Bromham and Milton Ernest. At these points either brick-built sub-stations or kiosks of simple and inexpensive design are contemplated, the transformer equipment having a capacity of 500 kVA in three cases and of 200 kVA in the other. Supplies to villages and isolated consumers will be given by means of pole transformers of the following proposed standard sizes, namely, 50, 20 and 10 kVA for three-phase, and 20, 10 and 5 kVA for single-phase supplies. With regard to low tension distribution in villages, involving about 45 miles of lines, it is anticipated that in most cases a neat overhead system which does not interfere with the amenities will prove possible; but a margin has been allowed in the estimates in case a certain amount of underground distribution should prove necessary in some instances. The voltage adopted for distribution is 400/230 V.

It is contemplated that the whole of the transmission system will be constructed within two years, the first of which has been designated "constructional year." Thereafter the only additional capital expenditure will be that incurred in connecting new consumers. The total capital cost for the main area, including all service connections and meters on consumers' premises, is estimated to be £116 250. It is estimated that by the end of six years from the commencement of supply about 75 per cent. of all the dwellings in the demonstration area will be connected to the supply system, and that the sales of electricity will have grown by that year to an average of about 130 units per head of population in the area. Estimates of revenue are based on the assumed adoption of an attractive two-part tariff for domestic supplies, and of suitable alternative flat rates for consumers taking supplies for lighting and/or power only. These charges are estimated to yield an average revenue from all classes of supply taken collectively of 2·4d. per unit sold. After providing for interest on bank overdraft, the estimates show deficits on net revenue account in the constructional year and the first two years of operation, but surpluses in each of the years thereafter sufficient to place the scheme on a remunerative basis in the course of a few years of working. Preliminary plans for the lay-out of the transmission system have been approved and supplies are already being given in ten parishes. It is anticipated that a supply will be available by the early part of 1931 in the whole of the area.



TWO views of the Plough Inn, Clapham, London, S.W., showing a close-up of the specially designed G.E.C. floodlighting units and the effect they produce.

WORK IN PROSPECT.

BARNSLEY.—New hotel at Kendray Estate. Particulars, H. Raper, Oakwell Brewery, Barnsley (architect).

CHESTERFIELD.—School to cost £18 666. Particulars, the Director of Education.

COSELEY.—School. Particulars, Messrs. Scott and Clark.

CROYDON.—Houses (20). Particulars, Truett and Steel, Ltd., Thornton Heath.—Additional 364 houses. Particulars the Borough Engineer.—Baths, public washhouses, laundry, etc. Particulars, the Borough Engineer.

DEWSBURY.—Laying new cables, for T.C. Particulars, H. Dearden, Town Hall, Dewsbury. (Estimated cost, £45 000.)

DONCASTER.—Proposed new electric mains (£3 680). Particulars, F. O. Kirby, Priory Place, Doncaster.

DONCASTER.—Various school extensions. Particulars, R. E. Ford, Priory Place, Doncaster.

HALIFAX.—Electric light installation to school, Withinfields, Southowram. Particulars from G. Dodgson, Huddersfield Road, Elland.

HATFIELD.—50 new houses, for Mr. Dunn. Particulars, E. C. Dunn, builder, Hatfield, near Doncaster.

KNOTTINGLEY.—Additions to the Grange. Particulars from R. A. Easdale and Son, County Chambers, Castleford.

LLANGEITHO.—Police station. Particulars, Mr. T. Owen, Aberystwyth, county surveyor.

MIDDLESBROUGH.—Houses (100). Particulars, Gilbert Long Ltd.

MIDDLESBROUGH.—Houses (104). Particulars, the Borough Surveyor.—Church, Whinney Banks Estate. Particulars, the Vicar of Acklam.

OLD FLETTON.—School. Particulars, the County Surveyor, Huntingdon.

PETERBOROUGH.—Housing scheme (20). Particulars, the Surveyor.

PONTEFRACT.—Electrical installation to 24 houses. Particulars from J. E. White, Tanshelf House, Pontefract.

PONTEFRACT.—Erection of 16 houses, for U.D.C. Particulars from Tennant and Smith, Ropergate, Pontefract.

RICCALL.—New school, for C.C. Particulars, J. H. Carr and Sons, builders, Selby.

ROTHERHAM.—Housing scheme (440). Particulars, the Borough Engineer.

ROTHERHAM.—New public library for B.C. Particulars, V. Turner, borough surveyor, Town Hall, Rotherham.

SCARBOROUGH.—Extensions to town hall. Particulars, H. W. Smith, borough engineer, Town Hall, Scarborough.

SKELMANTHORPE.—Eight new houses, for U.D.C. Particulars from H. Lodge, Huddersfield Road, Skelmanthorpe.

STANFORD-LE-HOPE.—School (250 places). Particulars, Mr. W. O. Lester Smith, Chemlsford.

STIRLING.—Housing scheme (52 to 64). Particulars, the Burgh Surveyor.

STOCKPORT.—Houses (118). Particulars, Thomas Davies and Son.

ASSOCIATION OF SUPERVISING ELECTRICAL ENGINEERS.

Among the guests who have accepted invitations to be present at the annual dinner of the Association of Supervising Electrical Engineers, to be held at the Hotel Cecil to-morrow evening, are :—

Col. Sir T. P. Purves, Sir Archibald Page, Mr. W. W. Lackie, Mr. V. Watlington, Mr. P. Rosling, Col. R. E. Crompton, Sir Wm. Noble, Mr. P. V. Hunter, Mr. G. Scott Ram, Mr. J. M. Kennedy, Mr. A. P. Thurston, Mr. G. Lathan, M.P., and Mr. E. J. Evershed.

Mr. S. B. Donkin, president of the Association, will be in the chair, and he will be supported by two past presidents, Mr. J. S. Highfield and Mr. A. M. Sillar.

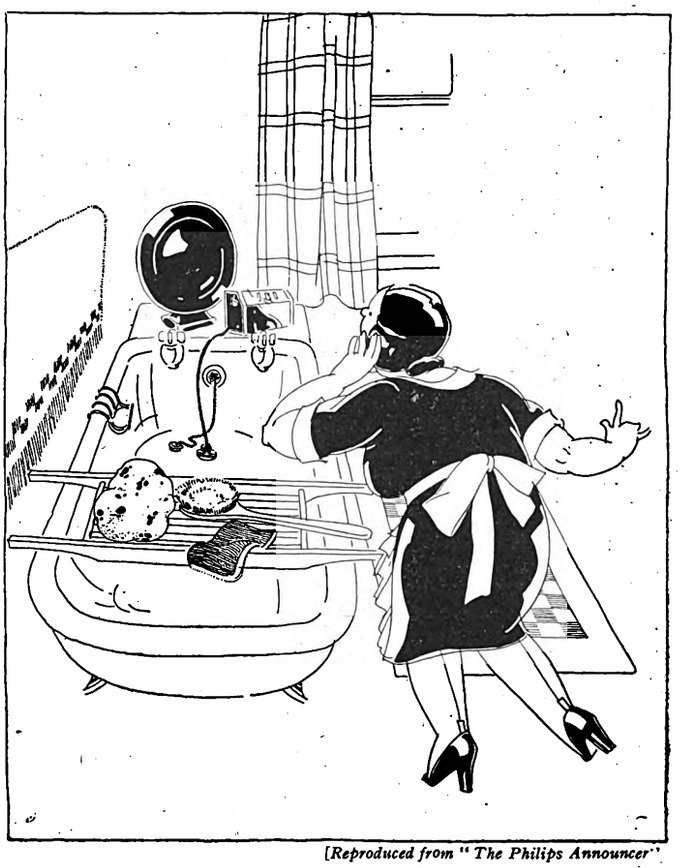
EX-BRITISH WESTINGHOUSE ASSOCIATION.

The 12th re-union dinner of the Ex-British Westinghouse Association will take place on Friday, March 14th, at the Hotel Cecil, London, with Mr. J. S. Peck in the chair. Dinner tickets (12s. 6d.) can be obtained from the hon. treasurer, Mr. L. S. Hawes, 51, Fontenoy Road, Balham, London, S.W.12, to whom subscriptions (2s. 6d. to December 31st, 1930) may be paid. Any further particulars from the hon. secretary, Mr. L. S. Richardson, 70, Preston Road, Wembley Park, Middlesex.

TRADE PUBLICATIONS.

THE WHOLESALE FITTINGS CO., LTD., 23-37, Commercial Street, London, E.1, has published list No. 238 dealing with electrical glassware.

DANIEL DONCASTER AND SONS, LTD., associated with the United Steel Companies, Ltd., have sent us booklet No. DD106 relative to forgings.



[Reproduced from "The Philips Announcer"

Just plug it in . . . (P)

A new mailing card relative to "Tungstone" batteries has been received from the TUNGSTONE ACCUMULATOR CO., LTD., Salisbury Square, London, E.C.4.

The wholesale firm of R. CADISH AND SONS, 5-6, Red Lion Square, London, W.1, have issued a special leaflet describing the "Dunham'" portable wireless receiver.

We have received from the UNITED STEEL COMPANIES, LTD., 17, Westbourne Road, Sheffield, a special brochure, No. U.S.C. 101, dealing with their products.

J. H. TUCKER AND CO., LTD., Kings Road, Tyseley, Birmingham, have published folder F1 by way of introducing a new range of teak-case fuseboards, 15A 250 V—10 A 500 V.

The DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex, has issued list No. 129 relative to "A.M. Junior" temperature recorders; and list No. 96 dealing with boiler water level controllers.

The ORMOND ENGINEERING CO., LTD., Ormond House, Rosebery Avenue, London, E.C.1, has published a new catalogue of the company's range of radio products. The issue is well illustrated and contains very complete descriptions.

Two new publications of the MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, London, W.C.2, are leaflet No. 1110 dealing with a new type S.P.2 10w portable short-wave set and leaflet No. 1104 describing type R.G. 24 short-wave receiver.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C.4, has issued leaflet No. 1 015 dealing with three-phase self-acting reversible motor startors, for squirrel cage motors, and leaflet No. 110 describing multiple finger self-acting starting rheostats for small d.c. motors.

We have received from ECK AND BROOK, LTD., 4/12, Palmer Street, London, S.W.1, a copy of publication H.B. 406/a. This is a newly issued brochure dealing with the company's grip current tester and besides giving a comprehensive description of the instrument contains a number of appreciations from well-known engineers.

ELECTRICITY SUPPLY.

New Generator for Ashford—Lincolnshire Supply Scheme—Barnsley's Halfpenny Off-Peak Supply—First Portion of Bristol Station Nearing Completion—Abolition of Torquay's Service Charge—New Plant and Mains at Wimbledon.

PORTLAND Electricity Committee has decided to lay cables at a cost of £1 492.

Sanction to a loan of £3 308 for mains extensions has been received by East Ham T.C.

Sheffield Electricity Committee has authorised mains extensions at a cost of £9 075.

Ashford (Kent) U.D.C. has received sanction to instal at the electricity works another 800 kW set.

Hastings electricity department is to extend mains, at a cost of £1 100, for the supply of electricity to Sedlescombe.

The Borough Surveyor of Paignton is to submit an estimate of the cost of providing decorative coloured lighting on the sea front.

Coventry Electricity Committee seeks sanction to borrow £110 519 for the outstanding balance of the cost of the Longford generating station.

Hackney (London) Electricity Committee has arranged to lease a site adjoining the power station to the Central Electricity Board for a grid sub-station.

An estimate from the Irish Free State Electricity Supply Board for the lighting of Carrick-on-Suir town with 50 lamps at £171 a year, has been referred by the U.D.C. to a committee.

With regard to the proposal to extend the area of supply, Kendal T.C. has decided to restrict the application to the Commissioners to an area covered by a circle of three miles radius from the town hall.

Colchester Electricity Committee has authorised extensions of mains at Stanway and Chitts Hill, at a cost of £820.—The Committee has decided to seek consent to the erection of the line to West Mersea above ground.

Liverpool Electric Power and Lighting Committee has had under consideration a proposal to construct a cable tunnel between Clarence Dock power station and Pumpfields sub-station. Estimates are being prepared.

Spilsby R.D.C. has decided to support the application of Mr. Borlase Matthews for an electricity scheme for the district. Mr. Matthews has undertaken to have electricity available for Spilsby and Humbleby within two years.

Darwen Corporation is making application to the Electricity Commissioners for permission to change the system of supply from d.c. to a.c. and for sanction to borrow £22 000 for that purpose and the extension and renewal of mains.

An application is to be made by Birkenhead T.C. to the Electricity Commissioners for sanction to borrow £10 000, the cost of substituting an a.c. for the present d.c. supply in Grange Road, Cavendish Drive and Bebington Road.

Barnsley Electricity Committee recommends that a flat rate tariff of ½d. per kWh be offered to consumers employing electricity for certain purposes, including commercial baking ovens and central heating during off-peak load periods.

Hertfordshire County Council is about to approach the North Metropolitan Electric Power Supply Co. and the Chesham Electric Light and Power Co. in regard to a supply of electricity by either of them in the parish of Markyate.

Newport (Isle of Wight) Lighting Committee has received from the Isle of Wight Electric Light and Power Co. an application for consent to the change of system from d.c. to a.c. The Committee recommends that consent be given.

Chichester Corporation has instructed the Electrical Engineer to place before the Commissioners a scheme for extending and developing the electricity undertaking at a cost not to exceed £70 000. An unemployment grant is to be applied for.

Bristol Electricity Committee reports that the first instalment of Portishead generating station is nearing completion, and it is now expedient to borrow £210 000 to cover the outstanding portion of the total expenditure in connection therewith.

Balrothery R.D.C. has received a tender from the Irish Free State Electricity Supply Board for the lighting of the town of Rush with 35 200 W lamps from April 1st, 1930, to March 31st, 1931, at a cost of £105. Consideration of the offer has been postponed.

Manchester Lighting Committee recommended, at last week's City Council meeting, that improved gas lighting be installed in Queen's Road, from Cheetham Hill Road to Oldham Road. The Council, however, decided to adopt electric lighting in the thoroughfare referred to.

Torquay Electricity Committee seeks sanction to borrow £2 010 for the erection of an overhead line from Buckfastleigh to Ashburton.—In future no charge is to be made for services to connect new consumers' premises to the Corporation's mains unless the length of such services exceeds 30 ft.

It is estimated that the cost of the main switchboard and switchgear required at the Burton-on-Trent electricity works in connection with the Central England electricity scheme will be £30 346, including £5 821 for rearrangement of existing board; £19 625 for new switchgear and house, and £4 900 for transformers. The Electricity Committee has authorised the carrying out of the work.

Marking the opening of the 1930 Mardi Gras celebration in New Orleans next month will be the formal inauguration of the South's greatest "White Way" with the light from the city's new ornamental lighting system. More than 100 standards, of Louis XVI design, and each equipped with three 1 000 W lighting units, will be erected at 100-ft. intervals down the parkway of Canal Street. Compared as to brilliance, the New Orleans system will rank third among cities of the country.

Col. Gordon Tucker held a Ministry of Transport inquiry on February 6th, at Rugby, relative to the application of the Leicestershire and Warwickshire Electric Power Co. for compulsory wayleaves to erect poles to carry an overhead line at Lower Hillmorton on land belonging to Lieut.-Col. J. T. Bucknill, who wrote saying that the poles would ruin his land agriculturally. Mr. Wallace, for the company, said the cost of the proposed line would be £1 935, while the revenue from the scheme for many years would not exceed £250 a year.

Marylebone (London) B.C. is advised by the Electricity Committee to enter into an agreement with the Regent Estate Co., Ltd., for the installation of rising mains for the 53 flats comprising the property known as Manor House, Marylebone Road, at a total estimated cost of £1 166.—The Committee also recommends that the Council agree to provide the necessary rising mains and sub-mains in connection with the first two blocks of tenements on the London County Council's Carlisle Street housing estate at a cost of £290 per block.

Weymouth General Purposes Committee reports that it has been negotiating with a view to obtaining a firm price for the supply of electricity for the pumping stations. The Committee has suggested to the electricity department that the price might be reduced, and fixed for a definite period, subject to the fluctuations usually provided for in agreements for the supply of electrical energy. The Electricity Committee is unable to agree to the suggestions. It has been decided that the pumping stations be reorganised on an electrical basis.

Wimbledon Electricity Committee recommends the provision of five new sub-stations and two new transformer kiosks, the enlargement of 18 existing sub-stations, and the equipment of several sub-stations on consumers' premises, at an estimated total cost of £19 000. The Committee also recommends the laying of supplemental cables and the replacement of one of the existing h.t. mains between Raynes Park and Malden sub-stations, and a similar main from the electricity works to Raynes Park sub-station, by cables of a larger section, at a cost of £22 196. Sanction is sought to purchase an additional 7 500 kW two-phase turbo-alternator, with switchgear and auxiliaries, and to the raising of a loan of £33 000 for the purpose.

SOUTH-EAST ENGLAND MAP.

The Electricity Commissioners have forwarded, for our information, a copy of a map which they have had prepared, and are publishing, showing the areasof supply of authorised undertakers in South-East England as at January 31st, 1930. If there is a sufficient demand for maps of this character, the Commissioners will undertake the preparation and issue of similar maps for other sections of the country. Copies are obtainable from Edward Stanford, Ltd., 12-14, Long Acre, London, W.C.2, price 10s. each, package and postage 9d. extra.

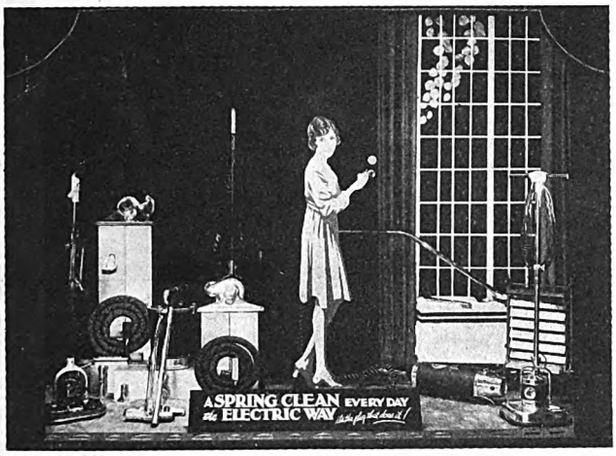
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

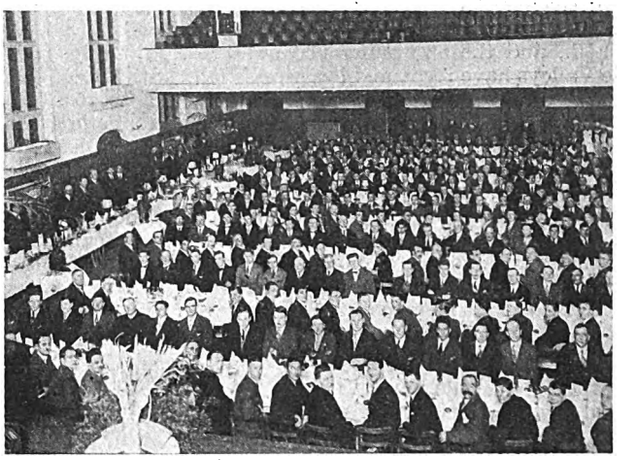
The Earl of Clarendon, chairman of the British Broadcasting Corporation, who has resigned in order to accept the appointment of Governor-General of South Africa.

A general view of the control room at the Leicester generating station, the extensions of which were brought into service on Wednesday. A description of the new plant, together with further pictures of the station appear on pages 221–223.

Sir Andrew Duncan, chairman of the Central Electricity Board, who has been appointed to the Economic Council inquiring into general economic conditions.



The March window display in connection with the E.D.A. selling campaign is devoted to the subject of spring cleaning. The interior is first covered with pale green crêpe paper and the home window effect is obtained by setting aside a portion of the background to be used as an imitation window. This is then covered with pale blue crêpe paper, and the window panes are obtained by making use of strips or tubes of white crêpe paper.



A company of over 400 employees of the Shropshire, Worcestershire and Staffordshire Electric Power Co. were entertained at their fifth annual dinner by the company at Dudley Town Hall on February 8th. Representatives were present from all parts of the company's area, which now embraces about 2 500 square miles. Mr. T. E. Boothby presided, supported by Mr. J. T. H. Legge, the Mayor of Dudley and the Chief Constable.

During the latter half of last week, from February 12th to the 15th, a remarkable effort was made to promote the better electrical education of women engaged in supply authority and contractors' showrooms in this country. The "course" was provided by the E.D.A., E.L.M.A. and the Electrical Association for Women, working in close alliance, and no fewer than 130 women from all parts of the country signed on for three days' intensive instruction. The lectures were staged in E.L.M.A.'s Lighting Bureau in Savoy Street, London, and attention was devoted during the morning and afternoon sessions on Wednesday, Thursday and Friday to the whole range of electrical activities—lighting, installation work, heating, cooking, and salesmanship. On Friday evening more than one hundred of the students assembled for an informal dinner at the Coventry Restaurant, with Lt.-Col. Vignoles in the chair. On the following morning (Saturday) visits were arranged to the new Polytechnic building and to the showrooms of the Westminster Electric Supply Corporation and the Battersea electricity department.

COMPANY NEWS.

Cables and Wireless Stocks Steady—Enfield Cables Shares Improve—Underground Companies' Dividends—Yorkshire Electric Power Co.'s Meeting—New Companies.

CABLES and Wireless "A" ordinary stock has steadied a little after its recent fluctuation, and this week's quotation of 64½ compares with 63 a week ago. The "B" and preference stocks of the company are unchanged at 30½ and 96 respectively. Radio Corporation of America shares have continued to be in demand, and the price has risen from 43¼ to 46; while American Telephone and Telegraph capital stock has not only maintained the higher price level reacted on the announcement recently regarding the proposed agreement between the two companies, but has during the past week advanced a further five points to 240. Hydro-Electric Securities have recovered from 42¼ to 43⅝, and International Telephone and Telegraph stock from 70 to 72½ dollars. International Holdings are rather easier at 5.

In the manufacturing section the feature has been the further strength of Enfield Cable Works ordinary shares, which show an advance on the week from 93s. 9d. to 96s. 3d., after being higher. General Electrics have put on 1s. 3d. to 47s. 6d., and British Thomson-Houston debentures are a point better at 104½. Consolidated Signal ordinary shares have dropped five shillings, from 42s. 6d. to 37s. 6d. Ever-Ready ordinary shares have eased 3d. to 17s. 3d.

Quite a number of changes are recorded among electricity supply shares. The ordinary shares of the Fife Tramway, Light and Power Company have jumped up from 12s. 6d. to 14s. 4½d., and the 6% preference from 16s. 3d. to 17s. 6d. Clyde Valleys have recovered last week's fall. St. James' and Pall Mall shares are up a shilling, from 25s. 6d. to 26s. 6d., and Electrical Distribution of Yorkshire shares have been advanced to 35s. Midland Corporation for Power Distribution shares have fallen 1s. 3d. to 32s. 6d., and Scottish Power shares from 30s. to 29s. Tokyo bonds are half a point higher; Victoria Falls shares are slightly down at 58s. 9d.

In the transportation section, London United Tramways debentures are a couple of points higher at 52½, and Rio de Janeiro 1 at 86⅜. Central London ordinary stock has risen 2 points, but Metropolitan ordinary is a point down.

Directors' Reports, etc.

CONSOLIDATED SIGNAL CO., LTD.—Fin. div. 12%, less tax, is announced.

BROMPTON AND KENSINGTON ELECTRICITY SUPPLY CO., LTD.—Fin. div. 10·477d. p. sh., less tax, is announced, makg. standard div. for year of 8·532%.

WESTERN ELECTRIC CO. (U.S.A.).—The company has offered shhldrs. the right to subscribe for 700 000 shs. of common stk., at 40, in the ratio of one new sh. for every seven held.

CHARING CROSS ELECTRICITY SUPPLY CO., LTD.—Fin. div. of 10 1/16d. p. sh., less tax, makg. 19 3/16d. (same as last year), being standard div. on West End undertakgs. of the company, is announced.

METROPOLITAN RAILWAY CO.—The British Shareholders' Trust, Ltd., has, during the present week, offered for sale £2 000 000 of 3½ % A deb. stk. at £65½, to yield, after 1st int. paymt, £5 6s. 10d. %.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Fin. div. of 3% (3s. p. sh.) on 6% £5 pref. shs., makg. 6% for year 1929, less tax, and fin. div. of 5% (1s. p. sh.) on £1 ord. shs., makg. 9% for year 1929, less tax, will be payable on March 12.

INTERNATIONAL MARINE RADIO CO.—The British directors of the International Marine Radio Co., which was recently formed by the International Telephone and Telegraph Co., are Messrs. G. H. Nash, F. J. E. Brake, Alex. Davidson and R. L. Nicholson,

ALUMINIUM CORPORATION, LTD.—At a mtg last Friday, the 1st deb. hldrs' assented to the release of rights of the deb. hldrs. agst the company, conditionally on a scheme of reorganisation of cap. becoming operative. The deb. hldrs. are to receive 60% in cash, and for the blce. they will receive a new 1st deb. carrying a higher rate of int. Whereas the present debs. are redeemable at a premium of 5%, the premium of 5% on the new debs. applies to only 40% of the principal.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Net rev. for 1929, £400 225, agst £374 621 ; plus blce. brt. in £28 202. Int., £33 983 ; to res. for 5% mtges. £2 000; redemptn. fund for 5½% deb. stk.; £8 750 ; to res. £126 548. Div. on 6% cum. pref. shs. for year, £69 000 ; div. on ord. shs., 10% for year, of wh. 4% has already been paid. Fwd. £28 146. Electricity sold was 199 700 000 kWh, agst. 164 300 000. A specl. mtg. will be held on Feb. 25, following the ord. gen. mtg., to consider resolutions to create and issue 250 000 6% cum. pref. shs. of £1 each and £750 000 further 5½% deb. stk.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Income for 1929, £650 192, blce. to net rev. acct., £206 739 ; net rev. £161 292 ; fin. ord. div., 13·12d. p. sh., makg. standard div. of 1s. 9·12d. p. sh. To special res. (ord. shhldrs.' proportn. of consumers' benefit), £29 166. Fwd., £25 574, agst. £29 022. Consumers' benefit for year amtd. to £174 996. Directors have inaugurated an employees' co-partnership scheme, and amt. to be distributed for 1929 is £9 803. Total number of meters connected at Dec. 31, 1929, amtd. to 33 423, agst. 31 294. Electy. sold during year was 71 436 473 kWh, increase 11 582 064.

SOUTHERN RAILWAY CO.—Gross receipts for 1929, £26 507 018, decrease £9 877 ; pft. £6 547 965, increase £153 553. Div. on pfd. 5%, and on defd. 2½%, agst. 2%. Surplus for year £26 168, agst. £30 052 ; fwd. £161 886, agst. £135 718. Orders have been given for electrificatn. of lines from Hounslow and Twickenham to Windsor, Dartford to Gravesend, and West Croydon to Wimbledon, and it is anticipated that these lines will be operated electrically during the current year. In accord with the remissn. of railway passenger duty, company will expend £2 042 560, and this will be applied in electrifying line to Reigate, Brighton and Worthing.

FIFE TRAMWAY, LIGHT AND POWER CO., LTD.—Net rev. for 1929, £99 771, agst. £80 198. Int. charges £28 117, agst. £26 635 ; to debenture sinkg. fund £4 449, agst. £4 968 ; to res. £7 767, agst. £8 000. Ord. div., 4% (same) ; fwd. £25 286, agst. £5 848. Pfts. of undertakgs. owned and operated by company, £122 218, agst. £127 004. Power and lightg. business was sold as at July 1, 1929. Accts. include rev. of power and lightg. properties for half year to June 30, 1929. Outstandg. 5% deb. stk. was repaid on Nov. 11, and repaymt. of 5½% regd. notes will be made on March 31. Arrangemts. have been made for further protectg. tramway undertakgs.

ELECTRICAL AND INDUSTRIAL INVESTMENT CO., LTD.—Pft. for 1929, £23 797, agst. £22 148 ; pref. div. (6%) absorbed £6 000 (same), div. on pfd. (7%), £7 000, agst. 6%, or £5 400. Fwd. £3 797, agst. £3 748, makg. undivided pfts. acct., £21 737. The unissued 10 000 dfd. shs. of £1 each were subscribed at par ; dfd. ord. shs. were converted into dfd. ord. stk. Credit blce. resultg. from changes of investmts. has been placed to res., making that acct. £71 363. Investmts. are stated in blce. sheet at or under cost (£628 786). They consist of debs., deb. stks., etc., 19·92% (agst. 22·15%) ; pref. shs. and stks., etc., 16·72% (agst. 17·84%) ; ord. shs. and stks., etc., 52·92% (agst. 53·46%) ; Governmt. and municipal loans, 7·57% (agst. 6·55%) ; syndicates and loans, 2·87% (agst. nil). Of total investmts., electric power and tractn. (combined undertakings) acct. for 2·82%, tramways and omnibuses 15·97%, electric lighting and power 1·69%, commercial and industrial 24·54%, railways 14·24%, financial trusts 9·62%, and Government 7·21%.

UNDERGROUND GROUP.—The following are abstracts of the accounts of the Underground Electric Railways Co. of London, and companies controlled by the Underground Group. —*Underground Electric Railways Co. of London, Ltd.*—Full half year's int. to Dec. 31, 1929, on 6% 1st cum. income deb. stk. and on 6 % income bonds of 1948, makg. in each case a full rate for year, and fin. div. of 5% on ord. shs., makg. 8% for year, agst. 7% (payable on March 7) ; Fwd. £265 950, agst. £262 504. *Metropolitan District Railway Co.*—Fin. div. on ord. stk. of 2½%, makg. 5% for year (same as last year) ; to res., £117 000, increase £6 575 ; fwd. £48 108, agst. £44 768. *London Electric Railway Co.*—Fin. div. on consol. ord. stk., 2½%, makg. 5% (same) ; to res. £186 332, increase £16 383 ; fwd. £186 784, agst. £177 152. *City and South London Railway Co.*—Fin. div. on consol. ord. stk., 2½%, makg. 5% (same) ; to res., £30 000, agst. £25 000 ; fwd. £37 708, agst. £36 179. *Central London Railway Co.*—Fin. div. on undivided ord. stk., 2½%, makg. 5% (same) ; fin. div. on pfd. ord., 2%, makg. 4% (same) and div. for year on dfd. ord. stk. 6% (same) ; to res., £33 000, decrease £7 134 ; fwd. £108 151, agst. £105 053. *Associated Equipment Co., Ltd.*—Fin. div. on ord., 4%, tax free, makg. 8% (same) ; fwd. £207 843, agst. £201 261. In all cases except the ord. div. of the Underground Co., the int. and divs. will be paid on March 1.

Company Meetings.

GLARE-VISOR PARENT, LTD.—At a recent special meeting resolutions for the amalgamation of the company with the Sphinx Electric Co. were adopted. The proposals were that Glare-Visor be wound up voluntarily, that Sphinx Electric take over the undertaking, assets and liabilities of the company, and that shareholders be entitled for every share now held to subscribe for two ordinary shares in the amalgamated company of 1s., credited as 6d. paid up, leaving a liability of 6d. per share. Sphinx Electric will increase its present capital by the creation of the necessary number of ordinary shares of 1s. each.

WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD.—Lord Southborough, presiding at meeting on Monday said the net profit for the year ended September, 1929, was £102 292. The average for the four preceding years was £101 144. Their rectifier business continued to increase in volume. This year their output had been about three times the amount of last year. He hoped that the apparatus was familiar to all who used wireless sets, and, if it were not, they hoped shareholders would examine the invention and give their support to the company rather than to the manufacturers of rectifying valves. For the first four months of the present financial year both orders and sales had been high, and he was advised that these four months would show highly satisfactory trading profit figures. Prospects for the remainder of the current financial year were good in the sense that a very large volume of signalling work was to be let by the British railways during the next eight months, and they hoped to obtain their proportion of it. The report was adopted and the dividend of 8%, less tax, approved.

POWER SECURITIES CORPORATION, LTD.—Mr. George Balfour, M.P., presiding at the meeting last Friday, said he did not think that any responsible person could view the future of the country with anything but grave misgivings. They could only hope that the serious situation with which the country was faced would stimulate interest in public affairs, resulting in a diminution of Government interference, which, in his view, was the chief cause of unemployment and other troubles. The large works at Lochaber had been successfully carried out, involving the removal of a million tons of rock in the 15-mile tunnel, the construction of many shafts, dams, and intakes, finished with the blasting out of the end of the tunnel into Loch Treig 100 ft. under water. The profits shown in the corporation's account would have been substan-

Digitized by Google

tially greater during the last few years if they had not been under the necessity of making provision in the accounts of Balfour, Beatty, and Co. against any possible loss on these works instead of bringing into their account substantial profits from this source. The work on the Grampian scheme had gone on without a hitch, and was well up to time. They had every reason to believe that the hydro-electric power works, equipped with 32 000 kW plant, would be in operation in the autumn and the supply available over a very wide area. They solidly established the Spanish enterprise to which he referred last year and pulled it out of its difficulties and arranged a sale, for their friends for whom they were acting, to the most important Spanish interests, the transaction giving satisfaction to all parties. At present they had on hand works involving finance and engineering on a thoroughly satisfactory basis amounting to upwards of £2 000 000 at home and abroad, including South America, East Africa, India, Palestine, Italy, etc. Only a few days ago they signed the contract with the Madras Government for the handling of a large hydro-electric plant and the construction of over 100 miles of extra high tension transmission lines. Investments at or under cost amounted to £550 082, an increase of about £50 000 over last year, this amount being largely represented by additional shares which they had taken up in electric supply companies. Investments in shares of subsidiary companies stood at £377 529, being the cost of their investments in Balfour, Beatty, and Co., Ltd., and the Hydro-Electric Development Co., Ltd. The reserve account had been increased to £150 000. The income for the year was £112 393, a decrease of £11 000. The balance, after provision for expenses, taxation and directors' fees, was £79 424, a reduction in the net profit of £6 000. The report was adopted, and the dividend of 7%, less tax, on the ordinary shares was approved.

YORKSHIRE ELECTRIC POWER CO.

Increased Revenue—Further Growth of Bulk Supplies—The Ferrybridge Selected Station.

THE shareholders' meeting of the Yorkshire Electric Power Co. was held in Leeds on Tuesday, February 18th.

The Chairman said: The revenue has grown from £605 858 to £675 309, an increase of over £70 000.

The company is supplying a number of local authorities and Water Boards with electricity for water pumping purposes, and a supply of electricity is available throughout the whole of the company's area for these purposes. In the revenue account £20 000 has been reserved for contingencies; this will be added to the £100 000 set aside in past years. The company's works have been fully maintained out of revenue, and so far it has not been necessary to make calls upon this fund.

Bulk supplies again show an increase; the company is now giving a supply in bulk to 8 boroughs, 93 urban districts and 20 rural districts. During the year the company has been authorised to supply electricity in an area of 66 square miles in the county of Derby, and the company is already meeting substantial demands in the new district. The company is proceeding with the application for powers to supply in the county of Lincoln and in the East Riding of Yorkshire.

The Commissioners have now intimated their intention to grant powers to the company to supply for all purposes, and the details are under discussion. It was reported at the last meeting that the Central Electricity Board had issued their Mid-East England Electricity Scheme. The area to which the scheme relates contains 40 public generating stations, of which 18 have been determined to be selected stations. The company's Ferrybridge power station is the most efficient of those 18 stations in the area under the Mid-East England Scheme which the Board have determined to be "selected" stations and is one of the four most efficient stations in the country. It is satisfactory to note that all the stations of the company have been selected, and that two of them are included in the five which are intended to deal with the base load output over an area of above 7 500 square miles.

It is proposed to make an early extension of the generating plant at Thornhill by the installation of a 27 500 kW turbo-alternator to meet the growing demands.

The proposals of the board include the addition of £100 000 to the general reserve fund, increasing that fund to £575 000. This amount, with the sum carried forward after payment of dividend and the balances standing to the credit of the share premium account and plant renewals fund, amount to a total of £804 155, which is available for renewals and other purposes.

The report and accounts were adopted.

NEW COMPANIES.

HUPP, LTD.—Cap., £1 000. Wireless, electrical and general engineers, etc. Reg. Office: 112, Fenchurch Street, London, E.C.

EDWARDS AND MARSHALL, LTD.—Cap., £1 500. Electrical and general engineers, etc. Reg. Office: 30½, Winchcombe Street, Cheltenham.

IRISH A. E. G. ELECTRIC CO., LTD.—Cap., £100. Manufacturing and consulting electrical engineers, etc. A subscriber: J. McBreen, 88, Grosvenor Square, Rathmines, Dublin.

E. L. MAIDEN, LTD.—Cap., £1 000. Heating and ventilating engineers, electrical engineers, etc. Reg. Office: 36, Bolsover Street, Great Portland Street, London, W.1.

HOME UTILITIES (MIDLANDS) CO., LTD.—Cap., £500. Dealers in electrical or non-electrical cookers, refrigerators, vacuum cleaners, etc. Reg. Office: 19, Gordon House, Carrington Street, Nottingham.

MACBRIDES, LTD.—Cap., £500. Manufacturers of, agents for, and dealers in machinery and plant, including electrical generators, engines and plant, etc. Reg. Office: Southern Railway Sidings, Hampton, Middlesex.

R. C. SEAL AND CO., LTD.—Cap., £2 000. To acquire business carried on by T. A. R. Terrell as "R. C. Seal," at 18, Dartmouth Street, Westminster, S.W.1, to carry on business of manufacturers of electrical appliances, etc.

INDUSTRIAL SCIENTISTS, CONSULTANTS AND FINANCE CORPORATION, LTD.—Industrial scientists, scientific advisers, electrical and general engineers, etc. A director: G. Martin, Woodleigh, Barrington Road, Wembley, London, N. (both permanent, subject to each holding 50 shares).

FREDERICK SQUIRE, LTD.—Cap., £1 000. Manufacturers of and dealers in wireless apparatus, apparatus for the transmission and reception of pictures by wireless, amplifiers, generators, accumulators and batteries, electrical engineers, etc. Reg. Office: King's Works, Leswin Place, Stoke Newington, London, N.16.

BROADCAST RELAY SERVICE (CLACTON), LTD.—Cap., £7 000. To acquire business established by Broadcast Relay Service, Ltd., at Clacton-on-Sea, and Braintree, to construct and maintain wireless signal stations for the reception or distribution of wireless or radio signals, etc. Reg. Office: 93, Hayes Road, Clacton-on-Sea.

Receiverships.

ACME ELECTRIC WIRE AND CABLE CO., LTD.—S. I. Wallis, of King John's Chambers, Bridlesmith Gate, Nottingham, was appointed receiver on February 3rd, 1930, under powers contained in debenture dated August 18th, 1925.

TANGENT TOOL ENGINEERING CO., LTD. F. W. Eacott, of 68, Filton Road, Horfield, Bristol, was appointed receiver on February 5th, 1930, under powers contained in debenture dated October 2nd, 1925.

T.V.E. (TRIPLEX-BLADE VENTILATING ENGINEERING) CO., LTD. —E. L. Lee, of 25, Victoria Street, Westminster, was appointed receiver on February 1st, 1930, under powers contained in instrument dated September 24th, 1928, and on January 25th, 1930, under powers contained in instruments dated December 3rd, 1928, and January 29th, 1929.

Mortgages.

[NOTE.—***The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *— followed by the date of the Summary, but such total may have been reduced.***]

BOWERS AND BARR, LTD., Great Yarmouth, electricians.—Registered February 5th, £350 mortgage, to Mrs. S. A. R. Barr, 11, Trafalgar Road, Great Yarmouth; charged on 9, Baker Street, Gorleston-on-Sea. *£1 138 bank overdraft, £300 mortgage. December 31st, 1929.

PERAK RIVER HYDRO-ELECTRIC POWER CO., LTD., London, S.W. —Registered February 1st, £850 000 charge, to Secretary of the Government of F.M.S. Kuala Lumpur; charged on a concession etc. lands and property in the F.M.S. or elsewhere present and future, etc. (subject to 1st Trust Deed and in priority to 2nd Trust Deed). *£2 850 000. January 14th, 1930.

RIDOUT AND RATCLIFF, LTD., London, W., electrical contractors. —Registered February 4th, £1 000 debenture, to Branch Nominees, Ltd., 15, Bishopsgate, E.C.; charged on land in London, also general charge. *Nil. October 31st, 1929.

London Gazette, etc.

Winding-up Petition.

HALCYON WIRELESS CO., LTD. A creditor's petition for winding-up has been presented and is to be heard at the Royal Courts of Justice, Strand, London, on Monday, March 3rd.

Companies Winding-up Voluntarily.

CLEETHORPES RADIO SUPPLY, LTD. By reason of its liabilities, February 10th. A. J. Weaver, corporate accountant, 77, Victoria Street, Grimsby, appointed as liquidator.

STANDARD ELECTRIC CO., LTD. Meeting of creditors, 190, West George Street, Glasgow, Tuesday, March 11th, at 11.15 a.m.

Bankruptcy Information.

CANE, John Alwyn, CANE, Thomas Phillips, CANE, Douglas Raymond, consulting and electrical engineers, trading as CANE BROTHERS, Sturry, Kent. Receiving order, January 28th. Creditor's petition.

EDGHILL, Harry George, 13, Wembley Hill Road, Wembley, Middlesex, electrical and wireless engineer. Receiving order, February 10th. Debtor's petition. First meeting, February 26th, 12 noon, 29, Russell Square, London, W.C.1. Public examination, March 12th, 10.30 a.m., Court House, St. Albans.

Bankruptcy Proceedings.

COHEN, George, electrical engineer, 49, Newman Street, London, W. The affairs of this debtor came before Mr. Registrar Warmington in the London Bankruptcy Court on Wednesday on the hearing of his application for an order of discharge. The Official Receiver reported that the adjudication in bankruptcy took place on November 20th, 1928. According to the report of the trustee in bankruptcy the proofs of debt and probable claims together amounted to £4 075 and the assets which were valued by the debtor at £550 had realised £344. The debtor originally began business as an electrical engineer in 1901, but in 1910 was compelled to compound with his creditors, having incurred losses through bad debts. Afterwards he carried on business in Golders Green Road. On his demobilisation from the Army in April, 1919, he resumed business in the City, and he had since traded either alone or in partnership. The Official Receiver opposed the application on several statutory grounds and alleged that the debtor had failed to account satisfactorily for a deficiency of his assets; and that he had been guilty of misconduct under the Bankruptcy Act in transferring his assets in April, 1928, to an alleged partnership with his son, aged 17 years, and in appealing against the receiving order and thereby delaying the proceedings for nearly three months, whereby he was enabled to dispose of a large quantity of stock purporting to be partnership property after the receiving order, thereby defeating and delaying his creditors and causing them substantial losses estimated by himself at £901; and further that in making payments of £150 and £50 to two persons after the date of the receiving order for alleged loans he had also been guilty of misconduct. His Honour suspended the discharge for five years.

LANCELOT, E., Old Trinity House, 5, Water Lane, London, E.C. The debtor, who formerly carried on business as a dealer in electrical batteries, attended before Mr. Registrar Mellor in the London Bankruptcy Court last week for his public examination. It appeared that in January, 1926, he began business, with a capital of about £65, as a dealer in electrical batteries. Shortly afterwards, with a view to developing the business, he entered into a verbal arrangement with a certain firm, to whom, in consideration of financial assistance, he agreed to pay half of his profits. In or about June, 1926, the debtor took an office at 145, Fenchurch Street, City, and early in the following year the firm just mentioned was unable to provide further money, and, as a result, he was forced to cease trading. In August last judgment was obtained against him by default in respect of a disputed claim for moneys advanced under the arrangement, and the proceedings in bankruptcy ensued. The debtor attributed his insolvency to his liability under the judgment. The examination was concluded.

WYLIE, Ewart James Hutchings, 1 367, London Road, Norbury, Surrey, lately wireless set manufacturer. The receiving order herein was made on January 13th on the debtor's own petition. According to the statement of affairs there are liabilities amounting to £742, against assets of £14, a deficiency of £728. Debtor attributed his failure to lack of capital and bad trade. The debtor states that in May, 1928, he and another commenced business in partnership as wireless set manufacturers, at 21, Lonsdale Road, Kilburn, his partner providing £100 as capital. In June, 1928, they supplied a quantity of 3-valve wireless sets to a customer who afterwards returned them on the grounds that they were not up to specification. Costly experiments were afterwards made to produce a set to the required standard but without success, and the debtor estimates they made a loss of £300 over this order. The debtor also states that in April, 1929 the partnership was dissolved, his partner taking over the assets, about £450, and agreeing to discharge the liabilities of £750, but the debtor has no knowledge of what became of the assets or what debts were paid. Since June, 1923, the debtor has been employed as manager to a firm of wireless set manufacturers. The debtor filed his petition in consequence of a judgment being obtained against him by one of the late partnership creditors. The debtor further states that his partner closed the business in August, 1929. The books stated to have been kept by the partnership firm consisted of bought and sold ledgers, petty cash book, and delivery book, and these were taken over by the late partner. Debtor admits that he became aware of his position in April last. As a result of the first meeting of creditors the matter remains in the hands of the Official Receiver as trustee. The following are creditors: Hughes and Co., T. A., Ltd., £580; London Radio Manufacturing Co., Ltd., £80; Six Sixty Radio Co., £81.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

320 881 C. H. Verity. Means for the synchronisation of broadcast wireless sounds and kinematograph films. (23/7/28.)
321 138 J. L. Baird and Television, Ltd. Television apparatus and the like. (31/5/28.)
309 539 Electrical Research Products, Inc. Manufacture of chromium articles. (12/4/28.)
320 959 Soc. Chimique de la Seine and V. Szidon. Methods of electrolytically depositing chromium. (28/7/28.)
320 882 Brookhirst Switchgear, Ltd., and J. A. Hirst. Method of and apparatus for starting and controlling electric motors. (16/6/28.)
320 864 W. E. Beatty (Bell Telephone Laboratories, Inc.). Driving-shafts. (20/7/28.)
320 961 W. E. Beatty (Bell Telephone Laboratories, Inc.). Television and like systems. (26/1/28.)
320 866 E. Y. Robinson and Associated Electrical Industries, Ltd., Vacuum electric tube devices. (19/6/28.)
321 154 H. D. Black. Indicator-boards of totalisators. (26/4/28.)
289 443 A. Blondel. System of distant electric control by synchronized distributers. (27/4/27.)
321 194 J. Johnston. Television systems. (3/5/28.)
321 196 J. L. Baird and Television, Ltd. Glow-discharge lamps and the like. (4/5/28.)
291 384 British Thomson-Houston Co., Ltd. Remote electric control systems. (31/5/27.)
320 979 H. H. Berry. Day and night signs. (5/3/29.)
321 144 P. D. Tyers. Electrical reproduction of gramophone and like sound records. (26/6/28.)
321 147 King's Patent Agency, Ltd. (W. B. Phillips). Switchgear for operating systems of electric lighting in railway carriages and other vehicles. (29/6/28.)
321 197 M-O Valve Co., Ltd., and B. S. Gossling. Vacuum tube electric devices. (2/7/28.)
293 323 Allgemeine Elektricitats ges. Thermionic valves and the like. (2/7/27.)
321 151 P. W. Willans. Electromechanical apparatus, such as sound reproducers or tramsmitters, oscillographs, and the like. (25/7/28.)
321 156 A. V. Tomlinson (McKenzie and Holland (Australia) Proprietary, Ltd.). Electrical point and lock detectors for railways. (26/7/28.)
321 165 Simplex Conduits, Ltd., and H. F. McLoughlin. Metallic boxes or cases such as used for the mounting of electric switches or other electrical accessories. (30/7/28.)
321 206 D. Ripley. Electric protective systems and apparatus for use therewith. (31/7/28.)
321 184 J. A. Crabtree and B. G. Harrison. Switch and other cover plates such as used in conjunction with flush-mounted and surface-mounted electrical accessories. (1/8/28.)
295 714 A. C. Spark Plug Co. Ammeter. (19/8/27.)
321 216 Automatic Telephone Manufacturing Co., Ltd., G. A. Burns, H. S. Deyes. Telephone systems. (2/8/28.)
306 520 Akt.-Ges. Brown, Boveri, et Cie. Mercury-vapour rectifiers. (23/2/28.)
304 644 Westinghouse Brake and Saxby Signal Co., Ltd. Light-sensitive apparatus. (23/1/28.)
301 056 Westinghouse Brake and Saxby Signal Co., Ltd. Light signals. (25/11/27.)
295 685 Siemens-Schuckertwerke Akt.-Ges. Electric discharge devices for use as relays. (17/8/27.)
321 223 W. T. Henley's Telegraph Works Co., Ltd., A. W. C. McArthur, and H. C. Hoban. Jointing of multi-core electric cables. (3/8/28.)
321 226 P. E. J. Eggers. Devices for interrupting and for closing electric circuits employed in connection with internal-combustion motors and other electric circuits. (4/8/28.)
295 389 Siemens-Schuckertwerke Akt.-Ges. Electrical maximum-demand indicating-device. (11/8/27.)
295 330 Allgemeine Elektricitatsges. Thermionic valves. (9/8/27.)
295 402 British Thomson-Houston Co., Ltd. Electric protective arrangements. (11/8/27.)
309 901 Submarine Signal Co. Distance or depth finding systems or apparatus. (17/4/28.)
295 640 International General Electric Co., Inc. Terminal boxes for multicore cables. (15/8/27.)
321 246 British Thomson-Houston Co., Ltd., and L. B. Ault. Sound-reproducing devices. (16/8/28.)
309 902 L. M. Ericsson Telefonaktiebolaget. Means for operating wireless sets from supply mains or machine generators. (17/4/28.)

Applications for Patents.

October 25th.

32 416 J. H. Aitchison, H. Bull, and L. Johnson. Electrodes or rods for welding.
32 501 Almeida Accumulators, Ltd. Secondary cells.
32 513 W. Ball. Means for locating electric light switches, etc.
32 507 E. Bornand, and H. A. Schlaepfer. Induced current furnaces. (3/11/28, Switzerland.)
32 448, 32 449 S. N. Bourne, ans British Thomson-Houston Co., Ltd. Electric switches.
32 465 F. H. Collis, and J. Sax and Co., Ltd. Electric switches.
32 430 A. F. Cornock, and General Electric Co., Ltd. Circuit breakers.
32 451 S. Davis, and Ormond Engineering Co., Ltd. Electric switches.
32 461 H. C. Holmes, J. A. A. Taylor, and A. Warwick. Electrical distributing systems.
32 462 H. C. Holmes, J. A. A. Taylor, and A. Warwick. Distribution of wireless programmes.
32 400 L. H. L. Lewis. Electric switch.
32 418 L. McMichael, Ltd., and E. J. Pound. Thermionic valves.
32 490 K. de Proszynski. Electric loud speakers.
32 480 R. N. Wellington. Electric switches.
32 516 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Loaded submarine cables.

October 26th.

32 452 J. H. and W. E. Doyle. Storage battery.
32 595 Electroacustic Ges. Subaqueous sound apparatus. (1/4/29, Germany.)
32 613, 32 614 Gramophone Co., Ltd., and M. Bowman-Manifold. Television, etc., systems.
32 542 J. Holmes, and Holmes (Bias Fabrics), Ltd. Electric insulating tape, etc.
32 526 N. V. Philips' Gloeilampenfabrieken. Photo-electric cells. (12/1/29, Holland.)
32 593 W. L. W. Schallreuter. Electric gas discharge vessels.
32 498 Siemens and Halske Akt.-Ges. Circuit arrangement for trunk communicationsystems. (25/10/28, Germany.)
32 561 J. Y. Walsh. Resistances.

October 28th.

32 638 A. W. Abbott. Electrical switch lock for motor vehicles.
32 639 R. J. Aiken. Control of electric switches.
32 750 F. Aldrovandi. Alternating current lighting systems. (29/10/28, Italy.)
32 759 W. Altner. Electrical indicating devices. (10/12/28, Mexico.)
32 742 Automatic Telephone Manufacturing Co., Ltd., and L. M. Simpson. Electric totalisators.
32 764 Z. Bay. Operating electric illuminating tubes. (26/10/28, Hungary.)
32 667 J. R. Bayes. Primary batteries, etc.
32 677 British Thomson-Houston Co., Ltd. Electrical apparatus. (27/10/28, U.S.).
32 679 British Thomson-Houston Co., Ltd. Speed indicating systems.
32 680 British Thomson-Houston Co., Ltd. Power converting apparatus.
32 758 I. Brook. Burglar, etc., alarms.
32 725 S. G. Brown. Electric bells.
32 754 S. G. Brown. Sound reproducing instruments.
32 643 R. W. Butterfield. Electric pocket lamps.
32 721 T. W. Corbin. Electrical testing apparatus.
32 715 H. Elsner. Accumulators. (26/3/29, Germany.)
32 728 H. C. Holmes, J. A. A. Taylor and A. Warwick. Distribution of electrical signals.
32 681 Hotpoint Electric Appliance Co., Ltd., and W. J. Sims. Electric heating units.
32 706 Igranic Electric Co., Ltd. Mercury timing relay.
32 632 F. W. Lanchester. Wireless reception, etc., apparatus.
32 756 W. Peter. Device for passing cables through roofs of buildings.
32 752 Rothsaccumulator Aktiebolaget. Electric power plants. (13/11/28, Germany.)
32 653 F. Wood. Electric pick-ups, etc.
32 706 S. R. Wright. Mercury timing relay.

October 29th.

32 887 H. P. H. Anderson and A. Henderson. Watertight gland for electric cables.
32 855 British Thomson-Houston Co., Ltd. Thermionic valve amplifying systems. (20/11/28, U.S.)
32 825, 32 826 Celia, Ltd., and J. J. Drumm. Secondary batteries, etc.
32 863 F. Ehrenhaft. Electrical transmission of talking films, etc.
32 843 Electrical Research Products, Inc. Magnetic materials. (13/12/28, U.S.)
32 865 Ever-Ready Co. (Great Britain), Ltd., and A. H. Sheppard. Electric torches, etc.
32 812 E. F. Goodman and Veloce, Ltd. Electrical equipment of motor cycles.
32 847 H. H. Henning. Receptacles for electric heating of liquids.
32 838 A. E. Honey and J. Stone and Co., Ltd. Electric regulators.
32 824 L. and L. C. King. Apparatus for use with telephone systems.
32 821, 32 822 H. Leben and A. Reyrolle and Co., Ltd. Electric protective systems.
32 823 A. Reyrolle and Co., Ltd., and G. R. Wilson. Cord grips for conductors.
32 880 E. W. Stapleton. Wireless receiving apparatus.
32 856 Telefonaktiebolaget L. M. Ericsson. Signalling systems. (30/10/28, Sweden.)
32 864 H. Vogt. Electrostatic loud speakers, etc.
32 796 Watford Electric and Manufacturing Co., Ltd. Control apparatus for spinning frames.

COMING EVENTS.

Friday, February 21st (To-day)-Friday, February 28th.

London and Birmingham.—British Industries Fair.

Friday, February 21st.

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. S. H. Hart on "Paper-Insulated Power Cables." 6.15 *p.m.*

Institution of Electrical Engineers (North-Eastern Students' Section).—Armstrong College, Newcastle-on-Tyne. Address by Mr. B. A. Robinson on "Electrons and Engineers." 7.15 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, Strand, London. Conference on "The Electrical Industry and the Architect." Speaker, Mr. C. H. Flower. 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster. Paper by Mr. E. P. S. Gardner on "The Application of Electric Welding to the Erection and Strengt hening of Steel Structures." 7.30 *p.m.*

Saturday, February 22nd.

Association of Supervising Electrical Engineers.—Hotel Cecil, Strand London. Annual dinner.

Monday, February 24th.

Electrical Contractors' Association (Ealing Sub-Branch).—Ordinary meeting.

Institution of Electrical Engineers (North-Eastern Centre). Sopwith's Lounge, Northumberland Street, Newcastle-on-Tyne. Informal discussion. Opened by Messrs. P. B. Addison and A. G. Shearer. 7 *p.m.*

Tuesday, February 25th.

Electrical Contractors' Association (Chesterfield Sub-Branch).—Falcon Café. Ordinary meeting.

Royal Institution of Great Britain.—John Street, Adelphi, London. Lecture by Sir William Bragg on "X-ray Determination of the Structure of Cellulose." 5.15 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch." 7 *p.m.*

Electrical Power Engineers' Association (London Technical Group).—Junior Institution of Engineers, 39, Victoria Street, London. Paper by Mr. A. W. Crompton on "Changing d.c. Networks to a.c." 7.15 *p.m.*

Paisley Association of Electrical Engineers.—Lecture on "Automatic Telephony," by Mr. A. Thomson, and visit to the Paisley Post Office.

Wednesday, February 26th.

Electrical Contractors' Association (Croydon Branch).—Ordinary meeting.

Electrical Contractors' Association (Belfast Branch).—5, Bedford Street. Ordinary meeting. 3.30 *p.m.*

Electrical Power Engineers' Association (Manchester Local Technical Group).—Paper by Dr. A. T. de Mouilpied on "Low Temperature Carbonisation of Coal."

Overhead Lines Association.—Georgian Restaurant, Messrs. Harrods, Ltd., Brompton Road, London. Conversazione, with exhibits, supper and dance. 8–12 *p.m.*

Thursday, February 27th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Faraday lecture on "Broadcasting by Electric Waves," by Captain P. P. Eckersley. 6 *p.m.*

Institution of Welding Engineers.—Caxton Hall, Westminster, London. Paper by Mr. J. Ryder on "The Training of Operators in the Welding and Cutting Industries." 7.45 *p.m.*

Friday, February 28th.

Institution of Electrical Engineers (West Wales-Swansea Sub-Centre).—Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch."

Electrical Association for Women.—Club Room, Kensington Court, London. Lecture by Mr. L. L. Robinson on "Tariffs." 3 *p.m.*

Imperial College of Science.—Imperial Institute Road, South Kensington. Paper by Mr. R. O. Cherry on "Field Intensity Measurements Around Some Australian Broadcasting Stations." 5 *p.m.*

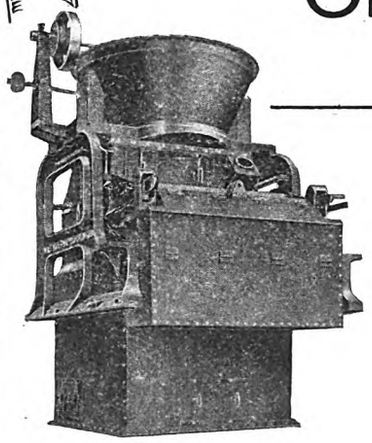
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY PATENT AUTOMATIC WEIGHER FOR PULVERISED FUEL
LIST 1177.

The Avery No. 52 Automatic Weigher for Pulverised Fuel gives without dust escape, correct records of fuel consumption. The machine illustrated weighs 50 tons per hour from an Overhead Storage Hopper, and delivers to the pump. Thus, accurate records of fuel consumption are automatically kept, losses are instantly detected and economy achieved.

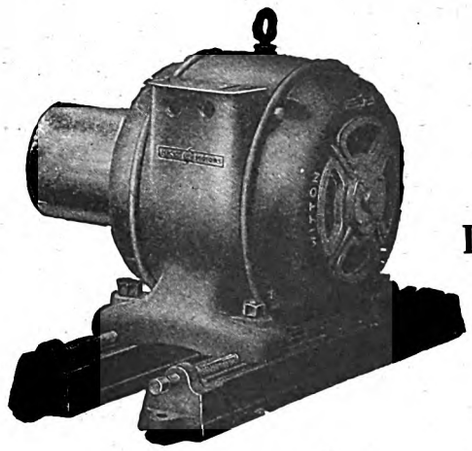
The Specialists in handling, weighing and blending machinery. Complete plants supplied.

W. & T. AVERY, Ltd.,
Soho Foundry, BIRMINGHAM.

1769

TRADE MARK
HIGGS (HM) MOTORS
PROPRIETOR WALTER F. HIGGS, M.I.E.E.
WITTON BIRMINGHAM

A.C. D.C.



HIGGS MOTORS are the first firm in England to manufacture single phase repulsion start induction motors, fitted with brush lifting and short circuiting device (known as type "S"). With twice times full load current from the line they have the phenomenally high starting torque of three times full load torque, and in addition, they are silent in operation. They are admirably suited for driving domestic machinery, organ blowing, etc

Future of the B.I.F.

EXAMINATION of the electrical stands in the Birmingham section of the British Industries Fair and conversation with the exhibitors could hardly fail to give rise to a variety of reflections, not, indeed, as numerous as the goods displayed, but ranging over a wide field. There was, even more than on previous occasions, a great deal to interest the visitor. A fine assortment of electric cookers and fires; thermostat controlled geysers and the smaller appliances associated with domestic electrification; glassware for electric lamps made in Birmingham at prices which leave Czecho-Slovakian glass behind; automatically controlled road traffic signals; moulded compositions of beautiful texture, great strength and a multiplicity of finishes; furnaces, and many other features were there to tempt the buyer not only to look but to purchase. The goods were there, but were the buyers?

It is difficult to give a general answer to that query. Now that the Fair is open to the public, with the possibility of seeing some members of the Royal Family thrown in as an additional attraction, there are always a number of people in evidence. But the Fair is not held as a sightseeing enterprise, and those who go to the trouble and expense of occupying stands are after fish of quite different species. Replies to inquiries as to the amount of genuine buying interest attracted by the Fair at Birmingham are always contradictory. Some exhibitors express satisfaction, others are non-committal, and a third category are definitely pessimistic. To some extent, this diversity may represent differences in the character, as distinct from the quality of the exhibits, and it is doubtless in part a reflection of the temperaments of individual exhibitors. On one point, however, there appears to be fairly general agreement—foreign buyers have, as in former years, not been conspicuous. And since one of the major reasons for holding the Fair is to give foreign buyers an opportunity of seeing what British manufacturers can offer them, on this head there is certainly ground for dissatisfaction with the response evoked, at any rate in the case of the Castle Bromwich section of the Fair

Two reasons are put forward in explanation. The first relates to season and the second to locality. It is recognised that there are objections to holding the Fair later in the year; but it is felt that the reputation of February in England is a serious deterrent to possible visitors from the Continent, especially from the more distant countries, and that the season is even less suitable in the case of Oversea buyers. Opinion regarding locality is less unanimous, but there is a widespread feeling that the virtual monopoly of interest secured by the Olympia section of the Fair in the London daily Press is a severe handicap. There is full recognition of the organising ability and energy displayed by the Birmingham management, but exhibitors from other parts of the country are beginning to ask themselves whether it would not lead to a considerable increase in the attendance of foreign buyers if the two sections of the Fair were both held in London.

These points will be considered by the committee, under the chairmanship of Lord CHELMSFORD, which has been appointed by the President of the Board of Trade "to examine the present situation as regards the British Industries Fair and to consider what means can be adopted to increase still further its utility to British trade." The desirability of holding a second fair in the autumn, limitation of participation to manufacturers, methods of advertising at home and abroad, finance, the possibility of holding the Fair, or sections of it, at centres abroad, and the organisation of a travelling fair on ships or trains are other points included in the scope of the committee's investigations. With experience extending over a decade to draw upon the time is ripe for a thorough inquiry into the results achieved and the policy to be pursued in the future, and the appointment of this representative committee is a wise action on the part of the Government. It is now up to exhibitors to see that their views are formulated, co-ordinated and properly presented for consideration.

Current Topics.

Television Progress.

A RECENT report from America referred to a photograph being transmitted to Sydney, and re-broadcast, by *television*, whereas a glance at the somewhat misleading account left the instructed reader certain of one thing only—that the experiment was concerned with phototelegraphy. As electrical engineers have themselves only lately decided whether to speak of "phototelegraphy" or "telephotography" it is hard indeed for the general public to follow these modern developments. Television, at all events, is at length making some progress in this country. The Baird Co. hope to start simultaneous transmission of image and speech when the Brookman's Park tests are completed at the end of March, and if regular facilities for such broadcasts cannot ultimately be provided by the B.B.C., the Baird Co. have good reason to believe that permission will be given them to erect their own station—probably on a site in Essex. If this course is adopted, a permanent land line will be laid between the station and Savoy Hill, where a portable television transmitter will be at the service of any artist. By this means it is hoped that the present variation in the results obtained—due largely to the use of miscellaneous telephone circuits between Long Acre and Savoy Hill—will be greatly lessened.

Ship-to-Shore Telephony.

IT is much to the credit of the Post Office engineers and of the International Marine Radio Co. that a telephonic communication with the "Majestic" has been achieved so soon after the experimental success obtained with the "Olympic." It is true that preliminary experiments have been carried out for a number of years, but the difficulty of separating the incoming and outgoing waves on the ship has been overcome only lately. The receiving station is at Baldock, in Hertfordshire, which has lately been used as an auxiliary to Cupar for the transatlantic service, while Rugby acts as transmitter for both services. Short waves are used and both transmitting and receiving equipment was made by the Standard Telephone and Cable Company. The ship-to-shore charges fixed by the Post Office are considerably lower than those agreed upon by the American Telephone and Telegraph Co., for the service inaugurated by the "Leviathan." Here the minimum is £4 10s. for three minutes; the corresponding American fee is from £7 to £11, according to the telephonic "zone" occupied by the subscriber on land. It is worth noting that the charge for a British call to an Atlantic liner is only half that made for a call to New York—though the liner may be 3 000 miles across. One may hope that this foreshadows an early reduction in the transatlantic rate.

Neat Layout at Leicester.

THE City Electricity Committee and Mr. JOHN MOULD, the engineer and manager of the Leicester Central Generating Station, had a beautiful day on which to display the enlarged station to a number of interested visitors last week. It was the general opinion that Councillor SWAIN, the chairman of the Electricity Committee, Mr. MOULD and the contractors are to be congratulated on a very neat and efficient job which thoroughly deserved Sir ANDREW DUNCAN'S description of it as one of the tidiest layouts in the country. A feature of special interest is, as Mr. MOULD pointed out, that the station has been designed to burn the fuel which is at its doorstep—Leicestershire slack—"the worst coal in the country." In thermal efficiency the new Leicester station stands well at the head of the 23 large stations which burn really bad coal. Mr. MOULD and his assistants can legitimately pat themselves on the back for this achievement. The low capital cost per kW of plant—when further extensions for which the new buildings leave room have been added, it will only amount to £10·3 against an average in the United Kingdom of more than double that figure (£21·2)—is another cause for satisfaction. We understand that the Central Electricity Board's time-table contemplates the linking of the Leicester and Nottingham stations by the grid in October next.

Home Electrification.

THERE is no doubt that the Practical Course on Home Electrification arranged by E.D.A., E.L.M.A., and E.A.W. was a great success. The 135 women from all parts of the country who attended the lectures and salesmanship demonstrations were keen and enthusiastic disciples. Many appreciative letters from women who attended have since been received by Col. VIGNOLES and the gospel of domestic electrification will be spread in widening circles by these fresh missionaries. It is the housewife who can make or mar the market for domestic electric appliances and the time is overdue for a much larger programme of electrical education for women which should begin in the schools.

Construction Activity in America.

AMERICAN manufacturers may be passing through difficult times but the electric light and power utility companies are far from dismayed by the outlook, judging by their construction programme for 1930. Figures collected by the N.E.L.A. from companies representing 85% of the power industry give the total estimated expenditure on new construction in the first quarter of this year as $198 000 000 or 10½% above the amount in the corresponding quarter of 1929. Orders placed or to be placed before March 31st with manufacturers of equipment and materials will amount to $180 000 000 representing 38½% of the estimated total for the current year. This is regarded as an indication that the programme of extensions for 1930 is well in hand.

Simulating Sunlight.

DR. M. LUCKIESH, Director of the Incandescent Lamp Department of the G.E.C. Lighting Research Laboratory at Cleveland, Ohio, read a paper on "Simulating Sunlight" at a recent joint meeting of the American Illuminating Engineering Society and the A.I.E.E. He described a combination of a mercury arc and a tungsten filament in one bulb evolved by the American G.E.C.'s engineers. The components operate together in pure argon "as if they had never been engaged in a struggle for supremacy in the lighting field." This type S-1 Sunlamp is a low voltage source and the volt-ampere characteristic of the transformer is important. The glass of the bulb has a suitable spectrum cut-off. As measured in foot-candles, the S-1 Sunlamp is at least 20 times more effective than good summer sunlight. Whether, as Dr. LUCKIESH believes possible, this type of lamp will open a new era in lighting remains to be seen, but it is a very interesting development which may well have far-reaching results.

ELECTRICAL EXPORT TRADE OUTLOOK.

Effects of British Financial Policy—More Orders Received Since the Hague Conference—Canadian Market Improving—Increasing British Penetration in Other Countries.

By HUGH QUIGLEY.

THE British electrical industry had a record volume of shipments during 1929 and, to some extent, participated in the expansion which took place in the world demand for electrical equipment. Inclusive of steam turbines and condensers, the total value of British exports amounted to rather more than £20 500 000, which was almost exactly £500 000 more than the total recorded during the previous record year, 1926. Compared with Germany and the United States, however, the expansion shown by Great Britain was comparatively small. Both of these countries increased their shipments by several million pounds each during the year in question ; but one can perhaps find an explanation for the loss of position suffered by Great Britain during this year.

In the first place, the special markets served by the British manufacturer, namely, Australia, India, South Africa, New Zealand, Argentina, Japan, and to some extent Russia, almost without exception, suffered from severe trade depression during the latter half of 1928 and the beginning of 1929, and expenditure on electrical equipment suffered accordingly. On the other hand, the special markets supplied by the United States showed a rapid expansion in imports, the most spectacular examples being Canada and Great Britain. The very large increase which took place in imports of electrical apparatus into this country must be attributed to developments in connection with sound films, telephonic and wireless communications generally, and the expansion of the market for domestic and other appliances. It is already sufficiently clear that the market in those products is large enough to justify a much more determined effort on the part of the British manufacturer to meet American competition and secure a much higher percentage of the demand than hitherto.

Again, as part of the American policy of financial penetration, especially in Europe and South America and the East, there has been a diversion of orders to American manufacturers, with its consequencies in increased shipments. The boom in American industry rendered it possible for electrical manufacturers to achieve high volume production, realise very large margins of profit and obtain financial resources for the purpose of purchasing public utilities abroad.

The German position is one of considerable interest. It is true that British manufacturers have not suffered to any great extent from German competition, since the increase that has taken place in the exports from that country has been due, above all, to the operation of reparation deliveries in kind and to the increasing hold of German manufacturers on the European demand, above all, in Central, Eastern and Far Eastern Europe. Europe, as a market, has shown much the greatest expansion of any other part of the world since 1927, and much of this expansion has been due to the special facilities and the special credits granted by Great Britain to European countries ; facilities represented by the funding of the various debt settlements and by the transfer of short term credits from London to European centres. Thus, this country has been engaged in financing European prosperity, while British industry has not had any share in such prosperity and has not benefited from such financial policy. The country which has reaped full advantage has been Germany.

Strong Competitive Power.

In view of these circumstances, the export position of Great Britain during 1929 must be considered as very satisfactory, and it does show that the competitive position of the industry is very strong. Some indication of this strength can be found in developments that have taken place since the middle of 1929, when a number of those special factors encouraging German and American exports have either been mitigated or removed. The Hague Conference, for example, has placed a very narrow limit on reparations deliveries in kind, while the credit stringency accompanying and following the American slump has rendered it extremely difficult for Germany and European countries generally to borrow in this country, either for short term or long term purposes.

The result is already evident in the very rapid expansion which has taken place in orders secured by British firms for heavy generating plant and equipment ; in the rapid decline which has taken place in the orders secured by the German firms, both on home and export account, and in the fairly severe restriction of activity which has characterised electrical manufacture in the United States. There has been, therefore, some movement towards adjustment of the international competitive position, but one may debate whether such adjustment will ultimately be of advantage to British industry.

It will probably lead to intensification of competition in a number of what might be regarded neutral markets and thus render expansion on normal lines somewhat difficult. In any case there are prospects that British export shipments during 1930 will show a further expansion on 1929 and will bring this country, once more, into line with Germany and the United States. There are sufficient orders on hand at the moment to ensure continuous activity for well over a year.

Active Markets.

The main markets in which the British electrical manufacturers have been specially active in recent months have been Europe, South America, Australia and India ; while Canada is at last showing some appreciation of the fact that reciprocity in trade is essential to trade prosperity and that support of British production must accompany the British support of Canadian production. The slump in the United States has shown that there may be danger for Canada in being too closely linked up, economically, with that country.

The most important change that can be determined from the survey of British activity has been that the British electrical product is now penetrating into a number of markets which, until only a few years ago, showed no desire for any other than German or American products. Such a penetration is due, above all, to the fact that as a result of continuous activity during ten years the British industry has established a series of very valuable records, in efficiencies and in operating results, especially in generating plant and equipment, and such a record is beginning to have an international cumulative effect. One can expect that such goodwill will be an increasingly important element in determining international competitive position and in ensuring that a fair percentage of orders, even in European markets, will come to this country.

It is difficult to prophesy with any certainty the immediate future of the electrical export trade generally. There is at present every indication of a coming international economic crisis. The first important indication of a serious position arising was the American Stock Exchange slump in the late autumn of 1929, which followed similar slumps in the Stock Exchanges of Europe and the Dominions. The American slump was due more to a very marked recession in trade than to a withdrawal of funds from New York to Europe, and it was accentuated by a severe fall in world commodity prices which took place as a result of financial policy already outlined. Such a fall has borne, above all, on the following products : wheat, coffee, tin, rubber, tea, nitrates, zinc, lead, silver, sugar, wool, cotton, and to some extent, copper. It has brought severe trade depression on the countries depending on such commodities, above all, Central and South America, Canada, the middle western States of America, Australia, New Zealand, Dutch East Indies and the Federated Malay States, India and Ceylon. In addition to this, the wholly unnecessary imposition of the gold standard on India, in place of the silver standard hitherto in operation, has converted India from a buyer of silver to a seller on a very large scale ; and the price of silver has fallen from 28d. per oz. to 19d., in not much more than one year. Such a fall has brought with it a collapse in the purchasing power of the entire Indian, Burmese and Chinese peoples, and this fall has been shown in the very severe unemployment now ruling in the textile industries of Lancashire and Europe, while it has arrested the upward industrial movement which was taking place in India.

In view of these developments it is difficult to be optimistic about the future of the export trade in any commodity, including electrical equipment. The electrical industry is affected almost at once by general trade depression, largely from the fact that it supplies equipment to all industries and electrical energy forms an increasingly important part in industrial productive capacity. There may, of course, be a revival in commodity prices, resulting possibly from a reversal of the process which has brought about such a fall ; and it is to such a revival that the British electrical industry, in common with other exporting industries in this country, must look for expansion in shipments within the next few years.

OPENINGS IN CANADA.

Vast Power Development in Progress—Can British Manufacturers Improve their Sales in the Dominion?—Possibility of Tariff Changes.

(FROM A CANADIAN CORRESPONDENT.)

CANADIAN business during the past few years has suffered grievously from the repeated attempts of politicians in the United States to enact prohibitory duties against Canadian exports, and much anxiety has therefore been caused on the Canadian side of the line whenever these threats have assumed definite shape in Congress proposals. "Buy from those who buy from us" is now the slogan, and it is practically certain that the Budget Speech of the new Canadian Minister of Finance will contain a very large number of tariff changes concentrated mainly on the iron and steel schedule. In the case of machinery the Government has given no indication of its intentions apart from numerous hints that whenever possible without injuring Canadian industry efforts will be made to direct trade to Great Britain in preference to the United States.

Canadian imports of what are classified as "electrical apparatus, not otherwise provided for," including such items as batteries, lamps, lighting fixtures, meters, motors, spark plugs, switches, telegraph instruments, telephone instruments, wireless apparatus, etc., reached a total value in 1928-29 of $26 775 215, a large increase as compared with the $19 044 465 recorded for the previous year. Great Britain supplied products worth only $1 927 193, as compared with the huge total of $24 410 750 from the United States. In machinery, the predominance of the United States is equally evident and British manufacturers appear to have failed almost completely to make known to the Canadian public the immense improvement in the capacity of the industry here to supply up-to-date plant suitable for Canadian requirements.

The immense market developing during the next few years can be judged from the fact that new installations brought into operation last yeat totalled 378 400 H.P. of hydro-electric energy, bringing the total installation up to 5 727 600 H.P. This in addition to a considerable increase in the utilisation of small Diesel engine and fuel plants in out-of-the-way mining camps, and in large hotels, business buildings, and so on.

Wa er power developments now under active construction will, according to published programmes, add more than 1 600 000 H.P. to the present total during the coming three years, and there are many large new projects under consideration which are certain to materialise in practical decisions before many months have passed. The capital expenditure upon these power developments will be paralleled and probably exceeded by the cost of transmission and distribution, and the greater utilisation of electricity will expand the market for every type of appliance associated with this form of energy. The adoption generally of the Canadian National Electric Code should remove the obstacles to business which have undoubtedly discouraged British competition in the past, and it would be well for firms who have not yet considered the question of opening branch factories, assembly plants or warehouses, to investigate the possible advantages of doing so in the near future.

Immense Potentialities of the Market.

The figures which have been published recently by the Dominion Water Power and Reclamation Branch emphasise what is now generally agreed as to the immense power resources of Canada, and the potential market is therefore on a scale justifying unusually thorough investigation and strenuous efforts in order to secure adequate participation by British manufacturers. Whether this participation can be secured by reliance upon long-distance selling assisted by the "Preferential Tariff" is open to some doubt, though in certain lines good salesmanship may enable firms to market electrical apparatus by appointing agents at numerous points and backing them up energetically by advertising. Canadian power plants are, however, staffed by engineers who have lost, or who have never been trained in the habit of long-distance purchasing, and they would with difficulty be persuaded to place orders a long time ahead for large machinery specially made by British manufacturers unable to promise immediate delivery of repairs and spare parts when needed.

British manufacturers, established in Canadian factories and importing under the drawback system many articles free of duty, or under advantageous terms, whether for the home trade or export to countries in the North American sphere of influence, should, however, be in a good position to watch developments and to plan ahead for the business to be expected both in the provision of machinery for power plants, as well as for transformers, and the innumerable items of equipment in distribution systems, homes, factories, etc., resulting from the further use of electricity. Canada has an estimated available water power totalling 20 347 400 H.P., which could be utilised for twelve months of the year, or on the six months' basis, no less than 33 617 200 H.P., and this total is estimated to justify a total installation of about 43 700 000 H.P. The existing installation is only about 13% of the recorded resources, but as about three million H.P. is likely to be harnessed in the near future it is evident that there is no halt in development. The capital investment in hydro-electric power developments now reaches about $1 302 000 000 and the annual expenditure during the next few years will reach not less than $90 000 000. A certain amount of electricity is generated by steam-power plants, and the collieries of Nova Scotia are practically all using electricity derived from large-scale plants utilising pulverised fuel.

Mammoth Schemes Planned.

A number of mammoth schemes are peing planned, the largest being one involving the ultimate development of about 2 000 000 H.P. by the Beauharnois Power Corporation on a stretch of the St. Lawrence close to Montreal, between Lakes St. Francis and St. Louis. The initial output is to be 500 000 H.P., and a market for this has already been found among existing power interests. The establishment of new industries along the power canal is a likely possibility, leading obviously to the use of much electrical equipment of every description. The Shawinigan Water and Power Co. is enlarging its resources on the St. Maurice River, and on the Saguenay the Alcoa Power Co., Ltd., is constructing a plant to produce 1 000 000 H.P. with immense turbines of about 80 000 H.P. capacity. Every province is partaking in this progress, with the sole exception of the small farming province of Prince Edward Island, and the rapid opening up of mining in northern areas renders indispensable the establishment of larger or smaller power plants.

The load on the lines of the Montreal Light, Heat and Power Consolidated is increasing by about 15% annually, and the Gatineau Power Co.'s immense system is experiencing no difficulty in marketing all the energy it can produce at its numerous large sites in the Ottawa Valley. In the vicinity of Lake St. John 2 000 000 H.P. is being developed with every prospect of securing a market, and during the next seven years Quebec is likely to be increasing its output of power by more than 2 040 000 H.P. As the present installations total about 2 235 000 H.P., the magnitude of the advance contemplated needs no emphasis, and a power shortage of not less than 75 000 H.P. before 1936 is not unlikely.

The plans of the Ontario Hydro-Electric Power Commission for the current year contemplate a total expenditure of $40 000 000, partly on new power developments along the Ottawa River and in the northern mining districts and partly in connection with the duplication of the transmission lines bringing energy from the Gatineau power plants in Quebec. Extension of rural electric power lines will absorb about $5 000 000; 1 200 miles of new lines will be constructed. The tenth unit is to be put in at the Queenston plant on the Niagara River at a cost of $4 000 000.

It would be unfortunate if this immense opportunity for business should pass by without some benefit for the British maunfacturer, but without some energetic effort both by manufacturers, salesmen and financiers, it is inevitable that the lion's share will pass to the Canadian plants already established. The United States manufacturer also must benefit from proximity, although the public in the Dominion has never been more sympathetic to the "Buy British" appeal than it is at the present time. Ocean freight rates to the Pacific Coast, to the new port of Churchill on Hudson Bay, as well as to the somewhat limited markets in the Maritime Provinces and to points in the neighbourhood of Chicoutimi, Quebec and Montreal, should tend to offset many of the advantages possessed by engineering firms on the North American continent who have to deliver by rail.

ELECTRICITY ON NEW ZEALAND FARMS.

Assistance Given by Power Boards—Charges for Current—Hire Purchase System for Apparatus—Cultivation of the Milking Load.

AT a meeting of the Overhead Lines Association held at the Institution of Electrical Engineers on February 19th, Mr. W. P. Gauvain described the work that has been done in New Zealand on rural electrification. He said that so far the use of electricity on New Zealand farms was limited, probably due to climatic conditions, and was chiefly confined to the driving of milking machines and cream separators, for pumping water, and to a smaller extent for shearing. In addition to the power required for these plants, extensive use was made for water heating in the milking sheds, whilst the purely domestic load consisted of lighting, cooking, water heating and the usual labour saving appliances. The paramount difficulty was the capital cost of the installation and the Power Boards, by instituting a system of financial assistance to consumers, were of considerable help to the prospective consumers, who were usually required to pay one-third of the cost of the installation in cash and the balance spread over a period of three years. Under the Electric Power Boards Act of 1918 the Boards were granted trading powers and to a great extent they carried out the complete installation with their own staffs, the resulting profits going to swell the funds of the undertakings. For successful country electrification effective service was essential and the arrangements were such, so far as the milking load was concerned, that if a motor failed during milking a spare one would be installed in time for the next milking.

In March, 1929, there were 10 200 electrically driven milking machines and a further 8 000 driven by some other method. In the milking sheds electricity was largely used for heating the water required for cleansing the machines and utensils. The element was connected to the circuit through a double-throw switch so that the heater was not in use when the milking motor was running; the current for this work was not metered but was charged on a flat rate varying from £6 to £8 per 1 000 watts *per annum*, equivalent to from 0·26d. to 0·35d. per unit during the time the heater is in operation. The sizes of these milking machine motors varied from 1 H.P. to 3 H.P., but by far the greater number were of 2 H.P. capacity and the rates were a fixed charge per H.P. of connected load, plus a unit charge. The average cost worked out at from 3d. to 4d. per unit and at these figures it was possible, when taking total costs into consideration, to compete with the petrol engine which was almost universally employed prior to the introduction of electricity. There was still room for extensive development in the domestic load in rural areas, more particularly in the use of cooking appliances; electric cookers had been installed by 7·6 per cent. of the consumers and water heaters by 11 per cent.

Power was used by the dairy factories, quarries, saw mills, flax mills, brickyards, freezing works and sundry industries. The combination of the supply to these undertakings together with the domestic and farming loads enabled a high average annual load factor to be attained, which for all distributing authorities in 1929 was 46·6 per cent., whilst several of the power Boards showed figures greatly in excess of that. The maximum charge for domestic lighting in rural areas was about 8d. per unit, and for domestic power the rates began at 3d. per unit and went down to 1½d. A number of Boards had minimum domestic power rates of 1d. but it was found that the 1½d. rate would attract cooking loads in the country areas.

Results in a Typical Area.

As indicating the results which might be attained in a typical rural area the following details from the Annual Report, for the year ended March 31st, 1929, of the Thames Valley Electric Power Board were given. The Board controls an area of 2 300 sq. miles containing a population of 40 800 or an average of 17·7 persons per sq. mile. The largest town had a population of under 5 000 and there are three towns of approximately 2 000 inhabitants, each together with a number of villages. Power is also supplied to 22 dairy factories, 9 quarries, 3 saw mills, 3 flax mills, and 2 Government workshops. The motors in use total 2 593, of which 1 793 drive milking machines, 352 are used on general farm work and 448 for industrial purposes. There are 1 278 circuit miles of distribution lines and 424 miles of service lines. The revenue was £98·4 per circuit mile. The total capital expenditure was £720 600 and the revenue £125 792 or 17·5 per cent. on the capital expended. The number of transformers in use was 437 having a total capacity of 11 219 kVA or an average of 25·7 kVA per transformer. The maximum demand on the system was 5 220 kVA, the annual load factor 66·1 per cent. the power factor ·0933 and the units sold per head of population for the year 486. Consumers number 6 968 and the revenue per consumer was £18·05 and per head of population £3·08, whilst the revenue per unit sold was 1·52d. The units sold per route mile of distribution line totalled 28 700. Capital charges amounted to 47·5 per cent. of the total costs, purchase of power 33·1 per cent., and management, distribution and maintenance 19·4 per cent.

Financial Return.

The capital expended by the Government on hydro-electric schemes to March 31st, 1929, amounted to £8 468 000 whilst the expenditure by Power Boards only, exclusive of other supply authorities, totalled £12 010 000. Forty-three Power Boards were constituted of which thirty-eight were distributing power. After paying interest and sinking fund on capital expended, together with operating and maintenance costs, the profit amounted to £100 500. The total length of distribution lines of all supply authorities was 17 760 route miles, the number of consumers per route mile was 15, the maximum power demand 8·15 kilowatts, and the sales 30 600 units producing a revenue of £211.

The relationship between the Boards and the public works and other Government Departments, such as the post and telegraphs and railways, was happy and was fostered by the appointment of standing committees which met periodically, and by annual conferences at which all debatable points were fully discussed. The regulations regarding the supply of electricity were periodically reviewed and were not altered or modified until the Boards had had the opportunity of stating their experience on the points raised, and placing their views before the Department.

It was gratifying that the majority of electrical plant installed in the Dominion was of British manufacture, and the Boards were most anxious that this state of affairs should continue.

Mr. GAUVAIN, replying to the discussion, said it was difficult to say how far practice in New Zealand could be applied in this country. The milking load had been cultivated and he wondered why it had not been developed here because there were 18 000 milking machines in use in New Zealand and no farmer with 20 cows or more would think now of adopting the old method of milking. The average size of storage tank in the milking sheds was 10 to 20 gallons and the load was simple to handle because the water was only required at certain times during the day, and during the intervening period the heating up was going on. In the houses the tanks were about 30 gallons capacity, the current being switched on for two hours in the morning and two hours in the evening, off the peak load. The elements were usually 750 to 1 250 W.

The price obtained for current was not so high as might seem at first. The charge for milking was 3d. to 4d. per unit and for water heating 0·3d. per unit, so that if the two were taken together the average for the milking shed came out to about 1d. per unit, and although farmers used to complain that the price was high in comparison with the cost of running an oil engine, it was found that the comparison was made without taking into account the cost of repairs or spare parts and cartage of the petrol from the railway station. As to 17½% revenue on the capital expenditure being rather low, the Power Boards were not out to pay large dividends. All they had to do was to pay interest and sinking fund and depreciation, and none of the Boards were allowed to raise money at a higher rate than 5½% without special permission of the Minister of Finance. There were very few 3 kW transformers in use and only a few on the 11 000 V lines. They rather liked to group farms together and use a larger transformer. An air break type of switch was used and the fuse was made in New York and was known as the S. and C. type. In New Zealand it was practically always dark by 8 o'clock in the evening, even in the summer time, and 10 units per month was a good lighting consumption of farm premises. The l.t. supply was 415/240 V. People in New Zealand seemed to like to feel that they owned the apparatus, and for that reason hire purchase had been cultivated.

POWER SUPPLY IN BELGIUM.

Many Generating Stations—Soil Conditions which Favour Use of Underground Lines—Co-operative Supply in the Liège District.

(FROM A CORRESPONDENT.)

BELGIUM is one of our nearest neighbours, it is the most densely populated and most industrialised state in the world; it was celebrated in the middle ages as a centre for textile industries, before our Tudor sovereigns adopted a national policy to encourage the making of woollen goods at home; in fact, such was the influence of British wool over the Low Countries that the Lord Chancellor at Westminster still sits on the Woolsack to remind him of the importance of trade and industry.

The Belgian workman works hard, and has never paid much attention to the ca' canny agitators who, in some lands, encourage the "killing of the goose" to create that unhappiness and unrest on which they naturally live. There has been, therefore, a great demand for power; a material proportion of the total power generated per year is from private works power stations.

There are quite a large number of central stations, which some people in other countries might consider an obstacle to the supply of cheap power; low grade coal, which can be supplied in many regions by rail or canal, is very cheap, condensing facilities are often of a limited character and power is wanted, so to speak, close to the door of the power station, so it has been said with reason that "the transport of large quantities of energy at very high tension cannot be economically justified."* The concentration of consumption in some regions is so great, for example in the Sambre area around Charleroi, that within range of primary distribution pressures, clients can be found requiring power to the extent of 25 000 kW for 3 500 to 4 500 hours a year. "It is realised that once an output of 25 000 kW is arrived at, the reduction of the cost of energy from the use of larger power units does not compensate for the extra expenses from transmission at very high voltages."* In the Meuse area and lower Scheldt a number of central stations exist, the multiplicity of such stations leading to the desirability for interconnection. Fig. 1 shows a map of interconnections taken from a report by M. Uytborck presented to the High Tension Conference in 1929.

A little over three years ago, in our Parliament the situation in Belgium was extolled, non-technical members of Parliament being given to understand by implication that the power consumption in that country put our supply authorities almost to shame, and that the country was equipped with a vast grid system fed with power from super stations. The figures then used were obtained by ignoring the analyses available showing that much of the power included in published statistics was that used in private works, the huge power stations and most of the grid system existing only in the fertile imaginations of professional politicians.

Before and after the war a material proportion of the power systems of Belgium has been in the hands of undertakings allied to the group formed by the late Baron Empain, who also owned the largest cable works in the country. A material

number of comparatively long cable lines have been put down, and in some ways the regulations regarding overhead lines have been more stringent than those in France; on the other hand, conditions regarding subsoil, as in Holland, favour cable construction. A cable line 60 km. (37 miles) long joins Langerbrugge with Zeebrugge at 36 kV, a similar pressure being used in cable between Ostend and Bruges. During the last few years about 305 km. of interconnecting overhead line has been put up at 50 kV, and in 1929 87 km. (54 miles) at 70 kV. The cost of the interconnecting systems, including that under construction with that of transformer and linking up stations, reaches about 120 million Belgian francs, and in 1927, despite an increase in output of 22%, the plant capacity in public cum private industrial stations only increased by 7%. The cost of the interconnection, after allowing for interest and upkeep, is 0·01 frs. per kilowatt hour. "One cannot claim to solve the problem of the electrification of a country like Belgium by constructing a system of interconnecting lines at very high tension receiving its energy only from five or six central stations."*

It is not expected that the creation of a number of inter-

connecting lines will profoundly modify the production characteristics. The operation in parallel of central stations has not given rise to special difficulties; it is anticipated that some lines at 120 kV will be constructed later.

Although the power stations in Belgium are small it does not follow that they are out of date, for example M. Herry, of the Langerbrugge station, near Ghent, has carried out pioneer work regarding high pressure steam turbines, with a two-stage pipe range.

Fig. 3 shows the central station at Alost of the Société Intercommunale Belge d'Electricité. It is operated with pulverised fuel, as can be seen, a step-up transformer station and outgoing line at 50 kV; the type of trelliswork steel tower shown is much used in Belgium.

Fig. 2 is a line of the Liège District Company. The standards are made up of two channels filled in with concrete, in construction it is something like the Australian Stoby pole.

In the Hainault district a number of centrifugal concrete posts are in use on lines of 70 kV; they were made in France on the "Forclum" system.

The nature of the country affects the type of line construction adopted. The northern half of the country is low lying, water can usually be found within almost a few inches of the surface, whereas in the south the ground is more hilly and in the rural areas of the Ardennes very rocky. The question of the foundations for large supports is a matter of interest; some are made of concrete blocks nearly cubes in shape, others are made of concrete slabs 50 cm. (20 in. thick) placed 20 in. below the surface; those supports which have to resist an overturning moment of 25 tons have slabs 10 ft. by 10 ft., with the aid of 20 in. of soil placed on the top. Aerial conductors for high tension must be stranded; chain insulators are the rule at 50 kV and over. Generally, with high tension lines, an earth wire is placed above the conductors.

Around Liège a number of steelmakers, and others owning works power stations, have arranged a co-operative mutual supply organisation quite apart from the public supply system, on lines somewhat similar to a system in the French Briey ironworks area, which was described a few weeks ago in a paper read before the Institution of Electrical Engineers. The power stations are interconnected and surpluses are utilised.

Cordial thanks are due to M. Uytborck, of the Belgian Union of Power Authorities of Brussels, for supplying the writer with a number of interesting points for the preparation of these notes. A report by him, presented to the High Tension Conference on Belgian Interconnection, with plan, was also utilised, from which the sentences marked with an asterisk are taken.

LINE ACCESSORIES.

Switches and Fuses—Precautions against Interference.

DURING the last ten years a material demand has sprung up at home for appliances for use with overhead lines, and while Continental and American influences can be seen in many designs, yet the difficult climatic conditions, the gusty winds, the dampness, fogs, and salt-laden atmosphere met with in places, and in some areas the fumes and greasy soot, make careful design and construction a *sine qua non*.

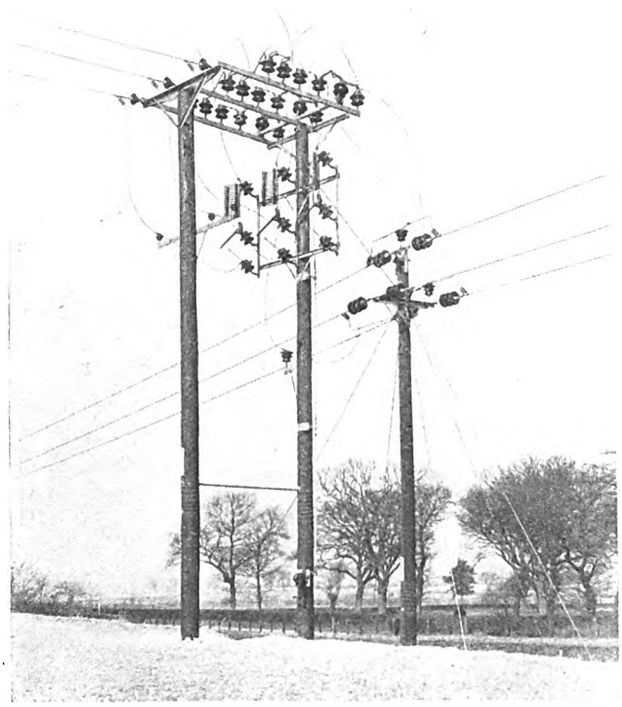

Fig. 1.—Aerial switch at head of a branch.

Oil switches of the normal type are expensive, especially for 33 kV and upwards, and there are many positions where their cost would not be justified. Aerial switches are useful as section links and as branch and transformer isolators, and are employed at substations in connection with busbar combinations.

A set of gear for use at the head of a branch at 11 kV is seen in Fig. 1. The line on the right is designed for 33 kV. The branch connections first pass through an aerial horn switch to which a horn arrester and solid resistance is connected; the circuits pass through choke coils and J. P. bomb fuses and then to the outgoing line on the left. By opening the aerial switch from below the main gear can be made dead. The layout is designed so that the 11 kV branch can be connected through a transformer to the main line, which will then operate at 33 kV.

There are various forms of fuses used on overhead lines; for some time abroad porcelain tubes with contacts at both ends and silver fuse wires had considerable vogue, some makes nowadays use bakelite tubes instead of porcelain as being less likely to burst when dealing with a short.

The Horn fuse, a modification of the original Siemens lightning discharger, utilising the magnetic outwards-blowing effect to clear the arc, still has some popularity at home and abroad. The Carbon Tetrachloride fuse, which had its origin in America, which uses the power of a released spring to drive the quenching liquid into the arc, has seen material development; it is perhaps more desirable out of doors than under cover.

Messrs. Johnson and Phillips have recently developed a bomb fuse (Fig. 2) and have put it on to the market after a series of severe tests. The fuse made of lead wire breaks circuit inside a brass tube with a bakelite extension, lined with a special cement. When fusing, owing to the great heat, the gases expand with explosive violence, blowing out the arc and breaking the circuit effectively. The fuse can be quickly rewired, the lead wire is threaded through and connected to a screwed plug in the explosion chamber.

A type of aerial switch made by Messrs. Isenthal and Co., of Acton, is of interest; Fig. 3 shows one phase section. There is one set of fixed and a set of moving contacts which swing backwards about an axle mounted in bronze bearings. The contacts are fixed to the insulator heads by means of malleable clamps, made in halves and screwed up at the sides, a layer of lead being used to prevent excessive local mechanical pressure. The caps are made so that the clamp rings do not carry the main current. The horns which are of the loop type, are made with a slight twist to give stiffness. The connection between the swinging insulator and the fixed
